FOREWORD TO THE 1971 REISSUE

Responding to widespread demand from librarians and other researchers, The H. W. Wilson Company has brought back into print the six early volumes of Current Biography Yearbook, 1940-45. Although their style and format depart considerably from present editorial policy, the volumes constitute a rich source of information on persons of the World War II period. They provide contemporary viewpoints on major world figures and furnish valuable leads to further research into the lives of a host of authors, organization heads, war correspondents, and women military leaders. And their reference value is enhanced by photographs that are difficult or impossible to come by elsewhere. The Company is pleased to make these volumes once again available to serve the research and reference needs of the scholarly community.

Charles Moritz

Preface

Current Biography began publication a few months after the outbreak of World War II. And of this volume, its sixth Yearbook, it might be said that it presents the last of "the Captains and the Kings" whose records are an important part of the history of those war years. Also prominent among the thirty-one professions represented in this volume are the fields of politics, education, the arts, and science. In the last-named classification appear some of the names which, together with their "now-it-can-be-told" work, became headline news after the war.

All the biographies which have appeared in Current Biography during the six years are listed in the "Cumulated Index—1940-1945" at the back of this volume. Users of this Yearbook should therefore consult that index if this annual does not contain the biographies they wish to read. The index will show, for example, that the biographies of the present Secretary of State, James F. Byrnes, and scientist Harold C. Urey appear in the 1941 Yearbook; and that General Eisenhower's biography is contained in the 1942 volume. Reference librarians will find the six-year index of even more value than before: it now includes references to the monthly issues as well as to the Yearbooks published since 1940.

Like the volumes of the past five years, 1945 Current Biography Yearbook is a one-alphabet cumulation of the biographical articles and obituary notices that appeared in the year's monthly issues. However, before the articles were reprinted in the Yearbook, they were revised, when necessary, to include events that occurred in 1945 after the publication of those articles in the monthly numbers. While many biographies were thus rounded out as of December 31, 1945, that deadline of necessity left some matters pending at the close of the year.

The assembling of material for these biographies entails thoroughgoing research. Files of clippings are drawn upon when a name is selected for inclusion in Current Biography. Indexes to magazine articles and books guide writers to a mass of information which is culled for biographical and background facts. Various "Who's Whos," encyclopedias, and other reference works contribute data. Information is also obtained from government offices and a variety of commercial and educational organizations. Whenever it is possible to get in touch with the subjects of the biographies, they are asked to confirm or correct facts; it should be pointed out, however, that these are not authorized biographies. The biographees, too, may send their photographs, although a number of the prints are procured from duly credited photographers. The Press Association, Inc., 50 Rockefeller Plaza, New York, is the source of those photographs not supplied by biographees or photographers.

The following members of CURRENT BIOGRAPHY's regular staff shared with the editors in the preparation of this Yearbook: Daisy Baum, Edith Faigman, Marian Prince, and Dana Rush; other writers and revisers who assisted were Ethel Ashworth, Ruth Lechlitner, Frances Rosenberg, Frances Wallace, and Alberta Worthington.

Classification by Profession—1945 711

Cumulated Index—1940-1945 717

Explanations

Authorities for biographees' full names, with few exceptions, are the bibliographical publications of The Wilson Company. When a biographee prefers a certain name form, that is indicated in the heading of the article. For example, "Nelson, (John) Byron (Jr.)" means that Nelson prefers to be called Byron Nelson; and when a professional name like "Pickford, Mary" is used in the heading, the real name—in her case Gladys Mary Smith—appears in the article itself.

The heading of each article includes the pronunciation of the name if it is difficult, date of birth (if obtainable), and occupation. The article is supplemented by a list of references to sources of biographical information, in two alphabets: (1) newspapers and periodicals, (2) books. Space limitation requires that these bibliographies be kept short, but an effort is made to include the most useful references.

References to newspapers and periodicals are listed in abbreviated form; for example, "Sat Eve Post 217:14-15 S 30 '44 por" means *Saturday Evening Post,* volume 217, pages 14-15, for September 30, 1944, with portrait. (See the section "Periodicals and Newspapers Consulted" for full names of the publications.) The books given as references are limited to those of a biographical nature, including such reference works as *Who's Who in America, Living Musicians,* etc. (See the section "Biographical References Consulted" for complete list.) Each obituary notice includes full dates when that information is available, and the reference is to the New York *Times.* When a name in the body of an article is followed by ’^{40}, ’^{41}, ’^{42}, ’^{43}, ’^{44}, or ’^{45}, the reference is to the CURRENT BIOGRAPHY Yearbook in which a biography of that person appears.

As indicated in the table of contents, this volume contains three name indexes, the purposes of which are self-evident. The all-inclusive index—the cumulated index to the biographies and obituary notices in the six volumes of CURRENT BIOGRAPHY published thus far—includes references to monthly issues as well as to Yearbooks.

CURRENT BIOGRAPHY

1945

ABDULLAH, ACHMED (ăb-dōōl'ä äk'-mĕd) 1881—May 12, 1945 Author and adventurer, of Russian-Afghan parentage; many of his short stories, novels, and plays were based on his years of service in the British Indian and Ottoman armies; the play *The Grand Duke* (1921), the screen version of *The Lives of a Bengal Lancer* (1935), and his autobiography *The Cat Had Nine Lives* (1933) are among his best-known works.

Obituary

N Y Times p20 My 13 '45 por

ACKERMAN, CARL W(ILLIAM) Jan. 16, 1890- Educator; journalist

Address: b. Pulitzer Bldg., Columbia University, New York City; h. Briar Patch, Lambertville, N.J.

Dean of the Columbia University Graduate School of Journalism since 1931, Carl W. Ackerman has been a vigorous champion of freedom of the press—in war and in peace—as an expression of the will of the people in a democratic nation. In 1945 he was one of a committee of three men prominent in American journalism chosen to tour the world on behalf of a free press.

Carl William Ackerman was born in Richmond, Indiana, January 16, 1890. He is the son of John F. and Mary Alice (Eggemeyer) Ackerman. After attending the University of Indiana for one year (1910), he entered Earlham College at Richmond, where he took his B.A. in 1911. (He received his M.A. in 1917.) In 1912 he went East to study at Columbia University's new School of Journalism, and, as a member of its first graduating class, received his B.Litt. the following year. He has since been awarded LL.D. degrees by the University of Richmond, Northwestern University, and Earlham College.

Ackerman's work as a journalist began in 1915, when he became a correspondent for the United Press. After the First World War began he was a special writer for the New York *Tribune*, in 1917, and the following year he became correspondent for the *Saturday Evening Post*, covering Mexico, Spain, France, and Switzerland. In 1918-19 he was correspondent for the New York *Times* with the Allied armies in Siberia. On his return to the United States in 1919 he became director of the Foreign News Service for the Philadelphia *Ledger*.

Ackerman left the newspaper field in 1921 for what was to be a period of ten years. Until 1927, as president of Carl W. Ackerman, Inc., he handled corporations' public relations; and in 1930-31 he served as assistant to the president of General Motors. Then, in 1931, Ackerman was appointed dean of the nineteen-year-old Columbia University School of Journalism, from which he had been graduated eighteen years before. At the time the school was founded (through Joseph Pulitzer's gift of two and a half million dollars) it offered a four-year undergraduate course leading to a Bachelor of Literature degree; five years later two years of college were made a prerequisite of admission. The year after Ackerman became dean, plans were developed for its conversion into a graduate school. During the transition period the Bachelor of Science degree was offered to those students having three years of college and two years of study in the school. Since 1935, except in a few special cases where students have had professional experience, a baccalaureate has been required, and then after completion of a one-year course students receive the M.Sc. degree. Perhaps the most widely known undertaking of the school is the annual recommendation of its Advisory Board of candidates for the ten annual Pulitzer Prizes, awarded, in accordance with Pulitzer's will, in the fields of journalism and letters.

CARL W. ACKERMAN

In October 1943 Dean Ackerman announced the establishment in Chungking of the graduate School of Journalism, affiliated with the Central Political Institute of China. Columbia University was sponsoring the school, in part through two anonymous gifts to the trustees. Ackerman had assisted in procuring funds and materials, and Professor Harold L. Cross of

ACKERMAN, CARL W.—*Continued*

his faculty went to Chungking to head a staff of seven Americans and one Chinese. The school continued in operation until August 1945, when, upon the surrender of Japan, it was suspended.

By numerous addresses and articles during his years as dean, Ackerman has dealt with his major concern—freedom of the press. He has spoken, too, of the need for a journalism foundation in the United States "dedicated to the study of the daily newspaper and government. We need scientific studies of the press, by the press, and for the press," he said in 1936, "which will contribute to the progress of journalism as the great educational foundations have advanced medicine."

In April 1938 one of Ackerman's statements against censorship was made in an open letter to Otto Dietrich, then the Nazi press chief, who had proposed international treaties with Germany providing for government control of press and speech as a way to preserve peace. "No nation has ever been able to create confidence in its money by government decree," Ackerman wrote. "The same conditions apply to the printed and the spoken word as a medium of exchange between nations. . . .Good news, meaning truthful information, always has and always will drive bad news, meaning false information, out of circulation."

During the war years, too, Dean Ackerman spoke out strongly against what he described as attempts to "freeze" the press under the guise of preserving national security. To him such censorship was an attack upon America's traditional democracy, and he recalled that in 1933 he had "urged the newspapers of the United States to advocate and support a plan for the establishment of freedom of international news as a new approach to peace." He took a firm stand against any abrogation of the Bill of Rights in the war emergency, and he also declared in March 1941 that the Lend-Lease bill would give to President Roosevelt '42 the power to set up a censorship of news and opinion unjustified by any defense need. Ackerman saw the Wage-Hour Act as another danger to a free press, and when it came up for consideration in July 1940, he presented the plea of the American Association of Schools and Departments of Journalism for recognition of journalism as a profession rather than a trade under the act. The legislation, he said at the time, represented the culmination of "a long series of moves by the Federal Government to control the press of this country," and warned that newspapers must challenge every attempt to regulate the wages and working hours of their employees.

Late in 1941 Dean Ackerman left for Buenos Aires to study the South American press under war conditions. It was a fourteen-thousand-mile journey down the east coast of South America, with stops in Trinidad, Uruguay, and Brazil. "I traveled as an educator, not on a Government mission," he said. On his return in March 1942 Ackerman made a report, as a private citizen, to the Government. Summarizing the results of his observations, he said that Americans must recognize, as a nation, that they had a southern flank, which might become a southern military and naval front. He pointed out that delivery of supplies to these countries had been promised, but too many "cultural missionaries from Hollywood" were sent instead.

A committee of three editors was appointed in December 1944 by John S. Knight '45, president of the American Society of Newspaper Editors, to make a world tour in the interests of a free press. The appointees were Wilbur Forrest of the New York *Herald Tribune*, Ralph McGill of the Atlanta *Constitution*, and Dean Ackerman. The purpose of the trip, which was approved by the Government, was to urge the inclusion in peace treaties of a pledge that governments "will not censor news at the source; not use the press as an instrument of national policy: and permit a free flow of news in and out of signatory countries." It was the first time in history that such a mission had been undertaken. The committee visited England first, also interviewing there officials of three exiled governments—the Netherlands, Norway, and Czechoslovakia—who insisted upon the establishment of a free press in all enemy countries immediately after occupation. The Americans then went on to Paris, Brussels, Rome, Athens, Cairo, Jerusalem, Moscow, and Chungking. Ackerman remained in Chungking for a time to plan the schedule of the next academic year of the journalism school; on his return trip he visited the fighting fronts in the Philippines.

Having arrived in the United States in May 1945, the three-man committee of editors submitted on June 10 a fifty-thousand-word report on their survey of freedom of the press sentiment in other nations. In general, the committee found many governments "controlling the press politically under the guise of war security." It received pledges from government leaders for postwar press freedom, but some of these were described as "lip service." It found that people in Italy and Germany, as a result of a controlled press, knew little or nothing of the world around them. The committee also said that several editors abroad believed that the American press was dominated by advertisers; and that newspaper "trusts" directed much of American thinking along undemocratic lines. Further, said the Soviet editors, many articles in American journals were "not the truth." United States diplomatic and information officers complained to the committee of editors that American news services, such as the A.P., the U.P., and INS, were "screening" the news politically. In conclusion, Ackerman and his colleagues proposed that a postwar world conference on freedom of the press be held in Australia.

Dean Ackerman has lectured and participated in other activities in the journalistic field. He lectured on public opinion in 1935-36 at the Tokyo Imperial University, the University of the Philippines, and the Sorbonne. The following year he became an honorary professor at the Argentine School of Journalism, and the same year made a study of the press, radio, and motion pictures in seven Central and South American countries. In 1937 he also organized the system of Maria Moors Cabot Prizes which Columbia University awards annually to those publishers, editors, or writers in the Western Hemisphere who have contributed the most to understanding among the peoples of the hemisphere.

From his experiences as a correspondent during the First World War, Ackerman wrote three books: *Germany, the Next Republic?* (1917), *Mexico's Dilemma* (1918), and *Trailing the Bolsheviki* (1919). In 1924 came a biography, *Dawes, the Doer*, and in 1930 a study of George Eastman, the perfecter of film photography. The last named was called by the New York *Herald Tribune* critic "objective in the sense that it holds strictly to the drama of events in justification of its hero. This makes it eminently readable, even exciting at times, purely as an epic of success achieved . . . a sort of Pilgrim's Progress of business."

The "suave, self-reliant, businesslike" Dean Ackerman received the degree of Doctor *honoris causa* from the University of Havana in 1944. In 1914 he was married to Mabel Vander Hoof. They have one son, Robert Vander Hoof, assistant professor at the postgraduate school of journalism in Chungking.

ALLEE, MRS. WARDER CLYDE *See* Allee, M. H.

ALLEN, FRANK A(LBERT, JR.) June 19, 1896- United States Army officer

Address: b. c/o War Department, Washington, D.C.; h. 1421 N. 12th St., Arlington, Va.

The United States Army's director of public relations in the European theater from August 1944 to August 1945 was Brigadier General Frank A. Allen. In his position as chief of the Public Relations Division of Supreme Headquarters, Allied Expeditionary Force, General Allen, who has had a long military career, was charged with great responsibility in the release of war news to the public. When he was appointed to this post one magazine remarked that Allied newspapermen "saw things change for the better." However, after the German offensive began in December 1944, Supreme Headquarters were the scene of stormy sessions between war correspondents and public relations officers on the subject of military censorship. Primarily concerned with safeguarding military security, Allen followed a strict course in releasing news.

An Ohioan, Frank Albert Allen, Jr., was born in Cleveland, June 19, 1896, the son of Frank Albert and Anastasia G. Allen. He attended Kenyon College in Ohio in 1916 and 1917, when his academic education was halted by America's entry into the World War. Young Allen attended the Officers Training Camp at Fort Benjamin Harrison, Indiana, for three months and was commissioned a second lieutenant in the Infantry Reserve on August 15, 1917. He was assigned to the Fifty-eighth Infantry and in September he went to the Fourth Machine Gun Battalion of the Second Division at Gettysburg, Pennsylvania. Within a month Allen had received his commission as second lieutenant in the Cavalry of the Regular Army, and simultaneously he was promoted to the temporary rank of first lieutenant. This appointment was made permanent in September 1919, and a year later he attained the permanent rank of captain. (During the following twenty-three years he held four successive ranks until his promotion to brigadier general [temporary] on September 11, 1942.)

In his long career in the Army, Allen has seen distinguished service both in the United States and abroad. He first left American shores in a military capacity in May 1918, when he went to France with the Seventy-seventh Field Artillery. With this regiment he served in the Aisne-Marne, Oise-Aisne, Saint-Mihiel, and Meuse-Argonne engagements. After the signing of the Armistice, Lieutenant Allen was assigned to the American Forces in Germany, stationed at Neuenahr. His next assignment came in July 1919, when he joined the Courier Service, which carried confidential documents between the scattered headquarters of Allied governments and armies in Europe. That

U. S. Army Signal Corps

BRIG. GEN. FRANK A. ALLEN

November Allen served with the Typhus Relief Expedition in Coblenz and Warsaw.

On his return to the United States in December 1919 Lieutenant Allen was assigned to the Thirteenth Cavalry at Fort Clark, Texas. The following year he became a cavalry instructor at the Infantry School, Fort Benning; Georgia. He left Georgia after a year to become a professor of military science and tactics at Norwich University in Vermont. Then, resuming his advanced military education in 1923, Allen entered the Cavalry School at Fort Riley, Kansas. He was graduated the following May, at which time he was assigned to duty with the Operations and Training Division, G-3, of the War Department General Staff in Washington, D.C.

In 1926 Captain Allen became aide to Major General Dennis E. Nolan, then deputy chief of the War Department General Staff. In this capacity Allen accompanied General Nolan to three posts: Fort Hamilton, New York; Fort Hayes. Ohio, in 1927; and Governors Island. New York, in 1931, where he remained for two years. Allen was then ordered to Fort Myer, Virginia, for duty with the Third Cavalry, a post he held until his entrance into the Command and General Staff School, Fort Leavenworth, Kansas, in September 1935—a month after his promotion to the permanent rank of major. After his graduation a year later he went to Fort Riley, Kansas, where he served on the faculty of the Cavalry School until his transfer in 1938 to the Ninth Cavalry at the same post. In September 1939 Major Allen entered the Army War College in Washington, D.C.

After completion of the course Allen was assigned to the Public Relations Branch, Office of the Chief of Staff, and in February 1941 became chief of the Pictorial and Radio Branch of the War Department Bureau of Public Relations. Two months prior to this appointment he had been made colonel (temporary). (In August 1940 he had been made lieutenant colonel.) August 1941 found Allen stationed at Fort Knox, Kentucky, on duty with the headquarters of the Armored Force. Here he served with the First Armored Division, and upon activation of the Fifth Armored Division in September he was given command of one of its units, the Eighty-fifth Armored Reconnaissance Battalion. He changed commands in February 1942, when he was assigned to the Thirty-fourth Armored Regiment of the Fifth Division. In August 1942 Allen assumed command of Combat Command A, Ninth Armored Division, Fort Riley, Kansas. A month later he was made brigadier general (temporary).

The General's first overseas assignment in the Second World War came in June 1943. He served as combat commander of the First Armored Division in the North African theater of operations until August 1944. At that time he was assigned to Supreme Headquarters, Allied Expeditionary Force, in the European theater, where the following month he was named chief of the Public Relations Division. In his Paris post Allen was confronted with serious public relations problems, for SHAEF had been sharply criticized for the handling of war news. One newspaper reported that "the difficulties appear to grow out of the fact that no satisfactory cooperative procedures for the handling of important news has been worked out by the United Nations or the United States." These difficulties culminated in early 1945 in the assignment of Stephen T. Early '41 to conduct a survey of the situation. At Allen's invitation, Early, as President Roosevelt's '42 aide, reviewed public relations affairs at SHAEF in Paris, acting in a civilian advisory capacity.

One of the major controversies in SHAEF's relations with the press occurred in December 1944 when the American war correspondents attached to SHAEF became indignant at the withholding of news of the Nazi offensive. *Time* Magazine, in discussing that affair, declared: "In the bitter confusion of the German break-through the Army clamped down a censorship thicker than the pea-soup fog that shrouded the great German counterattack. Communiques were as much as forty-eight hours behind the event. When they came they were meager and vague. Correspondents blew up." During those days of military secrecy Allen continued to assure the irate journalists that the Army's policy was based on security needs. He defended the news "blackout" and declared that the decision on policy had been made by the First Army and the Twelfth Army Group, supported by SHAEF and G-2 (Army Intelligence). However, it was reported that General Allen himself had tried to have the news restrictions lifted. Lively scenes between war correspondents and public relations officers were described in the press. One magazine in reporting the outcome of this situation wrote, "The wrangling bore fruit . . . SHAEF decided to give a daily report of action which has taken place forty-eight hours previously. On December 23 the blackout was lifted."

There were further public relations difficulties on the active European front. Heated argument on the part of the press concerning the release of news followed the Allied counteroffensive. James F. McGlincy, writing from

Paris on January 5, 1945, said: "Both SHAEF and front-line correspondents protested bitterly that British Broadcasting Corporation broke a security blackout on news of the offensive, presenting the news eleven hours before a previously fixed deadline." Further confusion between SHAEF and the press resulted from the handling of the news of the shift in the commands of Field Marshal Sir Bernard L. Montgomery '42 and Lieutenant General Omar N. Bradley '43. The circulation of this news in the United States by *Time* Magazine and the United Press in advance of the official release of the story brought a storm of protest from correspondents. At this time Allen stated that the delay in the announcement of this news had been based entirely on military security. The affair resulted in an immediate investigation by SHAEF and the controversy was prominently featured in American newspapers. Discussing the war news on January 7, 1945, *PM* stated: "Another battle, the battle of SHAEF, continued at Allied Supreme Headquarters in Paris. The opponents were the American correspondents, who charged that SHAEF policy was giving the United States public a distorted and confused picture of the situation, and the Army press officers, carrying out orders from higher up, who continued to plead military security—if they defended themselves at all."

With the premature announcement of the German Government's unconditional surrender, made on May 7 by Edward Kennedy, chief of the Associated Press's Paris Bureau, the issue of freedom of the press and the public's right to the news as soon as it breaks again made considerable stir. Kennedy, without informing the other reporters assigned to the capitulation, flashed the momentous news to the world despite the pledge the newsmen had made to General Allen that they would not release their copy until sanctioned by SHAEF. Allen almost immediately penalized the A.P. by suspending its news filing privileges throughout the European theater, though the order was later rescinded for all A.P. personnel with the exception of Kennedy, after strong protests were received from the American press. A group of fifty-four SHAEF correspondents called Kennedy's scoop "the most unethical double cross in the history of journalism," and General Eisenhower '42 authorized Allen's statement that the A.P. newsman had placed the Supreme Commander in "the position of having broken an understanding" with the Russians concerning the announcement and imperiling the negotiations. Allen declared that Kennedy had deliberately violated security measures, involving possible loss of American and Allied lives. Kennedy contended that, "since it was conceded [by the chief American press censor] that no military security was involved" and that he "regarded the suppression as purely political censorship," he "therefore could not be bound by it." In the official investigation following, Kennedy was adjudged to have "deliberately violated the trust reposed in him by prematurely releasing through unauthorized channels and deliberately evading military censorship a news story concerning which he was pledged to secrecy."

The incident raised the question in SHAEF headquarters of the extent to which newsmen would have access to news of the most secret character. In the end, General Allen's recommendation of continuance of the past policy was approved by General Eisenhower, when Allen assumed personal responsibility for the good faith of each press representative permitted access to such stories. Friction between Army officials and the press continued, however, as several correspondents who made unauthorized visits to Berlin were placed on the suspension list. On May 28 Eisenhower awarded General Allen the Legion of Merit for "meritorious conduct in the performance of outstanding service"; "the sound judgment constantly demonstrated by this officer reflected great credit upon the United States Army," continued the citation.

When Supreme Headquarters, Allied Expeditionary Force, were dissolved on July 14, 1945, the United States, British, and French forces reverting formally to their own commands, General Allen became head of the public relations division of United States Forces, European Theater. In August he was assigned as acting commander of the Third Armored Division at Frankfort on the Main.

Square-jawed, battle-seasoned, he is called "Honk" for his "105-mm. larynx." The General and his wife, who was Ellen Gordon, were married May 10, 1922. They have four children, Walter Gordon, Laura Doan, Mary, and Frank Albert, 3d. Allen is a member of the Beta Theta Pi fraternity and his clubs are the Army Navy Club in Washington and the Army Navy Country Club in Arlington, Virginia. He has been called "a professional soldier who prefers combat to conferences."

Who's Who in America, 1944-45

ANDERSON, CLINTON P(RESBA) Oct. 23, 1895- United States Secretary of Agriculture

Address: b. Department of Agriculture, Washington, D.C.; h. Lazy V Cross Farm, R.F.D. No. 1, Albuquerque, N.M.; 6 Wesley Circle, Washington, D.C.

The vital food problems of the United States were the first important concern of the new Secretary of Agriculture, Clinton P. Anderson, after his appointment to the post by President Truman '45 in May 1945. This Democratic Congressman from New Mexico replaced Claude R. Wickard '40 and also assumed the duties of Marvin Jones '43, War Food Administrator. At the time he announced the Cabinet changes, the President revealed that the War Food Administration would be transferred to the Department of Agriculture in an effort to unify action on the food situation.

The Secretary of Agriculture has inherited a tradition of farming from his Swedish father, who immigrated to America to settle on the sloping plains of South Dakota. There, in the town of Centerville, Clinton Presba Anderson was born to Andrew Jay and Hattie Belle (Presba) Anderson on October 23, 1895. Clinton attended Dakota Wesleyan University from 1913 to 1915, after which he studied for a year at the University of Michigan. (Dakota

CLINTON P. ANDERSON

Wesleyan University conferred an honorary L.H.D. degree on him in 1933.) At the time of America's entry into the First World War, Anderson was engaged in prelaw studies. He applied for service but was rejected for officer training because of a lung condition. This illness also prevented the young man from being graduated and sent him south to New Mexico. Settling in Albuquerque, Anderson rapidly recovered his health and went to work for the *Journal* as a reporter and editor from 1918 to 1922. When a relapse forced him to spend more time outdoors he turned to selling insurance, later becoming manager of the insurance department of the New Mexico Loan and Mortgage Company. In 1925 Anderson acquired his own insurance agency, which he developed successfully; he is today president of the Mountain States Mutual Casualty Company.

Anderson first held public office in 1933 when, at the sudden death of New Mexico's State treasurer, the Governor appointed the insurance executive to fill the vacancy. He was again called to State service in 1935 when there was serious trouble in Albuquerque over relief problems. The Governor put Anderson in charge of the New Mexican Relief Administration, and order was soon restored. As relief administrator, he aimed foremost at equitable distribution of funds and required that the applicants work on public projects in return for assistance. His performance in this capacity led Anderson to the job of field representative of the Federal Emergency Relief Administration, a post he held for a time in 1935-36. From this position he advanced to become chairman and executive director of the Unemployment Compensation Commission of New Mexico (1936-38). The businessman also served as managing director of the United States Coronado Exposition for the year 1939-40, a celebration commemorating the Spaniard's explorations in the Southwest.

In 1940, for the first time, Anderson became a candidate for office, winning election as Democratic Representative at Large to the Seventy-seventh Congress. He was afterward re-elected to the House twice. (The last time he ran for office rather reluctantly, since he had planned to retire from public life.) In viewing his career, *PM* called him a "better-than-average Congressman," and the *United States News* refers to him as a "liberal in politics but not a New Dealer." Anderson gained prominence in the House in three principal issues: his support of the Federal soldier-vote bill, his investigation of campaign expenditures, and his food investigation.

A record of "mixed" votes characterized Anderson's Congressional career. In 1941 the Democrat registered his assent to amendment of the Neutrality Act, and after that he voted for UNRRA and extension of reciprocal trade agreements. On the domestic front, Anderson charged in a House speech in July 1942 that the President had failed to carry out his own seven-point program to prevent inflation. He voted in 1943 for the bill to increase the public debt limit and to revoke the $25,000 salary limit, and that year he also voted in favor of the Hobbs anti-racketeering bill, the anti-strike bill, and against subsidies and the Ruml '43 tax plan. Anderson led a House group in support of a pay-as-you-go tax measure. He voted to override the Presidential veto of the anti-strike bill, and to sustain the veto of the commodity credit bill. In 1944 he led a campaign to secure a record vote on the Worley Federal ballot bill: He drew up a petition which was signed by one hundred and twenty Democrats favoring a yea-and-nay vote on the issue of servicemen's votes. During that year he also voted against the ban on food subsidies, to sustain the veto of the anti-subsidy bill, to override the veto of the tax bill, against the compromise soldier-vote bill, and for investigation of Government seizure of Montgomery Ward's.

In early 1945 the Congressman voted against a permanent committee on un-American activities (formerly the Dies '40 Committee), for limited national service for men between eighteen and forty-five, and in March for the compromise manpower bill. In May Anderson voted against overriding President Truman's veto of the farm-draft deferment legislation. The New Mexican was given some significant committee assignments. In February 1943 he was named to a subcommittee of the House Appropriations Committee (of which he was then a member) to consider cases of subversive activities. In January 1945, at the first Democratic Party caucus of the new Congress, Anderson was elected to the powerful House Ways and Means Committee.

One of his most important committee assignments was in connection with the Campaign Expenditures Committee. As chairman of the committee Anderson led a thorough investigation of groups which influenced the elections of 1944. In September the committee investigated the activities of the CIO's Political Action Committee, visiting the group's New York headquarters. Anderson's committee also inquired into the affairs of the Constitutional Educational League and Gerald L. K. Smith's '43 "Committee of One Million." Reporting Smith's testimony at a committee hearing, one writer stated that Anderson "put Smith through one of the neatest jobs of police court cross-examination on record, leaving the self-styled nationalist leader spinning around in his chair and fumbling for answers to the most embarrassing questions—all asked with the utmost politeness."

In October Anderson charged that thirteen Republican Congressmen had mailed at Government expense over three million copies of a speech made by a Republican Representative. This fact was later cited in a radio speech by President Roosevelt and caused considerable comment. Subsequently, Anderson requested and was granted permission by the House committee to withdraw the report from the record. In the course of its investigation the Campaign Expenditures Committee examined the record of the Gallup '40 poll, listening to testimony by George Gallup and checking the figures of the poll. Chairman Anderson found "artificial coloring" and "dangerous adjustments" in the poll of Presidential votes and advised Gallup that it would be "wise to stick to the facts your poll reveals and let the people do their own interpreting." The investigation conducted by the Campaign Expenditures Committee resulted in some indictments, and in its final report the committee urged "remedial legislation to force purveyors of political propaganda to disclose the sources of their funds and their concrete objectives as distinguished from their abstract professions of faith." The committee's work was applauded in some quarters, but *PM* declared: "Despite the unbiased, thorough investigation conducted by Anderson, his committee's final report placed more heat on the CIO Political Action Committee than on the men and organizations who were held in contempt."

Early in 1945, when the House was discussing the organization of a food inquiry, Anderson insisted that they must get the facts, not only from the farmers but from the entire food industry and all Government agencies concerned. The New Mexican was put in charge of the House food investigation to conduct a complete survey of food conditions. At the outset he told agency chiefs: "We have no ax to grind. We're looking for no witches. Over facts there need be no dispute. Let's have your figures on farm goals and production, supply, stocks, and allocations." For five weeks hearings took place in Chicago, New York, Cleveland, Boston, Providence, and Washington, and a tour of the East and Middle West was made to get information on the meat shortage.

At a White House conference in April, Anderson urged that the Government open and operate closed meat packing plants throughout the Nation. The seven-thousand-word preliminary report of the committee to the President contained "alarming facts," including revelation of black market control of meat in New York and the danger of a black market in poultry and eggs in many other cities. The committee met again with the President on May 2 to discuss recommendations resulting from the meat investigation. The Anderson committee report strongly recommended consolidation of all War Food Administration and Office of Price Administration operations in food control.

The committee then proceeded to a study of the sugar situation. Its second report on this problem, revealing that twenty agencies now have a hand in sugar control, urged that one coordinating head be substituted. This report, termed "a fair and comprehensive picture", pointed to a growing sugar shortage. Anderson favors keeping the public informed on Government food exports to the United Nations. He once told a reporter how he would combat the menace of black markets: "The way to kill off the black markets and food-price inflation is abundant production, and the time to plan abundant production is now."

On May 22, 1945, Anderson was invited to lunch at the White House, where he was asked by the President if he would like to be Secretary of Agriculture. "I almost swallowed my grapefruit," Anderson later reported, adding, "But he gave me a job to do, and when Harry Truman gives you a job to do you do it." The nomination, announced on May 23, was warmly greeted in the House and on May 30 the Senate gave its approval. Press reaction to the appointment was favorable, with many commentators citing Anderson's vigorous food campaigns and noting that he would now have the opportunity to put into practice the recommendations of his committee. The *United States News*, commenting on the new Agriculture Secretary, said, "Food industry will find Mr. Anderson inclined to be 'practical.' Farmers will find that he has no formula for solving all of their problems, no really preconceived ideas on planning." Anderson has assured Congress that he will be "alert to the needs of the American farmer."

Until Anderson assumed his Cabinet seat in July, he continued his food inquiry, and during the month of June the committee schedule included hearings in Omaha, Minneapolis, Yakima, Seattle, San Francisco, and Southern California. During the Congressional debate over whether or not to turn OPA's food controls over to the prospective Secretary of Agriculture, who himself objected to the granting of such power, a conference committee of representatives of both the House and the Senate agreed upon a bill extending the OPA for a year, and giving Anderson the power to supervise regulations, orders, and price schedules applying to all agricultural commodities at the processor's level. In this decision to give the Secretary ultimate authority over food pricing, an earlier House decision to make him food "czar," capable of overriding even an Executive order, was reversed.

When Anderson assumed office on July 1, 1945, he outlined a four-point program for agricultural policy aimed to effect the consolidation of the War Food Administration with the Department of Agriculture, resulting in "an efficient organization serving agriculture and the people"; to coordinate food production and pricing policies for the attainment of maximum production; to obtain equitable distribution of food supplies meeting military, civilian, and foreign relief requirements; to restore food

ANDERSON, CLINTON P.—*Continued*

to legitimate channels of trade through rigid control of black markets and a strict policy of law enforcement. Leading interagency discussions began on plans to end food subsidies in 1946, thereby shifting one and a half billion dollars in food costs to consumer pocketbooks; the objective was to ease adjustment of farm prices to postwar conditions and to reduce Government expenditures. In August Anderson announced a thoroughgoing reorganization of the Department of Agriculture. An early New Deal bureau, the Agricultural Adjustment Agency, passed into history as a new superagency, the Production and Marketing Administration, came into being. Consolidating the functions of fourteen other agencies, this top control unit will have broad powers to coordinate future governmental programs affecting marketing, price, and production policies.

Supporting Truman's legislative program, Anderson on August 23 endorsed the full employment bill, telling a Senate subcommittee that agriculture has a vital stake in the measure; full employment is essential if another farm depression is to be averted, he declared, and the bill's aim of maintaining full employment is "one of the greatest encouragements that Government can give" to businessmen. He went on record as favoring the sixty-five-cent minimum pay standard bill on September 27, noting it as "a step forward in the task of expanding the market for farm products." "For each increase of one billion dollars in the annual earnings of low-income workers there will be a corresponding increase in food expenditures of at least two hundred million dollars." At a conference with representatives of the American Farm Bureau Federation in September 1945, Secretary Anderson indicated that the Government's 1946 farm program will call for some reduction in over-all production in order to keep supplies in line with a prospective smaller peacetime demand.

Anderson headed the thirty-four-man delegation from the United States to the conference of the United Nations Food and Agriculture Organization, which, as the first permanent body to emanate from the UNO, met in Quebec in October. There he spoke on the major problem of the body—"to bring together countries which are desperately hungry and those which are concerned with finding markets for the food they produce"—this to be achieved by the application of scientific production and efficient distribution. For the last quarter of 1945 Anderson was able to predict a 50 per cent increase over the previous quarter's shipment of food to the United Kingdom and liberated Europe, and before the end of the year he had the satisfaction of seeing the lifting of the rationing of all foods except sugar.

The new Secretary of Agriculture is described as "tall, dark, and square of chin," soft-spoken, yet incisive. He weighs one hundred and eighty-five pounds, has brown hair and eyes. His favorite reading is history, particularly that of the Southwest. He belongs to Delta Theta Phi fraternity and is a Mason and an Elk. For many years he has also been an active member of the Rotary Club, in 1932-33 serving as president of Rotary International. The former newspaperman has contributed several articles to the *Rotarian*, the *American Magazine*, *Hygeia*, and others. Mrs. Anderson is the former Henrietta McCartney, to whom he was married on June 22, 1921. They have a son and a daughter, Sherburne Presba and Nancy. The family's New Mexico home is a 935-acre ranch near Albuquerque, where, according to *Time*'s statistics, Anderson has "450 acres of alfalfa, 135 milch cows, and 300 head of Rambouillet sheep." He owns additional land in South Dakota. He is fond of horseback riding, and a hint of one of his indoor recreations is given in the title of an amusing article he wrote in 1937—"Should We Abolish Bridge? No—Never!"

APPLETON, SIR EDWARD (VICTOR)

Sept, 6, 1892- Physicist; British Government official

Address: b. Department of Scientific and Industrial Research, Park House, 24 Rutland Gate, London; h. 39 Westleigh Ave., London

"The biggest single contribution by science to Allied triumph [in the Second World War]," in the opinion of many commentators, is that invention known in Britain as radiolocation and in America as radar. As revealed by Allied authorities, "it remains, despite the atomic bomb, an amazing contrivance, the reason behind countless Allied victories on land, on sea, and in the air, a weapon so formidable that it shortened the struggle against the Axis certainly by months, possibly by years." Defined by the highest-ranking physical scientist of the British Government, Sir Edward Appleton, as "the process of locating the position of an object in space by radio, without any active cooperation on the part of that object," radar has been worked out by the cooperation of many scientists, notably Sir Robert Watson-Watt['45] in Britain and Dr. A. Hoyt Taylor['45], with Leo C. Young, in the United States. Appleton himself originally made many of the discoveries in pure physics which have been applied in the development of radiolocation; and since the outbreak of the war he has been secretary of the British Government's Department of Scientific and Industrial Research.

Edward Victor Appleton, the son of Peter Appleton, was born in Bradford, Yorkshire, on September 6, 1892. After attending the Hanson School there, he went on to Cambridge University, where he was an exhibitioner and scholarship holder of St. John's College. At Cambridge he studied under the renowned physicists Sir Joseph J. Thomson and Lord Rutherford. He took the honors examination, or tripos, in natural science in 1913-14, specializing in physics, and won the Wiltshire Prize in 1913 and the Hutchinson research studentship in 1914. His studies were cut short by the outbreak of the First World War, however, and the young scientist joined Yorkshire's West Riding Regiment. Later he was transferred to the Royal Engineers, serving with the rank of captain.

After the war Captain Appleton returned to Cambridge, where he devoted himself to research on radio waves. For a time he was a fellow of St. John's College. In 1920 he was appointed assistant demonstrator in experimental physics at the Cavendish Laboratory, and two years later he became sub-lector at Trinity College of the university. In 1924 Dr. Appleton (he holds the M.A. and D.Sc. degrees) left Cambridge to become Wheatstone Professor of Physics at the University of London, where he remained for twelve years. Continuing his research, Appleton "repeated a variety of experiments on interference and polarization." Working with short waves in his laboratory and with long waves over distances of miles, to quote the *Encyclopædia Britannica,* "E. V. Appleton has shown that interference phenomena could be obtained with the Hertzian waves used in wireless telegraphy by reflection from the Heaviside layer," an atmospheric stratum.

Since 1896 it had been known that all electromagnetic waves were reflected by all objects; Appleton sought to prove the existence of this Kennelly-Heaviside layer, or "electrical roof of the world," by shooting radio waves at it to see if they bounced back. He worked, then and later, under the auspices of the Government Department of Scientific and Industrial Research. With the cooperation of the British Broadcasting Company, in late 1924 he used the Bournemouth transmitter for this experiment, which was successful. The Heaviside layer, or ionosphere, was identified in space and its height determined by measuring the time required for the waves to return. It was found to be sixty miles above ground; later research has shown that its altitude varies with the time of day.

In 1926 the young physicist discovered a second and electrically stronger nonconducting stratum, ninety miles higher than the ionosphere. The Appleton layer, as it is called, reflects short waves around the earth, and these experiments therefore proved the possibility of direct round-the-world broadcasting. Soon after this Appleton was honored with election as a Fellow of the Royal Society. In 1927 he was also awarded an honorary LL.D. by Aberdeen University, and in 1929 the American Institute of Radio Engineers voted him the Morris Liebman Memorial Prize for his research. In that year his investigations took him to northern Norway to study the aurora borealis. He is also an honorary D.Sc. of the universities of Oxford and Birmingham.

Continuing his study of the reflecting layers of the atmosphere, Appleton used a transmitter which sent out radio energy in bursts, and devised a way to photograph the invisible radio signals by means of a cathode-ray oscillograph. These theoretical findings became the basis for a practical military system of aircraft detection worked out by Robert Watson-Watt and his associates and by researchers who had worked with Appleton. The discovery that an airplane would also bounce back the Hertzian waves made it possible to find the plane's location before it could be seen. In 1933, when radiolocation was still in the future, Appleton was awarded the Hughes Medal by his colleagues of the Royal Society.

Walter Stoneman
SIR EDWARD APPLETON

In 1936 Appleton returned to Cambridge as Jacksonian Professor of Natural Philosophy; three years later, when the Second World War began, he left to accept the secretaryship of the Department of Scientific and Industrial Research, which is described as the senior British Government post concerned with physical science. In addition to proceeding with pressingly important radio research, Appleton studied methods of civilian defense, dehydration, fuel economy, and improvements in items ranging from high-explosive bombs to building designs. Meanwhile, the radiolocation devices based on his findings were making it possible for Britain's outnumbered RAF to meet and conquer the German Luftwaffe. Commentators, in fact, have said that radiolocation won the Battle of Britain. In 1941 King George '43 created Professor Appleton a Knight Commander of the Bath. After the close of the war he was named to two Government committees on science—one to study atomic energy, the other, the use and development of Britain's scientific manpower and resources in the next ten years.

Sir Edward Appleton is president of the International Scientific Radio Union, chairman of the British National Committee for Radio Telegraphy, and a member of the Government committee on television. In 1932 he served as vice-president of the American Institute of Radio Engineers. A Londoner by adoption, Appleton is a member of the Athenaeum Club. He is described as "short, strong, and a tireless worker," and as having "the sturdy figure and balanced mind characteristic of Yorkshiremen." He is married to Jessie Longson, daughter of a clergyman, and has two daughters.

ARMOUR, NORMAN Oct. 14, 1887- Diplomat

One of the most difficult posts for an American ambassador during the war years was in the Spain of dictator Francisco Franco['42]. This ticklish assignment was given in late 1944 to career diplomat Norman Armour, who had been recalled in August 1944 from the Embassy in Argentina as a rebuff to Juan Perón's['44] military regime. Armour assumed his Madrid post in March 1945, but he was not to fill out the year there: In November he announced his wish to retire, after thirty years in the diplomatic service.

Norman Armour, who is not one of the meatpacking Armours, was born October 14, 1887, in Brighton, England, to American parents—George Allison and Harriette (Foote) Armour. Young Norman received his preparatory education at St. Paul's School in Concord, New Hampshire, and went on to Princeton University, from which he obtained his B.A. in 1909. Then, following his graduation from Harvard Law School four years later, he was admitted to the New Jersey bar in 1914. Resuming his studies at Princeton, he received his M.A. degree from that university in 1915.

At the age of twenty-eight, in 1915 Armour passed the State Department's Foreign Service examination and was appointed as attaché of the United States Embassy in Paris. Here he was a member of a neutral diplomatic staff in a country at war, as he continued to be when he was transferred in 1916 to Petrograd (now Leningrad) as third secretary of the Embassy. Before he left Russia Armour, who became second secretary in 1917, was to see the disintegration of autocratic and military power in Russia, the two Revolutions of 1917, and, less than a year after the United States had joined the Allies, the signing in March 1918 of the Brest-Litovsk Treaty, which took Russia out of the war.

In revolutionary Russia, diplomat Norman Armour was also to have his share of adventure. He helped a young princess, Myra Koudacheff, flee the country. Then he himself was arrested at Moscow and detained for a month. According to the New York *Herald Tribune*, he escaped and, disguised as a Norwegian courier, made his way across the border into Finland. In 1919 he was married to the Princess, whose Russian title of Knyazna indicates relationship to one of the former ruling dynasties. Mrs. Armour, who looks more American than Russian, speaks unaccented English and three other languages, and loves to pack up and move. Since her marriage she has kept house in a dozen countries, and "never lost so much as a pin in the moving."

The first stop was Belgium, where Armour was second secretary of the American Embassy in 1919 and 1920. From there he was sent to the Netherlands as first secretary of the Embassy in The Hague. Next he filled the same post (1921-22) at Montevideo, Uruguay, from which he was recalled to Washington to assist the Under-Secretary of State. Sent to Rome in 1924 as first secretary, Armour had a box seat at the Fascist revolution and witnessed the emergence of Mussolini['42] as dictator of Italy. Armour's next assignment was to the Far East, to which he went in 1925 as counselor of the American Embassy in Tokyo, and in 1928 he returned to Paris where he remained for four years as Embassy counselor.

In October 1932 President Hoover['43] appointed the tall, aristocratic diplomat as Minister to Haiti; and after the inauguration of President Roosevelt['42] Armour negotiated the Executive agreement of August 7, 1933 which terminated the United States political and financial control of Haiti. Its terms were similar to those of the rejected treaty of September 3, 1932, but it advanced the date of American withdrawal from Haitian administration. In August 1934 the last of the United States marines who had been stationed in the island for nineteen years departed, and their barracks and administrative buildings were presented to the Republic of Haiti. When Armour left in June 1935, after he had suffered an attack of dengue fever, a reciprocal tariff agreement had been signed—marking the beginning of a new cooperative relationship between the two countries, and the end of the United States intervention in the Caribbean.

The choice of Norman Armour as Minister to Canada in June 1935 "gave fresh assurance to Canada that we are sending a representative of our best," said the New York *Times*; and he was "met with the warmest welcome by the Canadian press." After a three-year term in that friendly Dominion, the fifty-two-year-old American was raised to the rank of Ambassador and accredited to Chile, where he was confronted with the problems brought about by a violent earthquake and a bloodless but revolutionary change of government to one based on the New Deal. In May 1939 Freda Kirchwey '42 wrote in the *Nation*: "Mr. Armour is a diplomat of long experience and a person of distinction and charm. For all that, he didn't belong in Chile." She explained that the Government of President Pedro Aguirre Cerda '41, supported by "a liberal-Left coalition of somewhat unstable composition, is trying to build up the wretched economy of the country and at the same time to repair the monstrous physical damage of the earthquake," which effort involved the United States particularly because "the necessary funds can come ultimately only from the wealth of Chile, which is largely in the capacious pockets of American financial interests." Nevertheless, Miss Kirchwey felt, Armour was slow in establishing rapport with the Aguirre Cerda administration.

But the *Nation*'s editor expressed approval of Armour's appointment to Argentina in early 1939. "For Argentina," she wrote, "Mr. Armour seems a safe choice. Relations between that republic and the United States are strained, and several ticklish problems are waiting to be solved. But the country is rich, its Government is strong and conservative, and the problems lie within traditional diplomatic boundaries, where Mr. Armour, by both temperament and experience, is equipped to do his best work." (It is, incidentally, considered a distinction to be appointed to Buenos Aires, the "gayest and most lavish of South American capitals," where "it is axiomatic in the Foreign Service that no man without a private income could hold down the post.")

In Argentina, Armour "rode the ups and downs of United States prestige like a veteran gaucho. . . . His dispatches continued to be unruffled, incisive, informative." In 1940 he was mentioned for the ambassadorship to Great Britain, but remained in Buenos Aires. The following April (1941) he reportedly made a deep impression on Argentine public opinion when he told the local British Society: "From this time forward your [Britain's] blood is our blood, your toil is our toil, your tears are our tears, your sweat is our sweat. . . . I want you to know how deeply our people are with you in this critical hour for democracy." Armour had had occasion earlier to protest anti-United States articles in various pro-Nazi and pro-Fascist newspapers such as the *Pampero*; he took no official notice, however, of the Argentine Government's ban on Charlie Chaplin's '40 *The Great Dictator* (1941), nor its approval of an anti-United States film, *Petroleo*. Some Americans thought the Ambassador should have taken a firmer stand; but *Time*, announcing the marriage plans of his only child, Norman Armour, Jr., in May 1941, identified the father as "Norman ('The Ideal Diplomat') Armour."

The position of the United States representative in Argentina became more difficult after his country had joined the United Nations in December 1941, for the Argentine Government was determinedly neutral; the population, largely of German and Italian origin, in addition to the descendants of Spanish settlers, included a large number of Axis sympathizers; and the United States high-tariff policy had created a certain amount of antagonism. A reciprocal trade agreement, sought by the United States since 1939, had, however, been signed in October 1941. Two days after Pearl Harbor, Acting President Ramón Castillo '41 joined the other American republics in decreeing that the United States was not to be treated as a belligerent (and therefore not subject to the appropriate restrictions); but at the Rio de Janeiro Conference of Ministers of Foreign Affairs in January 1942 it was Argentina, with the assistance of Chile, which prevented the passage of a resolution calling for an immediate and unanimous break with the Axis powers. To quote the historian Graham H. Stuart, "Buenos Aires soon became the center of Nazi activities for all South America to such an extent that they endangered both lives and shipping in the Western Hemisphere. . . . In November 1942 United States Ambassador Norman Armour delivered three confidential memoranda on Nazi activities to the Castillo Government," which led to the dismissal of the German naval attaché for espionage.

NORMAN ARMOUR

Public sentiment seemed to be on the side of the United Nations, and on the first anniversary of Pearl Harbor, which was widely observed in Latin America, a mass meeting of "Homage to Roosevelt" was held in Buenos Aires. When Chile broke off relations with the Axis in January 1943, all the Argentine newspapers except German propaganda sheets greeted the news with "obvious pleasure and satisfaction." On June 4, 1943 the Castillo Government fell after a palace revolution, led by Generals Arturo Rawson and Pedro Pablo Ramírez, who became President. On Armour's recommendation, the new Cabinet was soon recognized by the United States, and also by twenty-one other nations. But the Ramírez Government proved a disappointment to the democracies, and in October Armour conveyed to it President Roosevelt's disapproval of the ban on Yiddish newspapers, which was soon lifted. In December 1943 a State Department document charged that Colonel Juan Perón '44, the power behind the Presidency, conspired in the pro-Nazi overthrow of the Bolivian Government. (He had already declared him-

ARMOUR, NORMAN—*Continued*

self as working to make Argentina a fascist state, although he did not use that term officially.)

According to *PM*'s Ray Josephs, Armour "was ahead of the State Department in wanting to crack down on the Argentine Government, but never fought publicly for his beliefs, and remained on friendly terms—in accordance with diplomatic tradition—with all groups in Argentina." In January 1944 the republic broke off diplomatic relations with the Axis; but one month later Ramírez was forced out, to be replaced "temporarily" by a "President delegate," General Edelmiro Farrell. In March the Acting Secretary of State of the United States, Edward R. Stettinius '40, stated that his nation could not resume relations with Argentina unless she proved by her actions that "groups not in sympathy with the declared Argentine policy of joining in the defense of the hemisphere" had not forced the change in the Government. The steps he suggested included interning Axis agents, cleaning up espionage, ending the smuggling of critical goods, and curtailing Axis communications. On March 28 Argentine Minister of the Interior, General Luis C. Perlinger, was reported to have denounced Ambassador Armour at a press conference, stating that all Argentinians should "look with an angry face at that gentleman"; previously, he had penalized American-owned companies on flimsy excuses. According to Pertinax (André Geraud '40), the General's remarks, thoroughly expurgated in a subsequent official version, were inspired by fear that his rival Perón was too friendly with Armour and the latter's close friend, Brazilian Ambassador Rodrigues Alves.

Armour himself was recalled to Washington in late June 1944, and on July 15 succeeded Lawrence Duggan as director of the State Department's reorganized Office of Latin-American Affairs, which left the United States without ambassadorial representation in Argentina. (On July 26 the Department published a summary of the situation, described as "one of the strongest documents, reflective of an irrevocable policy, that has emanated from the State Department in the eleven years Cordell Hull '40 has served as Secretary of State.") In his new State Department post the former Ambassador worked on implementing the security organization tentatively outlined at Dumbarton Oaks. Then, in December, he was appointed Ambassador to another trouble spot—Spain, succeeding the historian Carlton J. H. Hayes '42, who was criticized as an "appeaser." Most commentators called the appointment "a step in the right direction."

Armour presented his credentials to Generalissimo Franco on March 24, 1945. Possibly the most significant event during Armour's nine-month ambassadorship in Madrid was the publication in September of a letter the late President Roosevelt had sent to him at the time of his appointment, a letter which stated that a Franco Spain could not look for economic aid or friendship from the United States. The letter was made public by Under-Secretary of State Dean Acheson '41, but Franco censorship barred its publication in the Spanish press. Its printing in the United States Embassy's weekly bulletin, however, brought it to the notice of thousands of Spanish Government officials and leading citizens. Armour left Spain early in December after he requested to be relieved of the Madrid post. Upon his return to the United States he stated that Franco's changes in the direction of democratic government were not yet satisfactory to the United States. He said, too, that he had not seen signs in Spain of any organized opposition to Franco.

The former ambassador to Spain, who was fifty-seven at the time of his appointment, is tall and lean, and has wavy black hair. *Time* describes him as astute, aristocratic, popular, a top-flight diplomat; he is also described as having a straightforward manner and a magnetic personality. His church is the Episcopal, and his clubs are the University, Union, Princeton, Racquet and Tennis, and Brook in New York, and the Metropolitan in Washington. Norman Armour was, reputedly, the model for Ambassador Arnold Travis Spaulding in John Gunther's '41 *The Troubled Midnight* (1945)—a man depicted as happy and well-adjusted, somewhat old-fashioned, perhaps overly tolerand and disinterested, and leisurely; but incorruptible, selfless, Lincolnian. Gunther emphasizes his dignity, "his projection of a courteous good will no one could take advantage of. If he had been dressed in a pirate's costume, you would have known he was the American Ambassador. He gave an intense aroma of the best of the United States. He made you proud you were an American."

ARNALL, ELLIS (GIBBS) Mar. 20, 1907-
Governor of Georgia

Address: b. State Capitol, Atlanta, Ga.

America's youngest state governor at the time he took office in 1943, Ellis Arnall of Georgia has set a liberal legislative record. The Democrat is an important figure in Southern political leadership and has been hailed for the reform program he has carried out in Eugene Talmadge's '41 old stronghold. Writing a new page in Southern history, Arnall led the fight which abolished the poll tax in his state. Again the Governor made national headlines when Georgia became the first state to lower the voting age to eighteen. Representative of the liberal movement in the South, his measures considered significant of "political things to come," Arnall looks forward to industrial expansion in Georgia and in the South generally.

A native of the state he now governs, Ellis Gibbs Arnall was born in the town of Newnan on March 20, 1907, into a wealthy family of mill owners and merchants. The son of Joe Gibbs and Bessie Lena (Ellis) Arnall, at the age of twelve the young man announced his intention of becoming governor. This early attraction to politics was probably the result of two factors: his grandfather was a member of the Alabama Legislature, and for a period young Arnall worked as a page in the Alabama House. He displayed his talents for leadership at school, where during four years at high school he was the leader of his class. At college, too, Arnall engaged widely in campus activities, first at Mercer University at Macon, Georgia (1924), and then at the University of the South at Sewanee, Tennessee. There he majored in Greek (which later proved of value in winning the Greek vote) and received his B.A. degree in 1928. Then, taking his legal training at the University of Georgia, he won high academic honors and was "top man" in extracurricular affairs: he served as president of his class, his legal fraternity, the interfraternity council, the general student body, and the campus Gridiron Club.

After receiving his LL.B. degree in 1931, Arnall won admission to the Georgia bar and began his legal practice. As a "county-seat lawyer" in his home town, he studied the political scene, and in 1933 entered the political arena as a candidate for the Georgia House of Representatives. Running against five opponents, the twenty-six-year-old attorney polled 2,546 votes to their combined 232 votes. Immediately after the election, as representative of Coweta County, he ran for speaker pro tem before he had taken his seat in the House. "They threw me the gavel," he comments. He served in the legislature until 1937, during which time he was prominent in civic affairs, winning the Distinguished Service Award of the Georgia Junior Chamber of Commerce as the outstanding young citizen of the community in 1934. In 1937 Arnall was appointed assistant State attorney general; in 1939 he entered the race for attorney general and was elected. As the youngest attorney general in the country, Arnall continued to grow in political stature. He became famous for his prosecution of certain asphalt contractors and for collecting damages for the State. Often he would hitchhike the forty miles from his home in Newnan to his office in the Capitol; it is said that motorists would compete to give him a lift. According to one columnist, he early adopted "the habit of dropping folks notes for one reason or another, a custom found useful by Jim Farley '41."

A firsthand knowledge of the Talmadge Administration reinforced Arnall's criticism of the Governor's power. Since the growing opposition to the regime of Eugene Talmadge needed a crusading leader, Arnall came to the front, organizing a blistering drive against Talmadge. "This State has been given a national black eye," he declared. "Georgia wants reformation and wants it quickly. I'm going to shake hands with every voter in the State and speak from every stump. I'm out to destroy forever the Hitler pattern." Shortly after announcing his candidacy for the Democratic nomination for Governor in early 1942, he conferred with President Roosevelt '42. In the gubernatorial election that followed he was backed by the President and liberals in and out of the State. The campaign raged for months, made bitter by the racial issue, which Talmadge emphasized. Campaigning vigorously "to restore decency and democracy in Georgia," Arnall exposed his opponent's demagogic use of this issue. While Talmadge ran on a program of "'white supremacy,' States' rights, and old-time religion," the young New Dealer pledged a broad program of reform, declaring, "Georgia now presents the worst type of dictatorship. . . .I now hope to be able to do something about it." When the votes were counted in the Democratic 'white primary' in September, Arnall had won a definite victory, with 162,889 votes to Talmadge's 117,731. (A primary victory is tantamount to election in the South.)

ELLIS ARNALL

"The boy wonder of Georgia politics" was inaugurated in January 1943, at a ceremony attended by scores of proud relatives, a fact which aroused suspicion of continuing patronage in the minds of some Talmadge-weary persons. But suspicions were soon dispelled: Within twenty-four days after Arnall had taken office the legislature had unanimously adopted every campaign promise he had made. It required ten bills to accomplish his Georgian "revolution," in which he succeeded in removing every dictatorial statute of the Talmadge period without dissent in the legislature. Under his influence education was removed from the realm of politics and the State's institutions of higher learning were restored to their accredited standing. (Georgia's colleges had been suspended by the Southern Association of Colleges and Secondary Schools because of Talmadge's tactics in the schools.)

Further legislation drastically reduced the powers which Talmadge had acquired and brought the governor's authority within constitutional bounds. The pardon and clemency rackets were exposed, and the new governor set out to clean up Georgia's notorious prisons and to modernize its penal system. After shocking incidents in the State's work camps had been revealed, Arnall ordered public hearings and then called a special legislative session to take action. A comprehensive prison reform law abolished the Board of Prisons and set up a Department of Corrections. In an effort to get business back to Georgia, Arnall relaxed laws regulating corporations and pointed out the resources the State offers to manufacturers. Thus by encouraging capital, he hoped to see an industrial revival. Early in his administration the Governor enlisted the Nation's best legal and administrative minds to assist in the formulation of a new constitution for the State. In August 1945 Georgia's citizens adopted the new constitution at the polls by an almost 3-to-1 vote, thus replacing the 1877 model with a "streamlined" charter. Left with a large State debt by his predecessor, Arnall worked to get Georgia "out of the red" and in the first two years reduced it.

In August 1943 Georgia became the first state to lower the voting age to eighteen. Georgians heeded the "fight at eighteen, vote at eighteen" slogan by ratifying the constitutional amendment by a popular vote of more than two to one. Georgia's youth had shown its strength in the fight against Talmadge, and Arnall returned their support by leading the way toward the lowered voting age. Proud of this accomplishment, the Governor, only twice eighteen himself, expressed the hope that other states and the Federal Government would follow Georgia's example. In an article in *Scholastic Debater* (March 1945) entitled "Admitting Youth to Citizenship," he explains his views on this issue. Accepting the validity of the argument favoring the vote for those who are "old enough to fight and die for their country," Arnall further believes that the idealism of youth is needed in public affairs and that young people should be given the opportunity to exercise their citizenship at the earliest possible time. His testimony on this issue before a subcommittee of the Committee on the Judiciary of the United States House of Representatives appears in the *Congressional Digest* for August-September 1944. Characterizing himself as a believer in dynamic government, one that changes with changing times, Georgia's chief executive declared: "No one can convince me that a young man or young woman of eighteen today does not have a power of understanding that transcends that of a twenty-one-year-old man or woman of a generation ago."

In January 1944 Georgia was first again in passing progressive voting legislation—the first state to pass a soldier-vote measure. In response to Arnall's plea, a bill was enacted to ease requirements and eliminate obstacles to voting by Georgia's citizens in service. The following year, in February, Arnall and Georgia were once more in the national spotlight on a franchise issue. At a joint legislative session the Governor declared that the poll tax must go, that if it were not eliminated by legislation he would do so by executive order. "I am tired of seeing Georgia kicked about in Washington and hearing our people called barbarians who hate democracy and prevent the citizens from voting," said Arnall. The previously reluctant legislature repealed the poll tax, winning for Georgia and Arnall applause throughout the country. *Time* Magazine commented that Georgia "would never have thrown off this feudal custom had it not been for its young and energetic governor," while Clark Foreman in the *New Republic* stated that Arnall "has done more to extend the franchise than any other American since women were given the vote." The Governor received the editorial congratulations of many publications, including the New York *Herald Tribune,* whose article, noting with satisfaction that "when one Southern state discards a legalized pattern of prejudice, the pattern is weakened elsewhere," urged similar action in the seven remaining poll-tax states.

Despite these advances, it has been pointed out that Georgia does not yet have universal suffrage. The real elections are still seen as Democratic primaries, which remain "lily-white" by party decree. While a decision of the United States Supreme Court in April 1944 nullified the "white primary" in Texas, a decision which was held to apply in other states, Democratic party leaders in Georgia announced their intention of resisting the decision in every way possible. Arnall, too, disavowed the high court's ruling giving the Negro the right to participate in the primaries, when he labeled the decision "a blow to liberalism." On the Negro question, Arnall upholds the traditional Southern system of segregation as "conducive to the welfare of both the white and colored races." "We of the South do not believe in social equality with the Negro," he says. In Arnall's opinion, "the important thing for the Negro is not social equality but economic equality, the right to work and earn a decent living so that he will have enough to eat, a good home, and a good education." However, he has opposed the Government's attempt to guarantee such economic equality through the Fair Employment Practice Committee, rejecting FEPC as "unworkable" and as "an irritant to harmonious race relations." With a practical eye to the future, Arnall has said, "We want the Negro to get better wages, to have better homes, to improve his standard of living. It is foolish for anyone to think otherwise. The more prosperous the Negro is, the better off all of us are."

Associated with the late President Roosevelt and often termed a New Dealer, Arnall has voluntarily become involved in several national liberal issues. Late in 1944 he came out in opposition to the State Department appointments, and early the following year he was a firm supporter of Henry A. Wallace '40 in the debate that followed the latter's nomination as Secretary of Commerce. The Governor telegraphed the State's senior Senator, Walter F. George '43, urging him to drop his opposition to Wallace. As head of Georgia's delegation to the Democratic National Convention in June 1944, Arnall had kept his entire group solidly behind Wallace's nomination for the Vice-Presidency. Previously he had opposed a split within the Democratic Party when there was talk of a Southern "revolt" against the New Deal. Unlike many of his colleagues below the Mason-Dixon line, Arnall calls himself a "Federalist" who does not subscribe to "the moth-eaten doctrine of States' rights." Speaking at the Denver Conference of Western and Southern Governors in 1943, the Georgian emphasized that there has been "too much prattle about States' rights and not enough about States' responsibilities."

The Southern leader looks forward to a new era of revitalization for Georgia and the entire South as he predicts wide industrial expansion for that region. Discussing this theme at a meeting of the New York Southern Society in December 1943, he cited decentralization of industry and the removal of artificial restrictions on industry as signs of progress in this direction. For Georgia, Arnall seeks to keep "native talent" at home, to develop the State's rich resources and attract business. Writing in *Collier's* (July 28, 1945), the Governor declared, "The South has lived too much in the past." Afflicted by economic and political evils the South has stagnated, he continued; "but the new South is waking up and is going to work in a world of reality."

Arnall directed an attack on the railroads to break down freight rates "discriminatory" to the South. Charging conspiracy on the part of the railroads in their higher rates for the South, Arnall by-passed the ICC and went to the Supreme Court for action. The high court ruled to accept jurisdiction in the freight-rate controversy, and the Governor prepared to argue the State's (and thereby the South's) case against the railroads before that tribunal. An exponent of free trade, Arnall discussed "the freight-rate cartel" in an article in the *New Republic* (April 1945) in which he held the unequal freight rates were an obstacle to industrial development in the South and West. The ruling of the ICC the following month, which abolished higher rates for the South and West, was called a clear-cut victory for Arnall. In his New York *Times* article of July 15, 1945, the Governor hailed this decision, "which will make it possible for Southern industry to compete on the domestic market." This discussion of Southern economy names poverty the chief plague of that region and visualizes in the economic development of "Our Last Frontier" the hope of postwar America.

It was considered a rare tribute in the South when the Negro newspaper, the Atlanta *Daily World*, praised Georgia's governor in an editorial entitled "The People Want Arnall." A draft-Arnall movement in the State was defeated in 1945 when the legislature declined to remove the constitutional bar against self-succession. However, the Governor has been mentioned for various Federal posts and it is believed likely that President Truman '45 will offer him an office when Arnall's term expires in 1947. With his political finesse and bold, incisive speech, Arnall, according to one writer, "shows more signs of becoming another Hugo Black '41 or another Claude Pepper '41 than any other young progressive in the South today." To this Lowell Mellett of the New York *Post* adds: "Some think he dreams of smashing a more stubborn precedent than any he has tackled thus far—the precedent of the past eighty years against electing anyone from the South to our highest elective office." John Chamberlain '40 in an appraisal of Arnall in *Life* (August 6, 1945) declared: "But Arnall's concern for the common man is more of the head than of the heart and he is a little contemptuous of people like Pepper and Wallace who 'get themselves tagged.'" Chamberlain considers Arnall as differing from the true New Dealer in his "dislike of centralized Federal power and in his concern for balanced budgets, sinking funds, and 'pay-as-you-go' finance."

Arnall is a stocky figure, five feet six inches in height, weighing one hundred and ninety pounds. He has light, thinning hair, and dark brown eyes, and is given to wearing tweedy clothes. The Governor has been described as "a sort of class-reunion type—the fellow who was voted 'most likely to succeed' and then crossed them up by doing it." He is an avid reader of biography, fiction, and detective stories, preferring books with historical background. His sense of humor was evident when he appeared as guest on the *Information Please* program. A member of the American and Georgia State Bar Associations, he belongs to three fraternities, Phi Delta Phi, Kappa Alpha, and Phi Kappa Phi, and he is a Mason and a Woodman. Georgia's First Lady is the former Mildred Delaney Slemons of Orlando, Florida, to whom Arnall was married on April 6, 1935; they have two children: a son, Alvan Slemons, and a daughter, Mildred Delaney. Their official residence is the Executive Mansion in Atlanta, their home address Arnall's birthplace, about thirty-five miles from the capital. Georgia's governor has been characterized as "a genuine idealist-realist," and Thomas L. Stokes has said, "The young gentleman from Georgia is worth watching."

ARNE, SIGRID (ärn sē'grĭd) Journalist
Address: b. c/o Associated Press, Starr Bldg., Washington, D.C.; h. 1623 Mt. Eagle Pl., Alexandria, Va.

Considered one of the best Associated Press reporters in the international field, Sigrid Arne is the author of *The United Nations Primer*, published in September 1945. It is an attempt, according to her publishers, to make the world conferences from the Atlantic Charter meeting to the San Francisco conference clear to the average layman, without the use of propaganda. Miss Arne's reportorial assignments have varied widely: she has been sent to cover race riots and asked to pour tea at the home of a Supreme Court Justice.

Although she was born in New York City, Sigrid Arne (who adopted "Arne" as a pen name) spent only a short time in her mid-Manhattan home near Central Park. She is the daughter of Magnus Holmquist, a successful overcoat manufacturer, and Hulda (Larson) Holmquist. When she was four years old her father took the family to his native Sweden for a visit. Upon their return to the States, they decided to establish themselves in Cleveland. In that city Sigrid attended the Willard Grammar School and West High School. She received her B.A. from the University of Michigan in 1922 and began her career as a newspaper reporter four years later. Her talent for writing was evident from her earliest school days. Her first newspaper job was as a reporter on the Muskogee (Oklahoma) *Daily Phoenix*, for which she worked in 1926. She left the paper in the fall of that year, and for the next seven years, until she became a feature writer for the Associated Press in October

SIGRID ARNE

1933, she worked on the Oklahoma City *Times,* Detroit *News, Plain Talk* (a magazine), and the Cleveland *News.*

While gathering her newspaper experience, Miss Arne gained a reputation as a crusader for causes which she considered worth fighting for. In 1929, about ten years before the appearance of John Steinbeck's '40 best-selling novel, *The Grapes of Wrath,* Miss Arne wrote a series of fourteen articles on the plight of the "Okies," the migrant workers from Oklahoma. Her approach differed from that of Steinbeck's in that she actually reported facts and named names, reaching a limited newspaper audience, while Steinbeck, who based his novel on facts, made the entire nation suddenly conscious of the existence of the migratory worker. A few years later she discovered a flourishing black market in infants and bought a twenty-four-hour-old baby in order to expose the racket. She has also investigated and reported a great many facts about the Ku Klux Klan; and she succeeded in getting an aged convicted murderer's sentence commuted to life imprisonment because she was certain that extenuating circumstances warranted it.

In 1933, the year that followed the inception of the New Deal, Sigrid Arne joined the Washington Bureau of the Associated Press. In the years that followed it became one of Miss Arne's greatest responsibilities to analyze and interpret the intricacies of the New Deal. One of her most important assignments in Washington was the analysis of the Social Security Act. Her study brought to light many problems involved in the law. She constructed a chart and, using it for reference, presented her questions to many of the officials of the new bureau. After studying her chart, they, being unable to satisfactorily answer the questions, offered her the job of solving some of the problems she had discovered. Preferring her newspaper career, she refused the offer.

In 1941 Miss Arne went to Hollywood on her first assignment as a roving reporter for the A.P. She was not very fond of Hollywood, mainly because, with the world at war, she felt it an inappropriate place for herself, as a reporter, to be. During the three months she stayed there, nevertheless, she did turn up some good stories. For the next two years she wandered about the country, picking up stories about the war industries for the Associated Press. She also wrote two articles on different aspects of aviation, which were published in the magazine *Flying.* For this assignment she traveled up the Alaskan highway in a jeep. She wrote the first story on civilian defense, and made such difficult subjects as the Bretton Woods conference and UNRRA understandable to the average reader. Toward the end of the war Miss Arne pointed out that Germany was, even then, preparing for another war to come. She also broke a story disclosing secret German plans to accumulate a huge supply of raw materials to meet the needs of a new three-year war.

Miss Arne's postwar copy has been concerned almost entirely with production and trade problems. In spite of her supposed dislike for mathematics and inability to file her own income tax reports, she is interested in national and international economy. In Miss Arne's opinion, the great national debt will not have disastrous effects on the United States if production and, hence, taxes are kept at a high level until it is liquidated. She has stressed the need for full employment and discussed the employers' problems of reconverting their factories and of freeing cash for peacetime work. One of the interests closest to her heart is the growth of the United Nations organization. In her book, *The United Nations Primer,* she explains and interprets the complicated agreements reached at all the major United Nations conferences beginning with the meeting that produced the Atlantic Charter. She has covered United Nations conferences since they began, and told how she wore out a pair of brown suede oxfords in the marble lobby of the Veterans Building in San Francisco, getting from the various foreign ministers the story of the World Charter as it went together, piece by piece. While the New York *Times* reviewer called the volume "a miracle of crisp, compact report and analysis," it was added that "the need for condensation sometimes leads to the omission of vital material, which twists the pattern."

Sigrid Arne is described as a tall blonde, more handsome than pretty, who would make a perfect Isolde in Wagner's opera—at least pictorially. Observers say that she attacks a typewriter as though she has a personal grudge against its inventor, "spilling out stories like a crack stenographer bent on winning a time prize." Sailing is one of her recreations, and she likes to visit art museums. For ten years she wrote a serial fairy story for the A.P. that was published during the month of December. From friends in Shanghai, back in the thirties, she learned that these tales were very popular with young Chinese readers of the Shanghai *Times.*

ARTHUR, JEAN Oct. 17, 1908- Actress
Address: b. c/o Columbia Pictures Corp., Columbia Sq., Hollywood, Calif.

The least-known star in Hollywood off the screen, Jean Arthur has "more smash successes to her credit than any other movie person." She has been a top box-office attraction for ten years, having survived every movie epoch since the days of silent pictures. She has attained a stellar position on the screen on her own terms, refusing to play roles she dislikes, and she has studiously avoided the usual "intimate" Hollywood publicity.

A New Yorker, the actress was born Gladys Greene in the city's Washington Heights section, on October 17, 1908. She was a tomboy, liked to climb trees and fences, and her first ambition was to be a dancer. The young girl attended a New York City high school; then, after deciding against a teaching career, she became a model for Howard Chandler Christy. This work led her into the theater, where she appeared briefly. She started her film career in 1924, acting in two-reel comedies and westerns. In 1928 she played her first leading role, a part opposite Richard Dix in a Paramount baseball picture called *Warming Up*. The next year she appeared in two more Paramount films, *The Canary Murder Case* and *The Mysterious Dr. Fu Manchu.* For two or three years Miss Arthur acted in more than a dozen pictures, most of them for Paramount: *The Greene Murder Case* (1929), *Half Way to Heaven* (1929), *The Saturday Night Kid* (1929), *The Return of Dr. Fu Manchu* (1930), *Sins of the Fathers* (1930), *The Street of Chance* (1930).

But she was dissatisfied with her roles, and in 1932 the actress left Hollywood to return to the stage. In the next few years she played leading parts in several short-run productions: *Foreign Affairs* (1932) with Dorothy Gish '44; *The Man Who Reclaimed His Head* (1932) opposite Claude Rains; *Twenty-five Dollars an Hour* (1933) opposite Georges Metaxa; her favorite, "a pleasant little comedy," *The Curtain Rises* (1933); and *The Bride of Torozko* (1934).

At the end of this period Miss Arthur accepted a contract with Columbia Pictures and resumed her film career. Eight or ten more pictures followed, including *Whirlpool* (1934), *The Whole Town's Talking* (1935), *Public Hero Number One* (MGM, 1935), and *Mr. Deeds Goes to Town* (1936), a successful comedy hit in which she was co-starred with Gary Cooper '41. During 1936 she also appeared in *Adventure in Manhattan, More Than a Secretary,* and *The Plainsman* for Paramount. The following year the talented comedienne was starred in *History Is Made at Night* (United Artists), and *Easy Living* (Paramount). Then in 1938 she played a leading role in the celluloid adaptation of the successful Kaufman '41-Hart '40 play *You Can't Take It With You.* The next year Miss Arthur appeared in *Only Angels Have Wings, Mr. Smith Goes to Washington,* and *Too Many Husbands.*

When Columbia Pictures filmed *Arizona* in 1940 Jean Arthur was given the leading feminine role in this rip-roaring western. The picture was released in Tucson, Arizona, as part of a tumultuous "revival" celebration of Pioneer Week. Miss Arthur was present with other members of the film's cast and studio officials for the much-publicized première. Jerry Mason in *This Week* reveals that Miss Arthur likes to tell a story about this event, a story of a dinner given in her honor by the Mayor. "The *pièce de resistance* was to be the presentation to Jean of a beautiful hand-hammered copper plate. Dinner over, the Mayor rose, began his speech: 'It is indeed a pleasure to have here tonight the Sweetheart of Arizona. . . .We who had the honor to know her so very well came to love her. . . .So, on behalf of all her most intimate friends in Arizona, I'd like to present this plate to—Miss Gene Autry!' "

JEAN ARTHUR

Miss Arthur's next film, *The Devil and Miss Jones* (1941), of which her husband Frank J. Ross, Jr., was co-producer, was hailed as a unique production. The story was a saucy comedy-drama of life in New York's "subway society," and Miss Arthur played a department store salesgirl. This success was followed by another fine comedy in 1942, *The Talk of the Town,* directed by George Stevens. *Time* Magazine commended Miss Arthur's "expert energy" in this hilarious comedy, and Bosley Crowther in his New York *Times* review said: "Miss Arthur is charming, as usual, in her bewilderment."

With her delightful portrayal of the harassed Washingtonian in *The More the Merrier* in 1943, Miss Arthur, again directed by George Stevens, added to her collection of fine performances. The New York *World-Telegram* applauded the film and found the charm of the picture in its "joyous nonsense," while another critic admiringly remarked that "Miss Arthur plays with spirit and charm." She next appeared in *A Lady Takes a Chance* (1943) opposite John Wayne, a part which *Variety* called one of her best roles. Miss Arthur, a native New Yorker herself, played the part of a New York bank clerk in this film. While making the picture, director William Seiter reports, Miss Arthur found herself becoming homesick

ARTHUR, JEAN—*Continued*

for her native city. (She delights in the cold weather of the Eastern winter and often spends vacations in New York.)

The Impatient Years, Miss Arthur's 1944 film, was a gay, amusing love story. She played the part of a young soldier's wife, a performance *Variety* described as "capital." The actress has entertained at Army camps and visited hospitals, but she dislikes receiving publicity for her war service activities. There have been rumors of Miss Arthur's decision to retire from the screen; but the Hollywood *Reporter* in September 1944 suggested that the star might change her mind since she can play the choice role in the adaptation of John van Druten's '43 *The Voice of the Turtle* if she so desires. Then, in October the same paper revealed that for the first time Jean Arthur, at her own request, was not represented in the new edition of the *Players' Directory* (the Who's Who of the screen). In the 1945-46 Broadway season, Miss Arthur was one of several screen actresses to return to the stage. She was signed for the starring role of *Born Yesterday,* scheduled for out-of-town tryout in late December.

Miss Arthur studies her scripts carefully, and when she arrives on the set to work on a picture she knows her lines. She considers herself best in comedy roles and has made a success as a romantic comedienne. In 1944 she was nominated for an "Oscar" by the Academy of Motion Picture Arts and Sciences for her work in *The More the Merrier.* She has a distinctive, wistful voice, described by one writer as "clear, low, and sort of lilting." She is careful about her choice of roles, and when a part displeases her she refuses to accept it. Such actions by the star have resulted in her suspension by her studio on three occasions.

Her ideas about her motion picture work are definite. She explains: "You just go ahead and play each part as well as you can, and if movie audiences like you they'll keep on coming." Maintaining that publicity is not necessary to a successful career, the actress has stated: "If people don't like your work, all the still pictures in the world can't help you and nothing written about you, even oceans of it, will make you popular." Her aversion to publicity and her refusal to grant many interviews led the Hollywood Women's Press Club in 1942 to vote her one of the least cooperative actresses. But Miss Arthur has endeavored to explain her attitude: "I find it difficult to give interviews and let myself go to a person whom I have met for the first time. It is also difficult for that person to interpret correctly what I say on a first meeting." Hence there has been little authentic material published about this leading lady, for she prefers to live her personal life quietly. She pointedly states: "When I have something to say, I'll say it, but when I haven't, then I won't talk for publication."

The actress is married to Frank J. Ross, Jr., formerly a New York real estate broker. Since he is now a Hollywood producer, the couple's permanent home is in California, where Miss Arthur indulges in one of her hobbies—the collecting of fine china. Her other interests are books and symphonic music. A slim five feet four inches, she has gray-green eyes, and her brown hair is lightened for photographing. Unlike the comedienne's roles she plays so convincingly, Miss Arthur is known for her shyness—she is "a good talker, but a better listener."

ARTZYBASHEFF, BORIS (ärt-sĭ-bä'shĕf)
May 25, 1899- Artist; author
Address: h. 524 E. 89th St., New York City

"I hate art for art's sake!" says Boris Artzybasheff, whose drawings have won almost unanimous critical praise; but he hates almost equally being pigeonholed as an illustrator, although he has decorated half a hundred books, has painted many covers for popular magazines, illustrated many advertisements, and is one of the four leading designers of book jackets. The explanation is that he looks on himself as a designer, "as every true artist is," whose field is "any object which is beautiful and useful," and resents having either the beauty or the meaning stressed at the expense of the other. As such, Artzybasheff has designed women's clothes, stage sets, portraits, murals, delicate and "startlingly lovely" initials, striking grotesques, a night club, and a cathedral altar. And he has made several distinct reputations—as an illustrator, editor, and author, particularly of children's books; as the creator of extremely useful charts and graphs; and as the painter of clever personifications of machines and other inanimate objects.

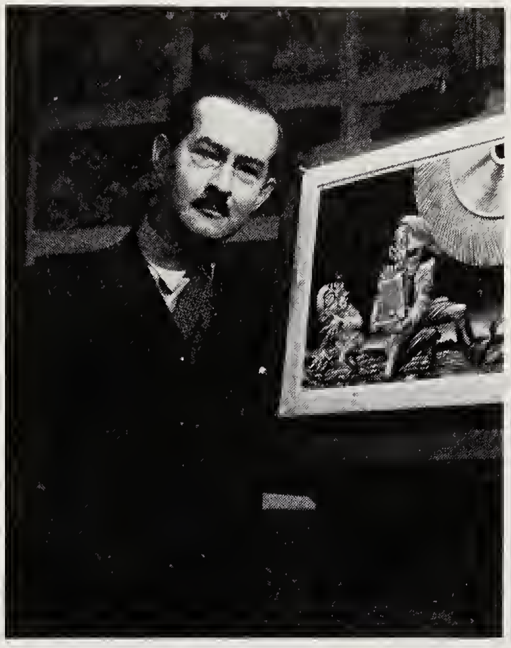
American by adoption, Boris Artzybasheff was born in Kharkov, Ukraine, Russia, on May 25, 1899, the centennial of the birth of Pushkin. His birth was not registered until June 5, however, and this is therefore given as his date of birth on his official papers and in certain reference works. He is a collateral descendant of Kosciusko through his father, Mikhail Petrovich Artsybashev (the name is transliterated in a number of ways), who began his career as a painter but became world-famous as the author of daring books and plays. Boris' parents separated when he was one year old, and the boy remained with his mother, Anna Vassilievna (Koboushko) Artsybasheva, in St. Petersburg; he saw his father twice a year, when passing through Moscow on his way to vacations in South Russia.

When he was eight Artzybasheff's mother entered him in Prince Tenishev's school, which he describes as "an extremely liberal and progressive school for the sons of the rich and powerful." "I wanted to be an artist ever since I stopped wanting to be a fireman," he says, and his work in art class was so far above average that the teachers did not even try to grade it. When Boris had been there for three years, his self-made father refused to continue paying the high tuition fees, but the school officials were so impressed by the boy's talent that they allowed him to continue on a scholarship. In 1917-18, after the outbreak of revolution, "the city starved and he starved with it," fainting on the street from hunger twice, although he was a fairly husky young man. Graduated in the winter of 1918-19, he had completed the equivalent of the first year of college; and he then enrolled in the University of Kiev's law school—not because he had any idea of becoming a lawyer, but because that was considered to offer the best-rounded education in Russia.

But Artzybasheff was drafted immediately into a German-sponsored Ukrainian army which was trying to carve an independent republic out of Russian territory—a movement with which he had no sympathy. He and the other upper-class youths were put in a machine-gun battalion, stationed behind their own lines to fire on retreating men. "Of course we didn't," the artist recalls. "We ran first." After this army's defeat five months later Artzybasheff made his way through the lines of the embattled Red and White armies on another man's passport; once he was captured and would have been shot, but managed to escape in the confusion. When he reached the Black Sea he signed on a vessel bound for Ceylon, hoping to get from there to Vladivostok—but the ship's destination turned out to be the United States.

The tall young sailor arrived in New York harbor with no knowledge of English, no friends or relatives in America, and his total assets consisted of a few cents' worth of Turkish money and the clothes he was wearing—Russian Army blouse, Russian Navy trousers, and boots which had split open. The immigration authorities detained him on Ellis Island for twenty-nine days, during which a visiting Russian priest gave him a suit at least twice too big, and a girl employee to whom he never spoke and whose name he never learned presented him with the shoes he needed so badly. After appealing to the Russian ambassador, Artzybasheff was released. The official who had committed him to Ellis Island had taken a fancy to him, and found him a job with an engraving firm. When it came to writing his name in the Latin alphabet, the Russian was persuaded by someone to spell it in its present form, Artzybasheff. He now thinks the name should properly be transliterated as Artsibashev, and regrets that he labeled himself as he did: "The *zy* frightens people."

After Artzybasheff had spent some time doing lettering, ornamental borders, and other hack work for fifteen dollars a week, the head artist failed to show up one day and Artzybasheff was given his assignment—a picture of three beer bottles. The firm was so pleased with the results that from then on they gave him all the bottles to draw. After he had been there three months the New York *World* accepted some of his caricatures, and the artist was emboldened to ask for a three-dollar raise in salary, and to leave when it was refused. The *World* published his drawings as "The Distinguished Russian Artist, Boris Arzybasheff . . . Impressionizing," and when the engraver saw it he asked Artzybasheff to return to his job, but he again refused. Rated an able-bodied seaman, the youth shipped on a Standard Oil tanker for South America. He made extra money by standing watch for his drunken shipmates at time-and-a-half, and returned to New York after five months with about a hundred dollars. "As I had enlarged my English vocabulary by association with the sailors, most of whom were Swedes and Spaniards, the rest was comparatively easy," Artzybasheff has written.



BORIS ARTZYBASHEFF

Actually, as he told an interviewer, the years in which he was establishing himself as an independent artist were "complete hell. I established myself in a horrible house where several other young artists were living who later became well-known, and I lived largely on rice and I pretty near starved to death." A walk-up apartment, decorated by him entirely in fifteenth century Russian style, was, however, the subject of an article in the October 1921 *House Beautiful*. He was repelled by what he saw of America's "business civilization"; but, lacking a passport as well as money, he was unable to go to Paris, where he would have preferred to live, or to Turkey to see his mother before her death in 1923. It was the George S. Kaufman '41-Marc Connelly satire, *Beggar on Horseback* (1924), which finally reconciled Artzybasheff to life in the United States. "I was poor and hungry," he says, "but I saw it three times. It made me realize for the first time that there were Americans who saw the same things I did and made fun of them."

At about this time the artist happened to meet Jo Davidson's '45 sister, who commissioned him to do egg tempera murals for her Russian restaurant and supplied him with crates of eggs for the purpose. Only a few would have been needed, and Artzybasheff actually did the murals in an easier medium, anyway, but he found the eggs a welcome addition to his rice diet. Guy Pène Du Bois saw the murals and wrote an article about them for *International Studio*, illustrated with reproductions, which caused the president of E. P. Dutton to commission the artist to illustrate *Verotchka's Tales* (1922). After that Artzybasheff was considered as an illustrator of children's books. He had already illustrated an adult book, Ed-

ARTZYBASHEFF, BORIS—*Continued*

mund Wilson's '45 morbid *The Undertaker's Garland* (1922), although he was unable to read English. About 1922 Artzybasheff decorated a night club, the Russian Eagle, designed stage sets for Michel Fokine's ballets and others, but gave up stage designing when he had difficulty collecting payments for work done. He also designed dresses—"very cheap ones for two very cheap dress houses"—and even "twisted" himself to do realistic pictures for advertising agencies. The artist has continued to do commercial work, signed and unsigned, throughout his career.

In 1926 Artzybasheff, then twenty-seven, became a citizen of the United States, and with his precious new passport was enabled to spend much of that and succeeding years in Paris. These were not pleasure trips, however. Bruce Lockwood writes that "while abroad, the traveler toiled over book illustrations until hallucinations beset him." While in Paris he designed an altar for a Roman Catholic cathedral which was approved in toto by a consulting engineer; however, the prospective donor died before the altar could be built. The Russian-American held two one-man shows in Paris from 1926 to 1930; from 1923 through 1931 he also had six New York exhibitions. An interviewer who had been unable to find one unfavorable review of his pictures once asked Artzybasheff if he had ever received any. The only bad notice the artist could recall was from Westbrook Pegler '40 in 1932. "All the early praise made me feel I hadn't arrived," said Artzybasheff. "When they start pulling you down you know you have gotten there."

Artzybasheff's illustrations have received almost unqualified praise. He has designed some two dozen books, choosing their typography, size, binding, and decorations, and has illustrated as many more, among them three books by Padraic Colum, two by Dhan Gopal Mukerji, and others by Rabindranath Tagore, Margery Williams Bianco, Ella Young, William Allingham, and one by Balzac, *Droll Stories*. Boris Artzybasheff has edited and illustrated some old favorites, *The Arabian Nights Entertainments* and *Aesop's Fables*, and has written two well-received books. *Poor Shaydullah* (1931) is an original fable, and *Seven Simeons* (1937) is a retelling of a Russian fairy tale which won the *Herald Tribune* Spring Book Festival Prize for the best book for younger children. It was Artzybasheff's illustrations for Henriette Célarie's *Behind Moroccan Walls* to which Pegler objected, asserting that Artzybasheff had maligned the Arab race. The artist had, as it happened, done research for the pictures in North Africa.

For Padraic Colum's book of poems called *Creatures*, and for Mukerji's *Ghond the Hunter* and Jacques Dorey's *Three and the Moon*, during 1927-29, Artzybasheff employed an extremely rhythmical and decorative style of bold curves, black on white and white on black, which is said to have started a wave of imitations. A bookseller told Artzybasheff that the books were selling at a great rate to designers, especially of textiles, and Macy's department store admitted that they had used his pictures on their Christmas wrapping paper. The artist's friends could not understand why he took no action about this violation of copyright. The style he employed in *The Circus of Dr. Lao* was termed surrealism by Clifton Fadiman '41, to Artzybasheff's annoyance.

Artzybasheff maintains that his work has no connection with surrealism, that he was employing his unrealistic "burlesque or grotesque" style long before Salvador Dali '40 came upon the scene, and that while it is intended to give emotion as design, it always has idea content. Therefore, he particularly enjoyed the making of statistical charts, maps, and graphs for *Fortune*, beginning about 1934. While making pictorially attractive designs, he built up a reputation for making complex relationships clear. As a result, during the Second World War he was engaged by the Office of the Geographer as a consultant, supervising graphic presentation of facts for use by the Department of State, and production of an atlas which was used also by the Army Training Command. Another Luce '41 publication, the news weekly *Time*, also began to use Artzybasheff's work; and the November 3, 1941, issue of *Life* reproduced five of his gouaches—works which fantastically but effectively showed war machines as men or animals. "The measure of his ability to put his point across in paint," *Life* commented, "is that the more closely the paintings are examined, the more clever their details become." (They were reprinted in South America, Sweden, and Germany—in the latter case without credit; his seventy-odd gruesomely amusing versions of the swastika were also reprinted in other countries.) His personifications appealed particularly to servicemen, as did the series of *Axis in Agony* caricatures he made for Wickwire Spencer Steel Company advertising after the United States entered the war. Several units of the armed forces asked him to design insignia for them, including a submarine's own flag.

Meanwhile, however, Artzybasheff was becoming known in still another connection. The first of his cover portraits for *Time* appeared in June 1941. It was a realistic portrait of Marshal Timoshenko '40—against a background of the familiar profile of his friend and commander Joseph Stalin '42. Artzybasheff says he had to fight to get *Time* editors to accept the idea of "expressive backgrounds"; but they did, and subsequently had all their cover artists employ this device. "Even then," writes P. I. Prentice of *Time*, "'Artzy' is likely to surprise us. . . .Often as not he works into his painting some dramatic animal-like machine. . . .They are almost his trademark today." Artzybasheff does as many covers as he chooses—they take him about a week each, working from photographs and when possible from notes. Private purchasers are charged "what I think it is worth," he says. Among them are a Texas museum which bought his Texans, including General Eisenhower '42 and Admiral Nimitz '42, and the Massachusetts Institute of Technology, which bought an anthropomorphized but accurate portrait of a B-29 radar set.

The "gentle-eyed and gentle-voiced" artist is six feet tall, dark-haired and light-complexioned. He wears rimless pince-nez, speaks with a slight Russian accent, and supposes that he should really weigh one hundred and seventy pounds instead of one hundred and eighty. Artzybasheff's extremely neat and workmanlike studio is in his house near New York's

East River. A good description of his working methods can be found in the December 1941 issue of *American Artist*: in general, he uses any method and material he thinks will create the particular line or tone he is after, and has devised several craft methods, including the use of thin celluloid sheets in lieu of paper, which "give his work a technical perfection that is unique." He seldom if ever uses a model, but may first sculpture a difficult object and draw from that. One of his woodcuts was chosen by the Kansas City Woodcut Society in 1937 for distribution to its members. Artzybasheff himself is a member of the Institute of Graphic Arts and the Society of Illustrators. His church is the Russian Greek Orthodox.

Artzybasheff is married to Elisabeth Southard Snyder, of an old New England family, who was working as a Wall Street secretary at the time of their marriage. That anniversary should be easy to remember—the date was Washington's Birthday, 1930. Mrs. Artzybasheff is even more enthusiastic than her husband about their East Haddam (Connecticut) farm, where the artist spends his free time working about the place. He is also fond of boating and of fishing and hunting. He has a contract with a publisher to do three book jackets each year at an "unprecentedly handsome" figure, but by the end of the first year he had not submitted one, probably because he was too busy preparing his own book on the travels of Marco Polo.

ASQUITH, MARGOT (TENNANT), COUNTESS OF OXFORD AND ASQUITH *See* Oxford and Asquith, M.T.A.

ASTAIRE, FRED (ȧ-stâr') May 10, 1899-
Dancer; actor

Address: b. c/o Metro-Goldwyn-Mayer, Culver City, Calif.; h. Beverly Hills, Calif.

The performer who is regarded as having revolutionized Hollywood's approach to film musicals and brought virtuosity and refinement to the distinctly American dance form, the tap dance, is Fred Astaire, of whom *Theatre Arts* wrote in 1936: "His proficiency . . . is the pure manifestation of modern tap dancing, in which the off-beat Negro rhythm has been combined with the old native clog dance of America's Irish and Lancashire immigrants. It has been whipped up to a frenzy of speed and precision . . . but it is charged with a dry wit that is purely Yankee heritage. It is as modern as the streamlined flier, and as sensitive as the rhythms of the old psalmists."

Columbia Pictures

FRED ASTAIRE

Fred Austerlitz—until he was seventeen Astaire used his family's name—was born in Omaha, Nebraska, on May 10, 1899. He is the son of Ann (Geilus) Austerlitz and Frederic E. Austerlitz, who was a traveling salesman. When Fred was four he began taking ballet lessons at the school where his sister Adele was already studying, and before many months had passed both of them were appearing in various local entertainments. By the time Fred was five and Adele six and a half, the Austerlitz' realized that the two children had unusual talent, and it was agreed that they should be taken to New York for further training.

For the next few years Adele and Fred attended a singing, dancing, and dramatic school near Times Square. This establishment was owned by Ned Wayburn, who is said to be the originator of modern tap dancing; and it was on his advice that they began studying the syncopated dance form which was to become their specialty. Mrs. Auterlitz tutored the children in elementary school subjects, for they had little time to attend a regular school, and she served also as their manager and promoter. Astaire has spoken of "her patient determination, her unselfish devotion, her fine diplomacy, her common sense."

Two years after their arrival in New York Adele and Fred began making vaudeville appearances, the first in New Jersey; not long after, touring on the Orpheum circuit, they made an appearance in New York itself. Their engagements during these next years were infrequent, however, for they were too young to be wage-earners under the State's child labor laws, and Adele's rapid growth had made them a badly matched dance team. But by 1916 they had reached the working age, and Fred was as tall as his sister. With an act entitled "Fred and Adele Astaire in New Songs and Smart Dances," they were given another opportunity to appear in New York, and by one reviewer, at least, they were praised as "the most talented youngsters who had yet graced the vaudeville stage." They toured the United

ASTAIRE, FRED—*Continued*

States and Canada with their act, and in 1917 were given their first show contract, parts in *Over the Top.*

Their success in this Sigmund Romberg['45] musical revue brought to an end the Astaires' vaudeville appearances. They were given dancing assignments in *The Passing Show of 1918,* and in 1919 they had parts in Fritz Kreisler's['44] operetta *Apple Blossoms,* which ran in New York and then toured until 1921. Although the brother and sister had no speaking roles in either of these shows, according to Lincoln Barnett (*Life,* August 5, 1941), "their adroit rhythmic comedy and liquid but precise teamwork made a profound impression on New York." Critics unable to determine the origin of their adopted surname decided that it was French and applauded "the Parisian chic of the young Astaires."

The team achieved stardom in 1922 in the musical *For Goodness' Sake,* in which they had speaking as well as dancing parts; and later that same year they played in *The Bunch and Judy.* The following season *For Goodness' Sake,* with the Astaires in the cast, was taken to London, where, retitled *Stop Flirting* for British audiences, it repeated its New York success. The American couple became established as international celebrities, causing even the staid London *Times* to write: "Columbus may have danced with joy at discovering America, but how he would have cavorted had he also discovered Fred and Adele Astaire!"

During the remainder of the twenties the Astaires danced through many more successful productions, both in New York and London. In 1925 it was the Gershwin-scored *Lady Be Good* in which they were starred, and two years later it was Gershwin's *Funny Face.* These shows in turn were each taken to London. In 1930 the dancers appeared in the Ziegfeld production of *Smiles,* and the following year they played the leads in *The Bandwagon.* In this musical Fred Astaire not only received the customary praise for his dancing, but "an unexpected chorus of astonishment and delight at his newly revealed talents as a comedian." *The Bandwagon* was the last show in which Fred and Adele Astaire danced together. After the production closed in 1932 Miss Astaire retired from the stage to be married to Lord Charles Cavendish, the son of the ninth Duke of Devonshire. "She was a great artist," Astaire said of his sister, "incomparable and inimitable, and the grandest sister anybody could have."

The feeling was general after Adele's marriage that Astaire would never find the perfect partner his sister had been. Nevertheless, a few months later he appeared on Broadway with a new dancing partner, Claire Luce, in *The Gay Divorce* (1932). The critical consensus was that two Astaires were better than one, but the box office reception kept the musical going for eight months.

While *The Gay Divorce* was still running, RKO offered Astaire a contract. This surprised the dancer because, as he put it, "an inventory of my face would disclose no feature which could be hailed as what the successful movie star should wear." In the late spring of 1933 he nevertheless signed the contract, with the idea of becoming an actor, for he felt that dancing would never be popular in films since "the flat surface of the screen seems to rob it of its three-dimensional quality." Although his first screen tests were not very favorable, he was assigned a featured dancing part opposite Ginger Rogers['41] in *Flying Down to Rio;* then, before production started, he was lent to MGM for a number in *Dancing Lady* (1933). Afterward he returned to RKO to make the *Rio* picture, in which he and Miss Rogers, with the colorful "Carioca," initiated the first of a long line of dancing vogues.

The "rushes" of the film convinced Astaire that his screen dancing appeared ponderous and his angular face grotesque. When he could not persuade the studio either to remake or delete his numbers, he left for London with *The Gay Divorce* before the opening, determined to forget motion pictures. But the release of the picture in New York in late 1933 changed his mind for him. Such reviews as "Fred Astaire is a new personality that should hit" and "the chief attraction is . . . the agile dancing of Fred Astaire" caused his studio to cable him to come back to Hollywood as soon as possible; and Astaire returned to begin the long series of pictures that was to make him the best-known and highest paid dancer in the world.

The first of these pictures was the celluloid adaptation of *The Gay Divorce* (1934), with both Miss Rogers and Astaire as the stars. (According to *Life,* the picture was renamed *The Gay Divorcée* by the Hays['43] office on the assumption that a divorcée might be gay, but a divorce should not.) Within a year after the release of the film, it was said that Astaire and Rogers had become the biggest moneymaking team in motion picture history, and RKO had Astaire's legs insured for a million dollars.

In the next five years the couple made seven pictures: *Roberta* and *Top Hat* (1935), *Follow the Fleet* and *Swing Time* (1936), *Shall We Dance?* (1937), *Carefree* (1938), and *The Story of Vernon and Irene Castle* (1939). The reviewers over the period were fairly consistent in their praise of the Astaire-Rogers dancing. For example, of his work in *Roberta,* considered one of their two best pictures (*Top Hat* was the other), the New York *Times* critic remarked, "Mr. Astaire's dancing is not only an esthetic excitement, but also comedy of a unique and lofty order." When in 1939 Miss Rogers abandoned musicals for straight roles, Richard Watts wrote, "No one has quite made me forget Adele Astaire, but Miss Rogers came closer to arranging any such forgetfulness than I had thought possible."

After Miss Rogers' departure Astaire was given a succession of partners: in the short space of six years six ladies danced through eight of his pictures. The first was Eleanor Powell, who appeared opposite him in *Broadway Melody of 1940;* and at the end of the same year, 1940, Paulette Goddard made *Second Chorus* with Astaire. Neither of these stars was considered the perfect successor to Miss Rogers, although Miss Powell, actually rated a good dancer, perhaps suffered from following so quickly after her predecessor. In 1941 Astaire was teamed with Marjorie Reynolds in the musical *Holiday Inn,* with Bing Crosby['41] singing the Irving Berlin['42] melodies.

His next and most popular partner was Rita Hayworth, who danced with him in *You'll Never Get Rich.* One enthusiastic reviewer remarked that she was able to match her partner "step for step," while Astaire himself declared that she is a born dancer. In 1942 Hayworth and Astaire were paired again, in *You Were Never Lovelier*—"another triumph for Miss Hayworth" and one more example of Astaire's "brilliant inventiveness" as evidenced by his choregraphy. The following year the dancer appeared opposite Joan Leslie in *The Sky's the Limit.* In this picture, a lesser success, he performed what is called the speediest dance of his career. Dancing on top of an ornate bar among glasses, bottles, and siphons, he moved so quickly that it was necessary to film the scene in twenty-second takes with a special camera and speed film.

In early 1944 Astaire made *Ziegfeld Follies,* a picture filled with numerous name stars, in which he danced for the first time with Gene Kelly '45, considered a potential rival, and a new dancer, Lucille Bremer. At the end of the year he made another film with Miss Bremer, the Technicolor fantasy *Yolanda and the Thief.* Released in November 1945, this Metro-Goldwyn-Mayer film was applauded for its rich and tasteful mounting by all the critics, most of whom complained, however, that it was too long and too slow-moving. All agreed that Astaire danced with his accustomed brilliancy, that he should have appeared oftener in the film, for it was his and his partner's performances that added excitement and gaiety. *Blue Skies,* a Paramount film on which Astaire was working in late 1945, will be his last: he announced he would retire from dancing, take a rest, and then become a producer.

Of Astaire's dancing Morton Eustis has written: "Out of an innate sense of form, of balance, and of rhythm complemented by a natural gift of showmanship, Astaire has created a diversified group of dance patterns . . . perfectly adapted to his own special capabilities as a dancer. . . .[They are] a blend of song and dance, sense and nonsense, beauty and agility with an almost universal appeal." According to *Life,* "Astaire dances to American rhythms and with an air of gay spontaneity that consummately reflects the folk origins of his art. Debonair, exultant, amused, he has imparted to the tap dance an elegance and mobility of which the cloggers and minstrels of the last century never dreamed. As the Astaire technique evolved, the American Dance washed off its black pigmentation and put on white tie and tails."

The success of the man with "the sophisticated toes" has not been achieved and maintained without a great deal of work and worry on his part. Concerned over the fact that as his own choregrapher he may someday exhaust his supply of ideas, he will interrupt golf matches or week-end trips to put a sudden idea into action. He is never completely satisfied with his dancing and, as a result, can never sit comfortably through a showing of his pictures. Two of them, he says, he has never seen at all.

Fred Astaire feels that dancing is not merely an exhibition of footwork, but also an expression of an idea—the rhythmical telling of a story in an effortless manner, which must be easily understood by the audience. He is also of the opinion that in both plays and motion pictures a dance must be an integral part of the plot, emerging as "the natural outcome of an action and not an insertion." For that reason, Lincoln Barnett says, when Astaire creates an original dance routine "it is roughly the equivalent in mental exertion to composing a sonata or writing a one-act play." In his motion picture work, Astaire, a perfectionist, spends several weeks practicing his numbers after he has completed the choregraphy. His final touch on a routine is to refine his body movements, gestures, and expressions before a mirror. His first teacher, Ned Wayburn, holds that Astaire is "the first American tap dancer to consciously employ the full resources of his arms, hands, and torso for visual ornamentation."

Astaire is considered not only a designer of dance routines, but also "a choregrapher in terms of camera angles." Before his entry into motion pictures dancers were "photographed in pieces"—during a sequence the camera would shift its focus to different parts of the body, using trick shots taken from the floor, ceiling, or through lattice work. To reverse this process, to keep the flow of movement intact, Astaire has his numbers filmed "straight"—his entire body is kept in view during a dance. Each take is filmed with three cameras working simultaneously, and the best shots of each sequence are pieced together. The average dance is shot from six to ten times, each time in its entirety.

The dancer and Phyllis (Livingston) Potter were married in July 1933. They have three children (two sons and a younger daughter), the older son being the child of Mrs. Astaire's first marriage. The dancer is said to have an aversion to publicity. He enjoys playing golf and tennis, fishing, and breeding and racing horses, and is considered an accomplished pianist and accordionist. A member of ASCAP, he has done some composing—of his five published songs three were popular for a time: "Just Like Taking Candy From a Baby", "No Time Like the Present," and "I'm Building Up to an Awful Let-down." In the fall of 1944 Astaire returned from a six-week USO tour of France, Belgium, and Holland. He had taken with him a number of his one hundred pairs of dancing shoes, but once, when there was a hitch in the arrangements, Astaire danced in heavy combat boots.

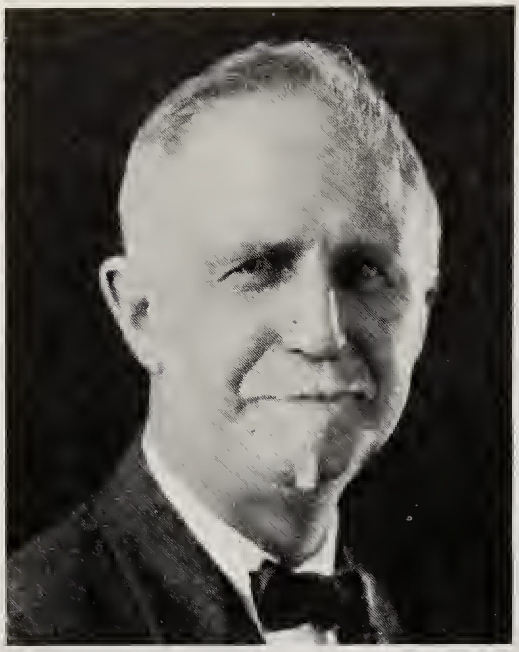
BABSON, ROGER W(ARD) July 6, 1875-

Statistician; economist

Address: Babson Park, Wellesley Hills, Mass.

The man who, it is said, has made more money out of statistics than anyone else in the United States is Roger W. Babson, known around Boston as "the seer of Wellesley Hills." Babson's Reports, Inc., sells his statistical serv-



J. E. Purdy Co., Inc.

ROGER W. BABSON

ice throughout the United States and Canada; the syndicated Publishers' Financial Bureau distributes his views to newspapers. He is the founder of Babson Institute, a business school; and of Webber College, exclusively for women interested in a business career. He is the author, also, of many books on money and investments—and on religion in relation to business and better living.

Roger Ward Babson, whom *Time* has called "a combination of Yankee piety and shrewdness," was born in Gloucester, Massachusetts, July 6, 1875. The son of Nathaniel and Ellen (Stearns) Babson, he is directly descended from Israel Putnam, the Reverend John Wise, and John Rogers: "I can see myself as a combination of these fighting, religious, and educational strains," he declares. Another strain, the commercial, he adds, comes from his sea captain ancestry. His father was the leading dry-goods merchant of Gloucester; as a boy Babson would go with him on his horse-and-buggy selling trips. Roger also spent much of his boyhood on his grandfather's dairy farm, of which he says, "I owe more to that farm than to any educational institution." In Gloucester he played mostly with children of the fishermen's families, and he organized a gang which would "periodically go to Nob Hill and lick the rich boys."

His mother, disapproving of the public schools, sent her young son to a private school; but he was considered an unruly youngster and dismissed. He then went to the Collins School for six years. After a rest following a nervous breakdown he entered the Gloucester High School in 1890. The school had a military training course, which he liked, and he became captain of his company. Because he did not take the regular scientific course (his father had insisted that he study bookkeeping) Roger got a diploma at graduation in 1894 marked "Special Course." Religion, during these years, was a major interest of young Babson. "The greatest event of my life was my conversion," he reports. After that he was a changed boy: he taught a Sunday school class and joined the church organizations for young people. As a Congregationalist, Babson has throughout his life continued to be active in church work.

He had wanted to go to a Western college, but his father chose the Massachusetts Institute of Technology for him. It was all hard work, Babson says—there were no dormitories, recreation, nor sports, no religious instruction, no student aid. "I hated the place and all its courses." He took civil engineering, he says, because it was the first course listed in the catalogue and received his B.S. in 1898.

Apparently the various jobs he had held during his school years had interested young Babson more than his academic work. He earned his first money by carrying water for Chinese laundrymen—and for circus elephants. During high school vacations he was given his own tract of land where he raised vegetables, which he sold from house to house. His next job was installing doorbells and other electrical equipment in Gloucester; during the summers of his college years he worked, first as timekeeper, then as a State highway engineer. His father had always emphasized the importance of getting into a "repeat" business, like investment banking or insurance. So, when he was graduated, Babson first went to work for a small Boston investment house, but was discharged when he started making inquiries concerning profits in the sale of bonds. He then set up his own bond-selling business in New York, but left this to go into business with a public utility bond firm. He began to invest in various light and power companies, and became vice-president of the Adirondack Light and Power Company. "In the years which followed, my profits grew rapidly," he says, largely through consolidations with other companies. But when the profits from his own statistical business increased, he decided to retire from active participation in the utilities field.

In March 1900 Roger Babson was married to Grace Margaret Knight, the daughter of a New Hampshire preacher, and a student nurse at the time of her marriage. "I always liked bright, jolly girls, full of the dickens," he writes. But Grace Knight was of a different type. She was quiet, intelligent, did not talk much, but, he adds, "she let me tell her how wonderful I was. . . .I get the honors, but she has always been the real works." The Babsons' only child, Edith Low, was born in 1903.

When he became seriously ill with tuberculosis shortly after his marriage, Babson was told that he must spend most of his time out of doors, preferably in the West. He was determined to stay in the East, however, and moved to Wellesley Hills, Massachusetts, where he worked in an open-air bedroom. He learned to analyze and tabulate business reports for bankers. By 1904 he had incorporated the Babson Statistical Organization, with a capital of twelve hundred dollars, and himself and his wife, respectively, as president and treasurer, and as sole stockholders. "Our underlying purpose was to furnish protection to the investor in relation to his capital and income." As his business expanded he built an office building, where he continued to work in rooms with wide-open windows, wearing a special coat with an electrically heated pad in back; his secretary wore mittens and did her typing by striking the keys with rubber hammers—and Babson regained his health.

The panic of 1907 aroused in him an interest in making a study of stock exchange transactions—thus the "Babsonchart" was started. Babson's theory of depression and prosperity is based on Newton's law of "action and reaction." The Babson Reports Service (for which the Babsonchart is used) suggests to clients when to buy and when to sell. "Our forecast of future events," he explains, "is based on the assumption that the law of action and reaction applies to economics and human relations, en masse, as it applies to mechanics. Thus we assume that abnormal depression must follow abnormal activity; that lower prices must follow higher prices, or vice versa; and that we as classes or nations must ourselves get what we give and must prosper as we serve."

Babson states that his organization clearly forecast the 1925-35 business cycle. It was on September 5, 1929, that he made his most famous prediction—he foretold a drop in stock prices of sixty to eighty points. When, after three weeks, industrial shares dropped 50 per cent, Babson "soon became a lion among stock market prognosticators." He began a column, *Be Right With Babson,* for a New York newspaper. According to Ralph Robey, writing in the *Nation*, Babson had not always been so fortunate in his predictions. During 1926 the statistician had advised clients to "hold their funds in good liquid condition," while all the time the stock market moved upward. Even in 1927 he had urged his clients to stay out of the market. His blanket forecast for all of 1928 was: "Any major movement should be on the downward side." But as the market continued upward, "the Babson follower was more than 25 per cent worse off than the foolish speculator who tossed a coin." Babson explains, however, that his mistakes in forecasting business conditions have "usually resulted from being too early." In several articles for the New York *Times* in 1913 he forecast the First World War.

Other interests of Babson's, in the early part of his career, were the American Public Welfare Trust for promoting hygienic products (i.e., paper towels), and distributing rules for health; and the Gamewell Company, manufacturing red fire alarm boxes, installing fire prevention devices. The Babsons during these years also made several trips abroad to increase their clientele and to set up European services of the Babson agencies.

Upon the outbreak of the First World War, Babson became secretary of the Society to Eliminate the Economic Causes of War, which adopted a "Declaration of Independence" that foreshadowed the Versailles Treaty. During the war he worked in the Government as director general of information and education, under the Secretary of Labor. In 1917, with the approval of President Wilson, he wrote a booklet for the armed forces, entitled *Why Are We Fighting?* In 1920 he organized the various peace societies that sent delegates to the National Council for the Limitation of Armaments. Shortly after that he gave up active work in peace movements, but he believes that "world peace will be brought about only by extending equal opportunities to the people of all nations who meet a certain character test and observe certain rules."

The Babson "Experiment in Industrial Democracy" of 1916-24, a service established for Babson employees—free hospital service, dental clinic, community building, moving pictures, salary bonuses—was, said its originator, a failure. The trouble with "profit sharing," according to him, is that it works when the employer's profit goes up, but when it goes down in lean years the employees are dissatisfied because they can no longer get bonuses. "I am sure that the nation is not yet prepared for it." Babson once expressed himself as being against socialism as a form of government: "Any nation which now attempts to operate under a socialist system in competition with nations operating under private control would be licked to a frazzle." Once a Republican, but an independent since 1908, Babson is proud of his association with Theodore Roosevelt and his acquaintance with other Presidents; he admired Wilson for his peace principles; he approved of Coolidge, but not of Hoover '43.

In 1919 the Babson Institute near Wellesley Hills was founded, a school described as the first of its kind in the United States, and perhaps the first anywhere. The endowed school provides an intensive two-year course in business training for selected young men, with the idea that they would step immediately into responsible positions. Courses are given on finance, production, distribution, and personal efficiency, and students are taught to use dictaphones and to work with secretaries. There are no written examinations—"the test consists in whether or not the student has secured a position. If so, he gets a diploma; if not, his tuition is returned." Eight out of ten of the Institute's students are said to have succeeded. By 1935 two women were admitted to every class of twenty. The community of Babson Park, as the Babson Park Company, has its own post office, bank, radio station, movie house. The motion pictures are carefully censored; the radio never puts on the air any liquor, cigarette, patent medicine, or other so-called "objectionable" advertising. Babson owns a twelve-thousand-acre ranch in Florida (Babson Park in Polk County), where Webber College, a special training school for women, was started in 1927.

Lecturing, particularly before Chamber of Commerce meetings throughout the country, was a Babson occupation for several years. He started his long writing career in 1910 with an article in the *Saturday Evening Post* called "Mistakes of Investors." He did his first feature work for the Scripps Syndicate; and in 1923 started his own newspaper syndicate, Publishers Financial Bureau, which distributed its services to some four hundred newspapers.

By 1935, the year which saw the publication of his autobiography, *Actions and Reactions,* he had written thirty-eight books. *Washington and the Revolutionists* (1934), which discussed new personalities and policies in Washington, was commended as "brief, impartial, and interesting." *If Inflation Comes* (1937), was a discussion of possibilities of revolution as well as of inflation. Babson's suggestion was that ownership of a small farm was a good hedge against both. Also, he felt that one ought to learn the art of defensive war-

BABSON, ROGER W.—*Continued*

fare; and he advised young people to join a labor union, although in a later book he declared that in no case does labor union activity raise the real wages of workers. In *Looking Ahead Fifty Years* (1943) Babson anticipated developments in business, economics, and education. He declared that 20 per cent of the people are at times unemployable because of our faulty educational system. The book was chiefly criticized for its "general looseness of thought," its "many extreme views," and also for its "failure to come to grips with the momentous problems of the future." Babson has said that his purpose in writing all these books has been "to present great subjects so that the man on the street may understand and enjoy them."

Babson believes that the facts of religion are based upon and correlate with physical or scientific laws. "The study of the spiritual life is in the same condition in this twentieth century that the study of the physical sciences was in when Newton was born in 1642," the economist writes. He believes the Bible should be studied in school, and he himself presents a Bible to every new employee in his organization at Wellesley Hills. One of his books, *How To Increase Church Attendance,* was published in 1936. From 1936 to 1938 Babson served as moderator of the Congregationalist Christian Council. *Can These Bones Live?* was written in collaboration with Dudley Zuver and published in 1945. In its comment on the book, the New York *Times* said, "Mr. Babson is the *enfant terrible* of the churches, and in these pages he, with his collaborator, lashes the money-changers in the temple."

In the New Deal era Babson occasionally questioned certain of President Roosevelt's '42 social policies. "Fundamentally," he wrote, "the only real security is high spiritual and intellectual character. . . .If the people do not have strong character, their Government insurance and security are useless." In 1940 Babson was unanimously nominated for the Presidency by the American Prohibition Party. In his convention speech he said that the party sought "a new mode of attack." While the main object was still to crush the liquor traffic, the goal could best be reached "by working for a spiritual awakening through churches, schools, movies, radio, and influential publications." The party, he said, should, furthermore, "work to keep this country out of war by insisting upon both friendly international relations and adequate defense."

In 1945 an idea Babson had conceived twenty years before became of unique importance in the future of American aviation. Having need for a good relief map of the United States with which to teach his students of business administration the material resources of their country, he organized a national advisory committee of educators and industrialists from each state to aid in the design of the largest relief map of the United States in the world. The map, costing two hundred thousand dollars and taking fifteen years to complete, shows every mountain, valley, river, prairie, and forest. On Babson's offer of the use of his giant map to the Government, Air Force technicians were dispatched to study it. It was reproduced, inch by inch, for use at the two hundred Government airfields all over the country. Eventually, it is expected, each commercial airport will also have a replica of its own geographical section of the map at its briefing station.

Less active in church work and politics than in previous years, Roger Babson during the early forties has confined his interests to statistics, to his syndicated column, and to his various hobbies. His first hobby, some years ago, was a backyard garden—most of the profits of which came from articles he wrote about it for *Garden Magazine.* He collects old sailing maps as well as postage stamps; he collects and reads "good cheer" books. But Mrs. Babson, he says, is the real collector, her most valuable acquisition being her Newtoniana —all the works of Newton and the writings about him. Babson doesn't care particularly for the theater or music; but says he especially enjoys discussing new ideas and inventions: "I have always some prospective patent to work on." He is interested in air-conditioned beds, and a system whereby men may "subscribe" for clothing, the garments to be sent out periodically. "My chief hobby at the present time is trying to do things which will carry on after my death. This consists primarily in giving time to my grandchildren"—Babson's daughter, Mrs. Mustard, has five children. "All parents should give more time to their children, and all grandparents should give more time to their grandchildren. Children and grandchildren will remember us far more for the time we give them than for the money we leave them."

BAILEY, SIR DONALD COLEMAN

Sept. 15, 1901- British Government engineer

Address: b. c/o Experimental Bridging Establishment, Ministry of Supply, London

One of the military inventions of the Second World War that can look forward to a continued usefulness in peace is the Bailey Bridge, designed by British engineer Sir Donald Coleman Bailey. Called "the most remarkable bridge in the history of military operations," it proved its practicality and versatility in campaigns in Afria, Europe, and Asia, where it was used to span bomb craters, ravines and gorges, or rivers more than a thousand feet in width. A non-military usefulness is seen for it in the reconstruction of devastated Europe and in undeveloped regions of the world where slow ferries are the only means of crossing water barriers.

Born in Yorkshire in 1901, Donald Coleman Bailey later lived in Cambridge, where he took his first technical courses at the Leys School. Dams, reservoirs, and bridges filled his mind at an early age. This "water complex" once led the boy to expend three shillings for an old iron bedstead, which he then proceeded to carry down past the King's Parade in Cambridge to the River Cam. It was his intention to convert the bedstead into a boat by means of painted canvas, and to sail it on the river—but the outcome of that project is not recorded. When young Bailey was ready for college, an engineer friend of his father advised the elder Bailey to send the boy to Sheffield University, from which in due course Bailey received his engineering degree. And in the late twenties he was the engineer for a new reservoir in the city of Sheffield. At first attracted to railroad engineering, he remained in that field for only a short time. In 1929 he joined the Experimental Bridging Establishment of the Ministry of Supply as a civilian staff engineer, later being promoted to the position of assistant superintendent.

When the Second World War broke out Bailey had been working with experimental bridges for military use for about ten years. The British reverses suffered in the Battle of France which culminated in the disaster of Dunkerque in June 1940 had made it plain that bridging equipment would have to be improved to bear the armaments of a greatly increased mechanized warfare—the forty- and fifty-ton loads of, for instance, the British Churchill and Matilda tanks. But Bailey seems to have crossed his bridge before he came to it—he had been thinking of a new type of span for some time when, in late 1940, he drew a rough sketch of the bridge that was to be named after him. At that time chief designer of the E.B.E., the engineer was called to a conference to discuss the failure of a new bridge under test. On his way to the meeting he sketched the design he had in mind on the back of an envelope and showed it to his companion, an officer in the Royal Engineers.

The result was that Bailey was authorized to design his new bridge—a strong, comparatively light steel prefabricated sectional span that could be erected easily, quickly, and quietly (under fire if necessary), and whose interchangeable parts would simplify repair and permit variation in length and strength. Bailey completed his design within six weeks, and by February 1941 work had been started on a seventy-foot knock-down bridge. Within another three months the structure was ready for its first test.

The test bridge was put together in only a few hours. But when three heavy tanks were sent across it, the structure collapsed, whereupon Bailey sought and found the cause of the trouble. One of the tanks had veered into two of the main steel struts which had consequently given way. A truck was at once dispatched to a factory miles away for spare parts. By nine the next morning the bridge had been rebuilt and proved successful. Here was a practical demonstration, which Bailey had not scheduled, of the quick repair of the bridge and the easy replaceability of its parts. Quantity production was begun about four months later.

British Official Photo.
SIR DONALD COLEMAN BAILEY

The girders of the Bailey Bridge are constructed from lattice-work panels or sections, each ten feet long, which are locked together with steel split pins. Between these girders, which resemble a child's Meccano toy, are laid transoms, and on them are placed wooden planks to form the roadway. The strength of the span may be increased by placing two, three, or more girders side by side on each side of the roadway, or by placing a second or third girder above the first. The notable feature of the bridge is its simplicity of erection and launching. The whole structure is put together on the near bank, its forward end equipped with an elevated false nose, the structure pushed over the gap on rollers, and the launching nose lowered on the far shore. In the war the launching rollers were brought across by men straddling the girders. Pontoons are only required for bridges more than two hundred and forty feet long. A pontoon bridge built across the flooded Maas in Holland measured four thousand feet, and even longer bridges were later built across the Rhine.

Bailey had designed a bridge that could be thrown across rivers in a short time. In one theater of war a 300-foot river was bridged in thirty-six hours, and in Burma five hundred men worked day and night for forty-eight hours to build the first bridge in history over the Chindwin River, more than a thousand feet in width. Since the basic method of erection is the same, regardless of the number of girders employed, and the parts are standardized, calculations required in the field were of the simplest. Panels were transported in three-ton trucks and hoisted in place by a squad of six men, who used only a few tools to join the parts, thus obviating the use of machinery. If necessary, the bridges could be strengthened while in position, and, if damaged, only the affected sections needed to be replaced.

By the end of 1944 an average of two of Bailey's bridges were being erected almost every day, so heavy was the demolition of existing bridges. Said Field Marshal Sir Bernard Law Montgomery '42: "This bridge is quite the best thing in that line we have ever had; it does everything we want"; and the comment of a

BAILEY, SIR DONALD COLEMAN—*Continued*

young American officer was that "the Bailey is really a marvelous gadget—you could make almost anything from a roller-coaster to an Eiffel Tower if you had enough pieces!" The United States forces adopted the Bailey as standard bridging equipment, and the Red Army was also given the plans.

To Bailey, who is characterized as modest and singularly unaffected, the designing of the bridge was all in the day's work. He is glad, he says, to have been able to "do something to help the troops." In recognition of his contribution to the victory, he was made an Officer of the Order of the British Empire, and later the engineer was knighted. Bailey and his wife live in Southbourne, in a house with a view of the English Channel. For relaxation he plays golf and reads detective stories. He is tall, slender, and blond, and, according to one description, has the "dome-like head of the deep thinker" and the "tenuous hands which bespeak the artist." He wears horn-rimmed glasses and is often seen in checked coat and cap. His young son Peter admires him particularly for his skill in assembling Meccano toy sets.

BAILEY, JOSIAH W(ILLIAM) Sept. 14, 1873- United States Senator from North Carolina

Address: b. Senate Office Bldg., Washington, D. C.; h. 513 N. Blount St., Raleigh, N. C.

The senior Senator to the United States Congress from North Carolina and chairman of the powerful Senate Commerce Committee, Josiah W. Bailey, is a dignified but very vocal Democrat who has been called one of the old-school orators of the Senate. An outspoken critic of the New Deal, Bailey has been withal a party supporter from his earliest voting years.

The Southern legislator was born Josiah William Bailey in Warrenton, North Carolina, on September 14, 1873. Son of Virginia-born Christopher Thomas and Annie Sarah Bailey, the boy inherited a religious tradition from his father and grandfather, both Baptist preachers. As he grew older he himself participated in church activities. (This background, later reflected in many of his Senatorial speeches, caused the press to nickname him "Holy Joe.") He attended Wake Forest College in his home state, receiving his Bachelor of Arts degree from that college in 1893.

In the year of his graduation young Bailey became editor of the *Biblical Recorder*, the official organ of the Baptists in North Carolina. During part of his fourteen-year editorship, he studied law under S. F. Mordecai and at Trinity College (now Duke University). When he left the *Recorder* in 1907 he continued his law studies for a year at the Wake Forest Law School. In 1908, at the age of thirty-four, he was admitted to the State bar and began to practice law at Raleigh. That year he also served as Presidential elector-at-large for North Carolina; some years later, in 1913-14, he was a member of the State Constitutional Commission. From 1913 to 1921 he held the position of United States collector of internal revenue in his state, and at one time was director and vice-president of the Wake County Savings Bank.

Bailey's political ascendency began with his rebellion in the middle twenties against party dictatorship in Democratic North Carolina. Although he was then unsuccessful in upsetting the political machine, his biting, forthright language won him the label of "crusading rebel." In 1928 he campaigned in North Carolina in support of the Democratic Presidential ticket. Two years later, after his offer of assistance to several possible Senatorial candidates was refused, Bailey announced his own candidacy. The fighting Democrat swept the State in the primary, and was elected by the largest majority ever given to a North Carolina Senatorial candidate. When Bailey took office in 1931, Weimar Jones, discussing the new Senator in the *Nation*, described him as "a scholar whose devotion to abstract principles of right and wrong, and specifically to righteousness in civil and political affairs, borders on fanaticism." The North Carolinian was in 1945 serving his third term in the Senate, having been re-elected in 1943 by a ten-to-one majority over his Republican opponent.

Bailey took a strong stand on certain issues in legislative sessions. In 1935 he led a filibuster against an anti-lynching bill, promising the Senate, "We'll speak day and night if necessary." Two years later, when the bill was once more before the upper house for passage, Bailey said that while he did not like the measure itself, he approved of its objective, the extermination of lynching. In May 1944 the Senator again participated in a filibuster, when he was one of the Southerners to contribute to the defeat of the anti-poll tax bill on the Senate floor.

The Senator opposed the New Deal policy on several issues. He was one of those who helped to defeat President Roosevelt's '42 Supreme Court reorganization plan in the early days of the Administration. In March 1943 he helped to repeal the President's order limiting annual salaries to twenty-five thousand dollars after deduction of taxes. In May, with the majority, he voted against Presidential use of war emergency funds for the National Resources Planning Board. (This long-disputed war and postwar planning agency was ended two months later by Congress.) Bailey is on record as approving United States postwar participation in maintaining the peace; and in October 1943, in a poll taken by a news service, he supported the House's Fulbright '43 resolution for postwar collaboration.

An isolationist until 1941, Bailey repudiated his noninterventionist policies during Senate debate on the Lend-Lease bill. *Time* Magazine on March 3, 1941, reported: "Conservative Senator Josiah William Bailey of North Carolina, who has been 99 per cent against the Administration, except when campaigning for re-election, now recanted his onetime isolationism, ate his words with such solemn gusto that a hushed, impressed Senate clustered around his desk so as not to miss a syllable." Bailey stated his reversal of principle simply: "I have utterly changed my mind. . . . I am advocating intervention with all its implications. I am not hedging. All my life I have looked a thing in the face and argued it as it is." The New York *Times* editorially called his action "a brave change of mind."

The Senator upheld Administration policy in April 1943 when he urged Senatorial support of the President's veto of the Bankhead bill to increase farm prices, warning that price stabilization was imperative. The next year, in February, he contributed to the defeat of food subsidies by voting against an amendment to the Commodity Credit Corporation bill, providing for an appropriation for the subsidies. Again, supporting the Administration, at the end of 1944 Bailey voted for confirmation of the President's nominations to the State Department.

Bailey has been prominent in the dissension within the ranks of the Democratic Party, in 1943 proposing a resolution to amend the Constitution to prevent future Presidents from serving more than two terms. In December 1943 Senator Joseph F. Guffey '44, an Administration supporter, accused Southern Senators, including Bailey, of an "unpatriotic and unholy alliance" to defeat the soldier-vote bill. From the Senate floor Bailey answered with considerable heat, declaring that the "scorned" Southern Democrats could form a Southern Democratic Party of their own. Then, in March 1944 he was one of the principals in the Senatorial "revolt" against "Executive domination" which was set off by the resignation of Alben W. Barkley '41 as Senate majority leader.

In early 1945 Bailey once again demonstrated his rejection of New Deal philosophy. As chairman of the Commerce Committee, Bailey presided at the hearings at which Jesse Jones '40 and Henry Wallace '40 testified in the dispute over Wallace's appointment to Jones's Secretaryship of Commerce. Favoring the conservative Jones, Bailey pronounced former Vice-President Wallace a "dangerous" man. It was reported that Bailey had gone to the White House in January to urge the President to retain Jones as Commerce Secretary. Bailey was the leader of the opposition against Wallace's appointment and hence one of the central figures in the controversy that raged around the appointment. And it was Chairman Bailey who filed the Commerce Committee's reports to the Senate in which confirmation of Wallace was advised against. But when Wallace's nomination came to a vote, Bailey voted for confirmation of the appointment. He did this only after passage of the George bill had stripped the Commerce Department of all vital lending agencies. By a Senatorial vote of 56 to 32 Wallace became Secretary of Commerce. (Bailey attended the informal installation ceremony of the former Vice-President.) Shortly thereafter, in what the press called a "peace move," Bailey appointed a subcommittee headed by Senator Claude Pepper '41 to conduct with Wallace a survey of domestic commerce. The Commerce Committee chairman also named a subcommittee to work with the new Secretary on matters of foreign commerce.

The legislator's stand on States' rights and private industry has been clearly indicated in his Congressional record. In 1943 Bailey defended fire insurance companies against prosecution under the antitrust laws. The *Congressional Digest* of October 1944 carried Bailey's arguments for States' rights in the control of the insurance business. In December 1943 he voted against the Federal soldier-vote legislation, favoring the State ballot. Bailey's amendment to the flood control bill in November 1944, which, he argued, was imperative for the "protection of private industry against a Government monopoly," was rejected by the Senate. As chairman of the Commerce Committee, Bailey attended the international civil aviation conference in Chicago in late 1944. His committee is expected to play an important part in planning policies for future commercial aviation. It is known that Bailey opposed Government ownership of transoceanic service. Another Federal project which was referred to Bailey's committee and to which he is opposed is the Missouri Valley Authority.

JOSIAH W. BAILEY

Senator Bailey has initiated some significant wartime legislation. The Bailey-Brewster bill, offered in 1944, provided for the assignment of 4-F draft registrants to work units. This measure was defeated, but 1945 saw the introduction in the House of a similar manpower measure designed to alleviate the critical manpower situation. This was the May-Bailey bill, which provided limited national service for deferred men between the ages of eighteen and forty-five. Jointly sponsored by Bailey and Representative Andrew J. May '41, the bill was referred to as the "work or fight" bill and had the support of Roosevelt, the military and naval Chiefs of Staff, and leading Government officials. However, the bill met the combined opposition of organized labor and industry. Both the CIO and the A. F. of L. were against the measure; and Ira Mosher '45, president of the NAM, voiced that group's disapproval. After lengthy debate in the House, the May-Bailey bill was passed February 1 and proceeded to the Senate. Here it was "bogged down" in the Senate Military Affairs Committee, and when the committee finally reported on February 22, it offered a drastically changed manpower bill. Thus the May-Bailey bill, as such, never came to a vote in the Senate. That body debated various manpower measures attacked from some quarters as "milk-and-

BAILEY, JOSIAH W.—*Continued*

water" cures. When Bailey endeavored to apply the principle of the May-Bailey bill to the legislation under consideration, he was "soundly beaten." The Senate finally passed the Kilgore['43]-O'Mahoney['45] compromise bill.

In June 1945 Bailey supported President Truman's['45] fight to extend the reciprocal trade program by permitting a 50 per cent reduction in existing tariffs in exchange for concessions obtained by the United States. (Previously Bailey had proposed a modifying amendment to the reciprocal trade bill which would have forbidden reduction of duties on strategic metals and minerals.) Bailey's Senate Commerce Committee in early July rejected Senator Pat McCarran's bill to establish a single American company to handle international air commerce and also turned down an amended version which proposed to set international lines apart from domestic companies. Absent from the Senate during the history-making roll-call vote on the ratification of the United Nations Charter on July 28, 1945, Bailey, however, sent word that he would have voted "Yea" had he been present.

During September 1945 Bailey opposed an increase in state unemployment pay benefits; the Senate Finance Committee defeated the Kilgore bill in a vote of ten to eight. With Representative Brooks Hays of Arkansas, Bailey in the same month introduced a rural industrialization bill. Seen in utility circles as a forerunner of much anti-utility legislation if passed by Congress, the bill proposed a Commerce-Labor-Agriculture program to encourage the setting up of small businesses in rural areas and stressed the removal of "handicaps" for such business, including high electric and transportation rates and inadequate utility services. Bailey made known his stand on several important issues in the month of October. He supported the President's nomination of Raymond S. McKeough to the Maritime Commission (McKeough, ardent New Dealer and a Midwest regional director of CIO's Political Action Committee, was approved by the Senate committee); he declared himself in favor of universal military training, and supported the President on sharing scientific development of nuclear energy but retaining the secret of the atomic bomb's manufacture. In the Palestine crisis, Bailey threatened to fight in the Senate any move made by the United States toward assuming responsibility for the setting up of a Jewish state.

The Senator holds honorary Doctor of Laws degrees from Wake Forest College (1931), Colby College (1938), and Duke University (1941). He also received the Doctor of Letters degree from Elon College, North Carolina, in 1939. He is an honorary member of the Omicron Delta Kappa fraternity. Bailey has been married to the former Edith Pou since August 16, 1916; their five children are James Hinton Pou, Annie Elizabeth, Josiah William, Edith Pou, and Sallie. The family home is in Raleigh, North Carolina.

Bailey is an eloquent speaker, given to biblical and historical allusions. In a Senate debate he once spoke of John L. Lewis['42] as "that modern Catiline, unmatched by any Cicero so far, at the head of the mine workers." On one occasion, when answering an attack by Secretary of the Interior Harold L. Ickes['41], Bailey delivered a sixty-eight-hundred-word oration on forgiveness. He has a resonant voice and emphatic manner, coupled with a habit of desk-pounding which has caused him "to split a knuckle at least once." Of medium build, the dignified Southerner has piercing eyes and a lean, angular face. While he has been described as "shrewdly amiable," he rarely smiles, and his sober demeanor is said to give little hint of talent for expansive expression. When Bailey asked Congress in early 1944 to appropriate twenty thousand dollars to survey the fishing resources of the country, the newspapers carried amusing reports of the session. One paper remarked: "Make no mistake about it—Bailey's a fisherman. He thinks nothing of inviting a dozen people out to his cabin at Beaver Dam for a fish dinner and not wetting a line until 5:00 P. M."

BALDWIN, WILLIAM H(ENRY) Sept. 17, 1891- Public relations counsel; social service leader

Address: b. National Urban League, 1133 Broadway, New York City; Baldwin and Mermey, 205 E. 42d St., New York City; h. New Canaan, Conn.

A descendant of a long line of public-spirited citizens of Colonial New England stock, William H. Baldwin is an active worker in the cause of the Negro and also one of the top public relations counsels in the United States. As president of the National Urban League, an organization devoted to social service among Negroes, he is carrying on a work inaugurated by his mother in 1910.

Born in Saginaw, Michigan, on September 17, 1891, William Henry Baldwin is the son of William Henry Baldwin, Jr., and Ruth Standish (Bowles) Baldwin. The first record of philanthropy in the Baldwin branch of the family is that of the publicist's grandfather, William Henry Baldwin, who gave up a prosperous business to devote himself to the Young Men's Christian Union, an organization in Boston. And William Henry Baldwin, Jr., while serving as vice-president of the Southern Railway, became interested in the Negro's problem in the South. He became a stanch supporter of

Booker T. Washington, and from 1897 until his death in 1905 acted as a trustee of the Tuskegee Institute. It is significant, too, that the present William Henry Baldwin's mother is the daughter of Samuel Bowles, who, as the owner and editor of the Springfield (Massachusetts) *Republican*, worked for the abolition of slavery in pre-Civil War days. The Springfield *Republican*, the first daily newspaper in Massachusetts outside of Boston, was founded in 1824 by the publicist's great-grandfather, a descendant of a Boston pewterer.

When William Baldwin was born his father was general manager of the Flint and Pere Marquette Railroad, whose offices were in Saginaw, Michigan. Young William attended the Hackley School in Tarrytown, New York (1906-08), the Phillips Academy in Andover, Massachusetts (1909), and then entered Harvard University, the alma mater of his father. Completing his undergraduate work in three years, he spent the next at the University of Wisconsin, returning to Harvard to take his B.A. with his class, that of 1913.

Choosing a newspaper career, in which his maternal ancestors had won distinction, Baldwin became a reporter in the city room of the New York *Evening Post* in August 1914. In June 1917 he resigned from that paper to enlist in the United States Naval Reserve. From chief yeoman he rose to the rank of an ensign in October of 1917.

Receiving his discharge from the Navy in 1919, Baldwin joined the staff of the American International Corporation. In 1922 he assumed his first big task for the Negro cause by directing a campaign to raise a million dollars for Fisk University, the Negro institution in Nashville, Tennessee. Upon the completion of that undertaking Baldwin became the first executive secretary of the American Arbitration Association, which was organized in 1926 by Jules S. Bache, John D. Rockefeller, Jr., Charles M. Schwab, and other prominent men for settling disputes out of court. Not only has the association saved millions of dollars in lawyers' fees for its clients, but it also has expedited adjustments. Cases brought before the board often have had a hearing one hour later and a decision in another two hours.

In June 1926 Baldwin resigned from the association to establish his own public relations office. In 1942 the firm name was changed to Baldwin and Mermey. *Coronet* Magazine reports that Baldwin's most outstanding accomplishment as a publicist was his work on the reorganization of the drug firm McKesson and Robbins. "In accepting that job," says *Coronet*, "he met one of the most dramatic challenges of the day." The reorganization was the outcome of a Government investigation of the firm which had led to the arrest in December 1938 of its president, Frank D. Coster, on the charge of violation of the SEC act. Further investigation disclosed that Coster's real name was Musica and that he was a former convict. With his brothers, Musica had been leading a dual existence, dealing in arms concealed in drug shipments, and violating other laws. Before Federal authorities could conduct him to trial, he committed suicide. The scandal made nationwide headlines. Continuation of the Government's investigation of the case, and the many suits brought by stockholders of the drug company, kept the story in the news until 1941, while the business world believed that the firm could never survive the scandal. Much credit for the restoration of the firm's prestige and reorganization has been given to Baldwin and Mermey. The public relations firm also served in mobilizing public support for extension of the Reciprocal Trade Agreements Act in 1943 and again in 1945, and in counseling the National Association of Broadcasters in its fight with James C. Petrillo '40.

Bachrach

WILLIAM H. BALDWIN

Two of the welfare organizations with which Baldwin has been associated were "inherited" from his parents. In September 1910 his mother called a conference in New York (to which the family had moved after the appointment of Baldwin's father to the presidency of the Long Island Railroad Company) of representatives of the Committee for Improving the Industrial Conditions of Negroes in New York and the League for the Protection of Colored Women From this conference discussion of the urban social and economic conditions of the Negro sprang the National Urban League. Today the league has local affiliates in fifty-one cities throughout the country and more than two thousand active members of the Urban League boards and committees are attacking problems of employment, housing, health, recreation, education, and racial tension. The number of full-time employed staff members has risen to over three hundred. A sum of $100,000 expended by the national office in 1944 was supplemented by an additional $700,000 by local leagues. *Opportunity, Journal of Negro Life*, the league's official organ, completed its twenty-second year in 1944. The program of the organization outlines three goals: 1) Cooperation of welfare movements in an effort to apply to the Negro urban population the benefits of modern social service; 2) practical programs of amelioration of antisocial and destructive social and economic forces; 3) the training of Negro social workers so that they

BALDWIN, WILLIAM H.—*Continued*

themselves may not only accelerate social work among their own people, but pool their resources with those of white social workers for the good of society in general. It is stated in the league's 1944 annual report: "In the revulsion of public opinion against the disastrous race riots of 1943, hundreds of American communities organized official or unofficial committees to promote better race relations and public morale." Because of the geographical redistribution of Negroes to the North and the West, a movement which began after the First World War and has been accelerated since 1942, the problems of the Negro have become of greater National concern. The migrations have brought to light basic discriminations in the North and the West, for example, in the areas of employment and housing. These, in particular, "demand vigorous and constructive measures of national statesmanship."

Closely connected with the National Urban League since its beginning, young Baldwin became a member of its executive board in 1915. The following year he organized the Brooklyn Urban League, of which he subsequently became president, an office he held until 1927, except for his period of service in the Navy. In 1942 Baldwin became the president of the national body. Concerning the war effort of the thirteen million Negroes in the United States, Baldwin has said: "These millions of colored men and women are so thoroughly loyal that they not only seek but demand a real partnership in winning the war."

Baldwin was treasurer of the Committee of Fourteen, his inheritance in the way of civic work, when the organization went out of existence in 1932. (This group had succeeded the Committee of Fifteen which his father had headed but which was disbanded after he died in 1905.) The *Literary Digest* in 1932 reported that when the Committee of Fourteen "flamed into action against commercialized vice in 1905 . . . vice stalked, unafraid and unashamed." Much of the credit for vice suppression, the article stated, was due the committee. Later, however, the committee was to be criticized for incautious zeal which led to the arrest of innocent persons, a situation disclosed by the Seabury investigation of the thirties and by Raymond Moley '45 in his *Tribune of the People* (1933), a survey of the New York magistrate courts. "Unfortunately," said Baldwin, "there rose a public hysteria over the 'framing' of innocent women, and the impression developed in some quarters that the Committee of Fourteen either was a party to such methods, or was derelict in not having exposed them. In spite of all of this, however, the New York newspapers, upon learning all of the facts, re-established, with few reservations, their traditional confidence in the committee and its work." On its disbandment, because of lack of funds, the New York *Times* commented that the "single blemish" on the committee's record "should not outweigh the notable services it rendered this community [New York City] during the past quarter of a century."

In addition to serving as president of the National Urban League, Baldwin is a trustee of Fisk University; a director of Sydenham Hospital (New York), the country's first completely interracial hospital; a member of the finance committee of the Southern Education Foundation; treasurer of the American War-Community Services; director of the National Policy Committee. He has served as chairman of the National Association of Public Relations Counsel, as trustee of the New School for Social Research and of its Graduate Faculty, the "University in Exile." He is in 1945 in his third successive term as an elected member of the Board of Education at New Canaan, Connecticut, where he makes his home.

Baldwin has written *The Shopping Book* (1929), an aid to the housekeeper in judging and buying merchandise; and he contributed articles to the *Public Opinion Quarterly* during 1940, 1941, and 1944, and to the Harvard *Business Review* in 1942. His recreations are gardening and paddle tennis. Described as "faintly professorial in appearance," Baldwin wears glasses, has hazel eyes, brown hair, is five feet ten inches tall, and weighs one hundred and seventy pounds. In 1916 he was married to Cecilia Brewster. They have three children—William Henry, Walter Brewster, and George Lee.

BARBEY, DANIEL E(DWARD) Dec. 23, 1889- United States naval officer

Address: b. c/o Navy Department, Washington, D. C.; h. 2810 N. E. 24th Ave., Portland, Ore.

Hailed by newsman Frazier Hunt as "Uncle Dan, the amphibious man," Vice-Admiral Daniel E. Barbey is credited with the development of amphibious type of warfare. Inventor of the "duck," a dual-purpose boat on wheels, he answered during the war years 1943-45 to the title of commander of the United States Amphibious Force, Seventh Fleet. In that capacity he was, in the words of *Newsweek*, the "key man who made General Douglas MacArthur's '41 island-hopping possible." Three months after V-J Day, in mid-November, he was made commander of the Seventh Fleet, succeeding Admiral Thomas C. Kinkaid '44; and before the end of the year he was named commander of Atlantic Amphibious Forces.

Daniel Edward Barbey was born December 23, 1889 in Portland, Oregon, the son of John and Julia (Chlopeck) Barbey, and the grandson of Oregon pioneers. He was appointed to the Naval Academy from Oregon in 1908, and was commissioned an ensign in 1912. He saw service first in the armored cruiser *California*, from which he was transferred in July 1914 to the destroyer *Lawrence* as engineering officer; he assumed command of the vessel about April 1915 as an ensign. While serving as engineering officer of the gunboat *Annapolis,* 1916-17, he was awarded a letter of commendation by the Secretary of the Navy for services rendered in rescuing members of the crew of the grounded *Paddleford.* He was executive officer on the destroyer *Stevens,* when he was ordered to duty with the United States Naval Forces in Europe in December 1918. His first foreign duty was as naval port officer at Cardiff, Wales. Six months later he joined Naval Headquarters Staff in London. His next assignment was as aide on the staff of, and flag secretary to, and operations officer for, Rear Admiral Mark L. Bristol, commander of the United States Naval Forces in Turkish waters and High Commissioner to Turkey. Barbey was the American delegate on the Allied commission for control for trade with Turkey during his duty with Admiral Bristol.

During 1922-23 Barbey served as assistant engineer officer of the battleship *Oklahoma.* Then, after two years as officer in charge of the Navy Recruiting Station in his home town of Portland, he was married to Katharine Graham. Three years later, after serving as engineering officer of the cruiser *Cincinnati* and executive officer of the Navy oil tanker *Ramapo,* he was made aide and flag secretary to the Superintendent of the Naval Academy at Annapolis. He was also secretary to the Academic Board of the Naval Academy. In June 1931 he assumed command of the destroyer *Lea.* Two years later he was officer in charge of naval ordnance at the ammunition depot at Mare Island, California. In February 1935, a commander, he joined the battleship *New York* as damage control officer. In April a year later he was in the *Ramapo* again, this time as commanding officer. Then followed a period as commander of Destroyer Division No. 17, from June 1936 to 1937. He reported for duty at the end of that period to the Bureau of Navigation of the Navy Department, Washington, D. C., in charge of the War Plans Section. He was made captain during this period. In May 1940 he was in the *New York* again, as its commanding officer; and in January 1941 he became chief of staff and aide to Rear Admiral Randall Jacobs, commander of the Service Force and Amphibious Force, Atlantic Fleet.

Barbey was one of the few Navy men who possessed foresight about amphibious warfare. He became interested in it as early as 1937 when he was in charge of the War Plans Section, Bureau of Navigation, now known as Bureau of Naval Personnel. A small boat with a ramp used in the Sino-Japanese war had kindled his imagination. He studied pictures of it, and by late 1940 the Higgins boat, precursor of the craft technically called Landing Craft, Vehicle, Powered, but without a ramp, was being developed by the Navy. By that time, too, an amphibious force had been accepted as part of the Atlantic Fleet Service Force. In the summer of 1941, as chief of staff to Admiral Randall Jacobs, Barbey was ordered to organize a new amphibious force. With little information available, it was pioneering work. Barbey began by practicing amphibious maneuvers off the coast of North Carolina with fifty-foot, flat-bottom, front-door landing boats and "a little flock of lumbering, inefficient amphibious 'alligators.'" Then, named head of the Amphibious Warfare Section by Admiral Ernest J. King '42, he was given the job of organizing a workable unit "from scratch."

U. S. Navy
VICE-ADM. DANIEL E. BARBEY

Barbey had a difficult and untried task ahead: the problem of lifting an army—the troops and all the interrelated parts that make up an army—to the objective, then getting it ashore and through the initial battle. The command was then to pass to the regular ground force chiefs. In one word, the amphibious force was to be the "starter" for all invasions. The value of this force has been pointed up by the losses in other wars. "At Gallipoli," said Frazier Hunt, "brave Aussies and New Zealanders, sent ashore in ordinary ships and boats, had jumped the surf, struggled through barbed-wire entanglements hidden below the water, and in the end were mowed down by Turkish machine guns."

As the work of organizing this new amphibious force got under way, odd-looking designs began to appear on drafting boards and odd-looking contrivances then emerged. One was the Landing Ship, Dock. A "long, lean ship, it could hold numbers of small craft, loaded in turn with 'alligators', 'buffaloes', 'ducks', troop barges, tank carriers, and bulldozers. Arriving at the scene of action, the LSD would intake water, sink into the sea, open its back doors, release its load, and shuttle back for another."

Barbey's "duck"—his invention—made a dramatic debut in the National Capital. As the account was printed in *Newsweek*—"A strange mechanical contrivance that looked like the ill-conceived offspring of a motor vehicle and a seagoing barge rumbled through Washington streets from the Navy Department." Crossing the Potomac bridge, the story went, the object slid gently into a lake while a policeman waved his hands impotently on the sandy shore. As soon as the nameless thing hit dry land again

BARBEY, DANIEL E.—*Continued*

all the occupants were promptly arrested for invading a bird sanctuary.

Another part of the task confronting Barbey was the problem of how best to load and unload Liberty ships, freighters, and troopships, as well as his new landing craft. Unloading was a precarious business, and five days was then the best record for unloading a big supply ship. Barbey reduced this to five hours. Speed could not be overstressed in amphibious operations. While shuttling to and from beaches the big vessels were invitations to enemy torpedoes and dive bombers.

Today, landings are almost a guaranteed success. A preliminary concentration of naval fire batters enemy defenses; simultaneously, the air arm bombs rear positions to break up enemy communications. As the landing craft near the beaches and come within range of their own fire, that suddenly changes and rocket tubes fired from deck tubes on the landing craft blast a clear path the rest of the way. It is this last send-off that instills confidence, according to Barbey: "When the fellows in the boats see those rockets it gives them a lot of encouragement." Before the Philippine invasion Barbey, by that time a rear admiral, advanced the claim that the Army could force landings on any given beachhead with sufficient men and sufficient air and naval preparation and support.

Toward the end of 1942, in reply to MacArthur's plea for an amphibious force, Barbey (in December 1942 appointed a rear admiral) was sent to the Southwest Pacific. There in January he took over the command of the Amphibious Force of the Seventh Fleet. But he had to wait three months for the necessary parts. Then, early in April 1943 they began to arrive "in twos and threes—in tiny squadrons and flotillas," and they were manned by inexperienced men. Time and trained reserves had been too short to find any alternatives for them. But Barbey was loud in their praise. "They were wonderful," he declared. Those who were not, found out that Barbey liked "starch" in his discipline and did not follow the Navy custom of easing the washouts, gradually and gently, out of command. But he promoted good men as fast as he weeded out the inefficient ones, and the results brought in dividends in the way of fighters, tough and excellent.

For his action on Lae on September 4, 1943, and at Finschhafen on September 22, 1943, Barbey was awarded the Navy Cross, with the citation: "You personally led your force to the beachheads, and in the face of repeated enemy air attacks, you successfully launched and directed the . . . landings which . . . resulted in complete victory for our forces." He received the Distinguished Service Medal "for exceptionally meritorious service to the Government . . . as commander of the Amphibious Forces of the Seventh Fleet from January 8, 1943, to May 12, 1944. Skillfully building and developing an organization from men and material untried in battle . . . Rear Admiral Barbey contributed immeasurably to the success of the campaigns in New Britain, New Guinea, and the Admiralties." In June 1944, just before the Normandy invasion, Barbey was called back to Washington to give his views as an expert on the greatest landing ever planned. He was raised to vice-admiral.

Landing operations followed fast upon one another in 1945. After the Lingayen landing in early January, the largest of its kind yet made in the Pacific theater, Barbey's amphibious forces participated in the action at Subic Bay, Nasugbu, Bataan, Corregidor, Palawan Island, Lubang Island, Legaspi, Tawi Tawi, Masbate, and other points. In July Barbey took overall command of the initial attack on the rich oil center in Dutch Borneo, Balikpapan. It was reported in that month that more than a million men and one and a half million tons of cargo had been landed in fifty-six amphibious operations in the Southwest Pacific under Vice-Admiral Barbey's command. With the "tremendous naval power" at America's disposal, asserted Barbey at this time, it is possible "practically to clear out any beachhead so that troops can go ashore with comparatively few casualties." When Japan's surrender the following month made the contemplated invasion unnecessary, Barbey's Seventh Amphibious Force was assigned to land Army occupation troops in Korea.

But the scene of Barbey's command soon shifted. By the middle of November, when he had been put in command of the Seventh Fleet, the landing of Chinese Nationalist troops from United States transports had been effected under his supervision at several North China ports. This use of American ships and personnel was criticized by those who saw the United States action as interference in China's factional strife, although Barbey followed a plan designed to keep American troops from becoming directly involved in hostilities. The Vice-Admiral suggested, too, that Chinese and Japanese nationals be used for transporting Chinese troops and repatriating Japanese from the territory so that American naval personnel might be sent home. Toward this end and to effect Japanese surrender terms, United States naval men began the training of Chinese crews to operate amphibious vessels. As the ranking American officer in North China he urged the Chinese Nationalists and Communists to reconcile their differences lest Manchuria secede and establish an independent state. (Barbey was scheduled to leave this post in January 1946 to take command of Atlantic Amphibious Forces.)

The successes attributed to Barbey are measured in part by his Yankee ability to "make it do." At first he had to use all his powers of persuasion to obtain even a tiny amphibious force, or "spit-kit" outfit, in Navy vernacular. He generally had to borrow equipment from Admiral William Halsey '42. Until Arawe he had not a single cruiser for prelanding bombardment. "But you can't keep Uncle Dan down," said Hunt once. "Give him a cluster of cans, a handful of small fighting craft, and he will try to lift MacArthur's men half around the world."

Stocky, gray-haired Daniel E. Barbey is an affable person, but, man of action that he is, the Admiral has no patience with red tape. A young commander once called Barbey's attention to the fact that one of the operational orders was contrary to a certain fleet training bulletin. The young man was gruffly told by Barbey to forget it and go ahead.

"But, Admiral, it simply isn't according to Bulletin 167." "To hell with Bulletin 167," roared the Admiral. "It's no good—I wrote it myself when I didn't know a damned thing about it. I know better now."

In addition to the Navy Cross and the Distinguished Service Medal, he has won a Gold Star in lieu of a second Distinguished Service Medal for "exceptionally meritorious service" as commander of the Amphibious Force, Seventh Fleet, during the period from July 2, 1944, to February 1, 1945. He also received the Grand Order of Orange Nassau (Netherlands) by Royal Decree in March 1945, and the Legion of Merit from the commander in chief of the United States Atlantic Fleet for his services in the period 1941-42.

Barbey's campaign medals include the following: Nicaraguan Campaign Medal, U. S. S. *California,* 1912; Mexican Service Medal, U. S. S. *Lawrence,* 1914; Victory Medal, Transport Clasp, U. S. S. *Stevens,* 1918; American Defense Service Medal, Fleet Clasp, 1940-41; American Theater Campaign Medal, 1941-42; Asiatic Pacific Area Campaign Medal, 1942-43; and Philippine Liberation Medal, 1944-45. MacArthur holds Admiral Barbey in high esteem: "Just about the No. 1 amphibious commander of the world," was his pronouncement.

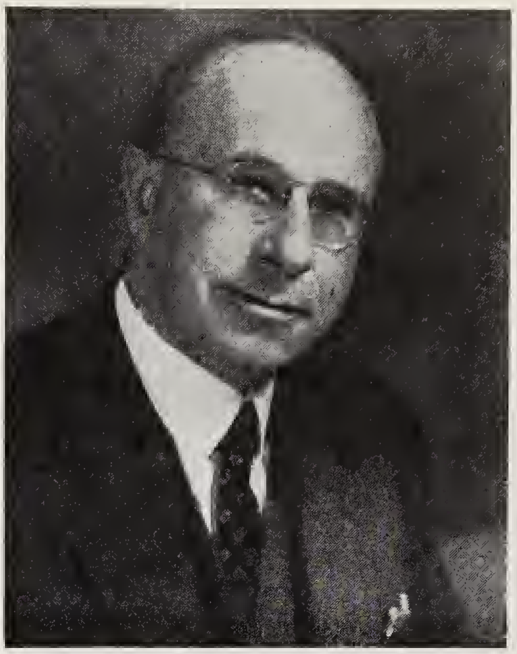
BARNARD, CHESTER I(RVING) Nov. 7, 1886- Corporation executive; USO official

Address: b. New Jersey Bell Telephone Co., 540 Broad St., Newark, N. J.; h. 333 Forest Rd., South Orange, N. J.

The president of the New Jersey Bell Telephone Company is Chester I. Barnard, chairman of the executive committee of the United Service Organizations, the wartime agency which provided recreational facilities for service personnel. As president of USO during the period of its greatest development (1942-45), he feels that it has work in the postwar years ahead in providing recreation for disabled servicemen in hospitals, and in assisting men and women in the service during the demobilization period. The USO will also provide a recreational outlet for American troops who must remain overseas for a time after the war.

The son of Charles H. and Mary E. (Putnam) Barnard, Chester Irving Barnard was born in Malden, Massachusetts, on November 7, 1886. He worked his way through Mt. Hermon, one of the Northfield (Massachusetts) schools, whose students supplement academic studies with a daily work program. With scholarship aid, he spent three years at Harvard University, leaving college in 1909 to seek work. His business career began with a clerk's position in the foreign language translation section of the statistical department of the American Telephone and Telegraph Company. Shortly afterward (1911) he was married to Grace F. Noera. (The Barnards have a daughter Frances, who is Mrs. C. Stuart Welch.)



Paul Parker Photo.
CHESTER I. BARNARD

During his early telephone career Barnard was sent to Europe by the American Telephone and Telegraph Company to make an exhaustive study of telephone practices there. In 1915 he became commercial engineer of the company, and in that capacity revised and developed the general commercial practices of the Bell system for greater efficiency. He became a recognized authority on telephone commercial practice and the economics of telephone rates, during the First World War serving as technical adviser on rates to the Rate Commission and Operating Board of the United States Telephone Administration. In 1922 he went to Pennsylvania as assistant vice-president and general manager of the Bell Telephone Company of Pennsylvania, and associated companies, becoming general manager of these companies in 1923, and vice-president in charge of operations in 1926, prior to going to New Jersey as president of the New Jersey Bell Telephone Company in 1927. This company was formed October 1, 1927, by merger of the New Jersey properties of the New York Telephone Company with the Delaware and Atlantic Telegraph Company, which operated in southern New Jersey.

Barnard has spent his entire business career in the telephone industry, although for a period he devoted all his time to the newly formed USO. Also, for many years he has participated actively in many civic affairs not connected with the telephone industry. In 1931, at the request of Governor Morgan F. Larson of New Jersey, he organized New Jersey's model Emergency Relief Administration and directed this organization for approximately two years; he served again in a reorganization

BARNARD, CHESTER I.—*Continued*

of the ERA in 1935. For a number of years he served as a member of the board of managers of the New Jersey Reformatory for Boys, and has been a member of the "Committee of One Hundred" sponsoring the National Boys' Club movement. He is also a national sponsor of Air Youth of America, and a member of a special committee appointed by the Secretary of Labor to study the problems of children.

Chester Barnard represented New Jersey, New York, Pennsylvania, and Delaware as a director of the United States Chamber of Commerce from 1931 to 1934; and he has served on a number of special committees of the Chamber of Commerce, one of which was the committee on defense and business welfare. In 1941 he was for a time an assistant to the Secretary of the Treasury on a special assignment. He is currently a member of the New Jersey State Chamber of Commerce and of the Chamber of Commerce of the State of New York.

The USO was organized before Barnard became its president. After the passing of the Selective Training and Service Act in Congress, social agencies felt that some provision should be made for recreational facilities for men and women in uniform. In October 1940 a group of people met to discuss this problem; these people represented six agencies—the Young Men's Christian Association, the Young Women's Christian Association, the National Catholic Community Service, the Salvation Army, the National Jewish Welfare Board, and the National Travelers Aid Association. These agencies represented the dominant American faiths, Protestant, Catholic, and Jewish. At this meeting it was decided that, in order to save duplication and waste, the six agencies would combine to form one large organization. (As the *Christian Science Monitor* expressed it, "'Let's do it together,' was the gist of that meeting.") Less than four months later, on February 4, 1941, the United Service Organizations for National Defense, as it was then called, was formed, and plans were made for approximately three hundred clubhouses for the armed forces, to be built with Federal money by the Federal Works Administration and operated with USO funds. When, in October 1941, it was found that no buildings had been erected, the project was transferred to the United States Army's construction division under Brigadier General Brehon Somervell '42, and work on the clubhouses was started immediately in the nine Army corps areas.

In 1942 Chester Barnard came into the USO picture when, on April 28, he was elected president of the United Service Organizations, Inc., to succeed Harper Sibley of Rochester, New York, who had resigned because of the pressure of private business. By this time USO had 692 units and was firmly established as a vital force in the war effort. As Barnard became president, a campaign for thirty-two million dollars to carry on its work was being launched. So great was the enthusiasm for USO that this campaign was oversubscribed; in fact, USO has always had a good response in its drives for funds. During the first two years of its existence it conducted its own money-raising campaigns, but in 1943 it became a member of the National War Fund, which unites the fund raising of many war-related philanthropies in one annual nationwide campaign. In April 1945, after three years as USO president, Barnard resigned from that office, to continue as chairman of its executive committee.

After 1942, when Barnard assumed leadership of the project, USO developed from an organization of less than seven hundred units to a network of almost three thousand operations (or units) serving the armed forces in the continental United States, two territories, three possessions, and fourteen overseas areas, with USO-Camp Shows entertaining wherever men and women in service were—in camp, hospital, or at the front. It has been estimated that thirty million service members each month enjoyed the services of USO. Of the total 2,723 operations, 1,473 were conducted by USO member agencies, 1,086 were community operated, and 164 were overseas units. Innovations after 1942 included preparations to receive both wounded and well servicemen at USO clubs; a marked increase in the Hawaiian Islands units; the organization of the National USO Council, composed of volunteers from each state and serving as an advisory group to guide changes in USO policies made necessary by the shifting course of the war; the establishment of regional offices in Boston, New York, Richmond, Atlanta, Chicago, Kansas City (Missouri), San Antonio, and San Francisco; and the introduction of a centralized accounting system.

USO clubs throughout the United States were specially constructed or remodeled buildings providing rooms for reading, writing, and lounging; halls for dancing and entertainments; Snack-Bars and other conveniences for servicemen and visiting wives and friends. Marcia Davenport '44, writing in the New York *Times Magazine,* described the USO club as a "fraternity house for a great fraternity" where, on any night of the week, one might see homesick boys writing letters, disabled soldiers learning handicrafts, or ambitious ones studying languages—and where, of course, Boy Meets Girl.

The USO Mobile Service, sometimes called a "Club-on-Wheels," served men at outpost stations and in maneuver areas. The Overseas Division of the USO was composed of clubs, lounges, and mobile units serving from Alaska to Newfoundland to Brazil, and from Hawaii to Bermuda; this division of the USO did not go outside American territory (the American Red Cross provided clubs for foreign areas), but USO-Camp Shows, working closely with the War Department, went wherever American troops were stationed, and the actors and concert artists shared the discomforts and dangers of the soldiers and sailors whom they entertained.

On February 4, 1945, this morale-building organization celebrated its fourth birthday with special three-day Open House festivities in clubs throughout the country, and a luncheon meeting attended by one thousand at the Waldorf-Astoria in New York City. At the New York meeting Major General Stephen G. Henry, Assistant Chief of Staff of the War Department, and Vice-Admiral Randall Jacobs '42, Chief of the Bureau of Personnel of the United States Navy, praised the work of the USO, particularly the entertainment of the USO-Camp

Shows, as being of "inestimable value" to the military success of the armed forces. Barnard also reported that one of the most difficult undertakings of the USO had been its wide service to Negroes and other colored races. "No matter what happens now," he said, "we have demonstrated that it is possible for us to perform a united service without relinquishing our special philosophy and points of view to make a total America. In the long run this accomplishment may be more important than anything we have done, for unity amid diversity is a fundamental problem of world peace."

The USO official is the author of *The Functions of the Executive* (1938) and numerous published addresses which he has made before university audiences and other groups. He is a trustee of the Northfield Schools and holds honorary degrees from Rutgers University in science, and from the University of Newark and Brown University in law. Barnard is a member of the advisory council to the department of politics at Princeton University and a Brackett Member (honorary) of the Princeton Engineering Association; a director of the Newark Institute of Arts and Sciences; and a member of the Newcomen Society of England. He was a member of the National Advisory Committee of the New York World's Fair in 1939; and late in 1945 he was appointed by President Truman '45 to a committee set up to coordinate Government medical services.

The telephone executive is a trustee and member of the executive committee of the Rockefeller Foundation; a Fellow of the American Academy of Arts and Sciences, and of the American Association for the Advancement of Science; a member of the American Philosophical Society; member-at-large of the Social Science Research Council; a director of the National Bureau of Economics Research, of the telephone company he heads, and of the Prudential Insurance Company of America, the American Insurance Company, and the Fidelity Union Trust Company, Newark, New Jersey.

Chester Barnard is a tall, well-built man who looks the part of the capable business executive. His hobby (aside from USO!) is music; he is a member of the Bach Society of New Jersey and the Newark Art Theatre, both of which he helped to found. His club memberships include the Essex Club at Harvard and the Harvard Club of New Jersey and New York, the Union League Club of New York, and the Harvard Faculty Club. In August 1944 Barnard received the Navy's Meritorius Civilian Service Award in recognition of outstanding service as senior civilian member of the Third Naval District Navy Manpower Survey Committee.

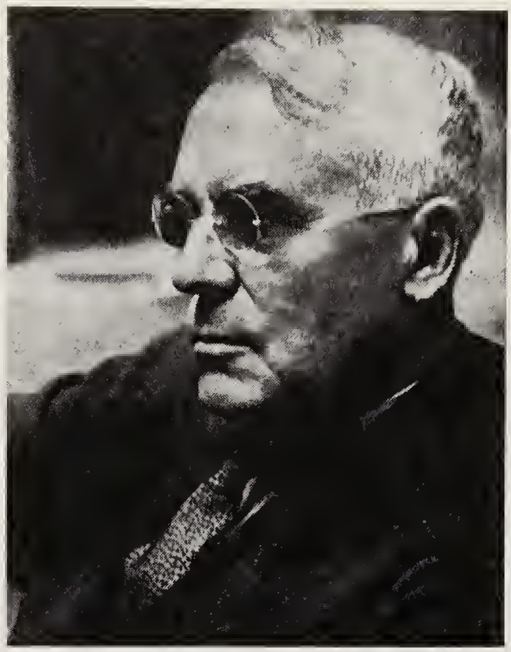
Who's Who in Commerce and Industry (1944)

BARNES, ALBERT C(OOMBS) 1872-

Art collector; educator; author

Address: Barnes Foundation, Merion, Pa.

The internationally known Philadelphian Albert C. Barnes is famous in the field of art by reason of his fabulously valuable collection of modern art, which he has dedicated to the advancement of the educational and cultural interests of America. A wealthy scientist-manufacturer, with an unerring sense of future values of the work of new artists, he began to collect their work in the early nineteen-hundreds, many years before they became recognized by others in the art world.



ALBERT C. BARNES

Albert Coombs Barnes, born in 1872 in Philadelphia, is of American colonial stock. His father, a veteran of the Civil War, had been a butcher. Brought up in South Philadelphia, the boy attended the public schools in that city. After being graduated from Central High School, by tutoring and playing semiprofessional baseball, he was able to earn enough to pay his way through the medical school of the University of Pennsylvania.

In 1892 Barnes received the degree of M.D., following which he spent a year as resident physician in an institution for the insane so that he might study abnormal psychology. Much of what he has achieved, Barnes says today, he owes to his knowledge of psychology. In his youth he became a disciple of William James—later of John Dewey '44, who extended the James principle of pragmatism. In 1894 Barnes went to Berlin to study physiological chemistry, and in 1899 he entered the University of Heidelberg. While he completed his studies there for a Doctor of Philosophy degree, he did not take it. His thesis, however, won him an offer from Dr. Paul Ehrlich, discoverer of the famous "606" treatment for syphilis, to work as his assistant. Barnes declined. For a number of years he had been thinking of the possibility of evolving a silver nitrate compound which would have strong antiseptic powers without the burning quality of the nitrate. Returning to America, the young scientist began his experiments, many of which, it is reported, were made on the kitchen range in the Brooklyn home of Laura Leggett, who became his wife in 1901.

BARNES, ALBERT C.—*Continued*

The result of his work, called Argyrol, was put on the market in 1902. Endorsed by leading physicians of the United States and Europe, the product was an immediate success. The income from the sale of Argyrol increased steadily; Barnes at thirty-five, it is said, was a millionaire. He never patented Argyrol nor his other product, Ovoferrin. Theoretically, any other manufacturer could make and sell the compound under another name; practically, this is impossible because the formula of Argyrol is Barnes's secret.

Barnes's interest in things artistic and cultural was no sudden development. He had done a good deal of painting in his youth. In his maturity he looked at his canvases critically and burned the lot. The Barnes Foundation (which he established in 1922) may be said almost to have started in the first decade of the century, with an enrollment of ten. These ten were his employees in the Argyrol factory. Barnes established a six-hour day for his employees, and held daily informal seminars from twelve-thirty until one-thirty. The class discussed William James, then went on to Dewey, Bertrand Russell '40, and Santayana '44. Barnes's first art purchases adorned the walls of the workroom, and the student-workers discussed these, too. Barnes set up a trust fund for his employees and even after the company was sold to the Zonite Products Corporation in 1929, the employees continued to draw an income, and will continue to do so as long as they live. (The Foundation is endowed by Barnes for ten million dollars.)

Barnes began buying pictures in the early nineteen-hundreds. As his business flourished and needed less and less of his attention, he became a full-time connoisseur, going twice a year to Europe to make his purchases. He was one of the first to recognize the genius of Cézanne, Renoir, Picasso '43, Matisse '43, Monet, and Degas. He decided that they had not been recognized because of "politics" and conservatism among art officialdom, and he spent twenty thousand dollars to acquire paintings of these artists. Studying them, he became convinced that they and not the conventional painters of the times carried on the tradition of the old masters. He worked hard at what had become his life work, applying to the collection the same energy and business sense that had resulted in the success of Argyrol.

Pictures now valued in the thousands and even the hundreds of thousands of dollars Barnes "picked up" in pawnshops, garrets, and cafes for the proverbial song. He became not only a collector but a promoter in the sense that when word got about among the French artists that Barnes was taking an interest in anyone's work, that artist was "made." A dealer who had sold a Van Gogh to Barnes for six hundred dollars found that the same painting was valued at ninety thousand, twenty years later. Barnes's first Picasso cost him twenty dollars, his first Matisse fifty. He is said to have paid less than one hundred dollars for an El Greco now probably worth fifty thousand. In time Barnes became famous as the owner of the largest and best collection of French nineteenth and twentieth century art in the world. He has not, however, limited himself to one field. He has a fine collection of the works of the old masters, considering them the ancestors of the moderns, whose cause he has espoused. And he is interested in sculpture (especially primitive Negro), furniture, and Pennsylvania handicrafts. Ker-Feal, a 177-year-old farmhouse, furnished in the period, is part of the Foundation.

For years the collector kept his acquisitions in the large house he and his wife occupied. Then, in 1921, Philadelphia became curious about modern art, and Barnes was asked to exhibit the paintings at the Pennsylvania Academy of Fine Arts, and did so. The public was aghast, and a group of alienists and psychologists pronounced the works the products of disordered minds. Barnes replied heatedly, and the next year announced his plans for the Barnes Foundation.

The gallery in which his famous twenty-million-dollar collection is housed is estimated to have cost Barnes a half million dollars. The walls of the twenty-six rooms are hung with pictures dating from 500 B.C. to the twentieth century. Barnes himself supervised their arrangement, works by moderns having been hung next to old masters so that the relationship in technique may be observed.

Barnes's idea was that the Foundation should offer free instruction in art to deserving students. At its inception he established a chair of modern art at the University of Pennsylvania and gave the students access to his gallery. Also, he announced his intention of leaving his art collection to the university. But the university officials hesitated at an association with the Foundation, with the result that Barnes "suspended" the university from further participation in his educational program.

From that time on the Barnes Foundation pursued its successful course. Its teachers, all of whom are graduates of the Foundation, select the students through personal interviews. There are now about two hundred students receiving free tuition in the art of understanding art, and there is always a waiting list of several hundred. Barnes bars sightseers—he says his students need peace and quiet. Some of the students are artists, some are studying to become art teachers in universities or colleges.

Barnes wants to teach his students an appreciation of art as related to life. Violette de Mazia, director of education at the Foundation, describes the institution as "a dream of John Dewey's—fifty years ago." (Dewey and Barnes have long been close friends. Dewey is adviser to the school, and his book, *Art as Experience*, was dedicated to Barnes.) "Stated in simple language," says Miss de Mazia, "the fundamental idea of our educational program is this: Art is not a phase of life apart from the workaday world to which one may turn in moments of leisure or perhaps in the name of so-called 'culture' or in a spirit of worship. In the Foundation's courses art is taken out of its usually detached, esoteric world and is linked up with life itself, because all the qualities which give painting its value are those which are found in various phases of everyday life, and art has value only because it expresses those qualities. In other words, 'art is a fragment of life presented to us enriched in feeling by means of the creative spirit of the artist.' We do not teach students how to paint, for that would be teaching a duck how to swim. We teach them how to learn to see; that is, to perceive the meanings in the events of everyday life, as well as in paintings, sculpture, music, furniture, objects in wrought-iron, trees, and flowers.

"We try to eradicate the almost universal, bad, confusing habit of looking at a painting for what it is not intended to be: information about subject matter, reminiscence, likeness to familiar objects, et cetera. We endeavor to create new habits of perception, that is, by observation of the component parts, the interrelationships of which determine the form of a painting. We study the artist's language, that is, how he uses light, line, color, masses, and space, and how at all periods of time his use of these means is an index of his reaction to his particular environment; in short, we study great traditions of past and present. . . .

"The aim of the Foundation is not to defend the work of any particular school or work of art," Miss de Mazia continues, "but to provide for impartial and objective study of the art expressions of all periods, and to show the continuity of the traditions of great art throughout its history. The inherent attributes of human nature have remained the same throughout the ages; and this implies that there is no essential difference between the great art of the past and the great art of the present. . . .Unless the student grasps the meaning of these principles, and thereby acquires a new set of habits, he never arrives at the gateway of individuality or personal expression, which is the only factor that makes a man a creative artist."

In the early days of the Foundation Barnes used to lecture. He gave up this practice several years ago, but still talks informally to groups of students almost daily. They particularly enjoy his reminiscences of artists and art dealers. Barnes would also take a group of the most promising students to Europe every summer. His running commentary on the pictures in the Louvre often turned into lectures which excited the admiring attention of other visitors to the gallery. John Dewey in the summer of 1926 went along as a student. The art collector had studied with Dewey; in his late forties he became a member of Dewey's classes at Columbia, attending regularly for three years. The philosopher has said that in a lifetime spent with scholars he has not met Barnes's equal for "sheer brain power."

Barnes is an author, too, having written *The Art in Painting* (1926), which reached three editions; and, in collaboration with Miss de Mazia, *The French Primitives and Their Forms From Their Origin to the End of the Fifteenth Century* (1931), *The Art of Henri Matisse* (1933), *The Art of Renoir* (1935). and *The Art of Cézanne* (1939). The gist of much of the criticism of these books is that they are able, exhaustive, and systematic studies of their subjects. To some reviewers, the analyses in the book are lucid and sound. Other reviewers found the volumes ponderous, didactic or dogmatic.

A number of articles have been written about Barnes as an educator and an individual. Among these was a *Saturday Evening Post* series (published in the spring of 1942) which displeased him not a little. "The model [for the articles]," declared Barnes, "is borrowed from Horatio Alger and adorned with the full and skillfully used bag of tricks of slick magazine reporting. . . . [The author] has constructed an elaborate series of fairy tales out of the record of my thirty years' efforts to advance the educational and cultural interests of America." (Other of Barnes's disagreements have been duly publicized, among them those with Alexander Woollcott '41 and Bertrand Russell.)

Albert Barnes is described as a man of good height, with a well-built, muscular body, gray hair, quick black eyes, ruddy complexion, and a firm jaw. "He looks more like an athletic coach than a student of aesthetics," it is said. In addition to his other interests, he is a thorough student of music (he played the violin in his youth) and an ardent admirer of Negro spirituals. He is an Officer of the Legion of Honor. Mrs. Barnes, "a gentle little person," is the director of the Foundation's courses in horticulture. The gardens of a twelve-acre aboretum are used as a laboratory for field study by the students. The Barnes live in an unpretentious home adjoining the gallery at Merion.

BENTON, WILLIAM (BURNETT) Apr. 1, 1900- United States Government official
Address: b. Department of State, Washington, D.C.; h. Southport, Conn.

Assistant Secretary of State in charge of public affairs is William Benton, appointed to this peacetime foreign information service of the United States by President Truman '45 in 1945. When the United States became a member of the United Nations Organization, Benton has stated, the American people chose a policy of active participation in world affairs and granted that security through understanding, rather than force, was the aim of America. "Yet the plain fact," continued Benton, "is that as we enter this crucial period of world history America is neither fairly nor fully understood by the peoples of other nations." Although he has had no experience in foreign relations, Benton is looked upon as one of "America's busiest and most practical educators" and a "peerless sales and press agent." After making his fortune in the advertising business he became vice-president of the University of Chicago, where his special tasks were the development of adult education by radio and the improvement of classroom instruction by motion pictures.

Born on April 1, 1900, in Minneapolis, William Burnett Benton is the son of Charles William and Elma Caroline (Hixson) Benton. The first American Benton settled in Connecticut in 1638. Later generations of the family have followed either the teaching profession or the ministry. William's father was on the faculty of the University of Minnesota for thirty-three years, and his mother, after serving as a student assistant of secondary education (1917-18) became an assistant instructor in the same department of Columbia University's Teachers College (1918-19). She was also the head mistress of a St. Louis girls' school. Before this, after the death of her husband in 1913, Mrs. Benton had taken her family to Montana where they lived during four years of homesteading (1913-17).

Young Benton received his preparatory education at the Shattuck (military) School, in Faribault, Minnesota, from which he was graduated in 1917. Both his father and grandfather had graduated from Yale, and at his mother's insistence young Benton took the examination for the Eastern university—but flunked. His subsequent attendance at Carleton College in Northfield in the same state (1917-18) was interrupted by the First World War, during which he served in the Student Army Training Corps at Yale. A campaign of study was then planned by Benton and his mother, which won his acceptance at Yale, and in 1921 a B.A. degree. Moreover, he had maintained an excellent scholastic record, served on the Yale *Record* as chairman of the board of editors, and was offered a Rhodes scholarship which he did not accept.

Benton's first effort in that direction was made with the National Cash Register Company—selling cash registers from the tail of a truck. Again his mother intervened, for family tradition demanded that young Benton follow a professional career. He agreed to enter law, but before reaching Harvard Law School he had secured a job as copywriter with Lord and Thomas and later with the George Batten advertising agency in New York. That was in 1922. In the next five years he attained the position of assistant manager of the Lord and Thomas agency in Chicago, and by 1929 that company was paying him twenty-five thousand dollars a year, a salary they offered to double when he announced he was resigning to open his own agency.

A few months before the 1929 stock market crash, Chester Bowles '43 and Benton formed the advertising agency of Benton and Bowles with a capital of eighteen thousand dollars. The first big account was Certo for General Foods Corporation. *Time* Magazine reports that the two young men increased their knowledge of the market value of this gelatin product by ringing doorbells for four months and asking housewives questions concerning it. This preliminary survey enabled them to launch an advertising campaign which proved so satisfactory to General Foods that the corporation turned over six additional food accounts to Benton and Bowles in 1932, and the firm became one of the leading advertising agencies. Among the first to use radio as an advertising medium, Benton and Bowles produced the Maxwell House *Showboat,* Palmolive *Beauty Box, Gang Busters,* and Fred Allen's '41 *Town Hall Tonight.* In 1935 Benton, who had been president of the firm, became board chairman. His share of annual gross billings of $18,000,000 was $250,000. A year later, when only thirty-six, he retired from the business world.

Shortly thereafter, relates *Film and Radio Discussion Guide,* his classmate Hutchins, who had become president of the University of Chicago, asked Benton to make a survey of some of the university's problems. The erstwhile advertising man became so interested in the work that he accepted an offer of vice-presidency in the university on the condition that he would have a substantial amount of free time for related and outside activities. In his special assignment for the university, the development of adult education by radio and the improvement of classroom instruction by motion pictures, William Benton was very successful. "One result of his interest in educational broadcasting," says *Discussion Guide,* was "the very marked enlargement of the *University of Chicago Round Table.*" He was also responsible for *The Human Adventure* program which is produced by the university's radio department with the assistance of the faculty. The New York *Times* radio critic, Jack Gould, has defined the goal of the program as "bridging the chasm that ordinarily exists between the complexity of the scientist's work and the comprehension of the layman." The weekly program is now in its sixth year. It won the 1944 Peabody prize and in the summer of 1945 became one of the few educational programs to get a regular sponsor on a network basis. In late 1945 the program dealt with radar, the atomic bomb, and Einstein's '41 theory of relativity.

When Sears, Roebuck and Company, which had acquired the *Encyclopædia Britannica* in 1920 when its owners went bankrupt, offered the publication to the University of Chicago in 1943 at Benton's suggestion, he agreed to provide the necessary working capital, to eliminate financial risk on the part of the university. (Today the university owns the preferred stock, Benton the common stock, and the university has options on his common stock at his death.) At the time of the transfer, Benton became board chairman of Britannica's United States, English, and Canadian companies. The publications issued by Encyclopædia Britannica, Inc., in addition to the encyclopedia, are *Britannica Year Book, Britannica Junior,* and *Britannica World Atlas.*

The only change of importance announced at that time was that the university faculty would become the official advisory staff of the publications, supervising the continuous revisions which the set of books undergoes. To insure "extreme vigilance in reading for revision, the Britannica company established fellowships at the University of Chicago. Fellows do the preliminary reading and make recommendations to faculty members, who in turn may recommend revision by experts." Among the group, besides Benton, who determined the policies of the Britannica project were Robert Hutchins, Henry R. Luce '41, president of Time, Inc., and Paul G. Hoffman, president of the Studebaker Corporation. Another change in Britannica under Benton was the purchasing of contemporary American art. Then it was planned to exhibit the paintings throughout the United States in order to focus nationwide attention on American art. Accordingly, the Encyclopædia Britannica Collection of Contemporary American Paintings (117 paintings) held its first exhibition on April 12, 1945, at the Art Institute of Chicago. This collection, reported *American Artist,* is only the beginning—each year new paintings by known and new artists will be added to the collection. A champion of audio-visual education, Benton also negotiated Britannica's purchase of Erpi Classroom Films and the acquisition by the university through a gift of the Eastman Teaching Films, which have since been combined under the name, Encyclopædia Britannica Films, Inc.

Rudolph H. Hoffmann

WILLIAM BENTON

The list of Benton's activities after retirement from business in 1936 continued to expand. He became vice-chairman of the non-profit organization, Committee for Economic Development, which he helped to found in 1942. (He was also chiefly responsible for proposing and stimulating the research side of C.E.D.) "In two years," stated *Fortune*'s October 1944 issue, "C.E.D. has expanded to embrace 50,000 business men. . . .Its research division employs top-flight economists to study policies bearing on reconversion and prosperity. Its field development division gets individual business men to plan their postwar production now, so reconversion strains will be minimized and business' own sights set for high employment."

In his capacity of vice-chairman of C.E.D., Benton, with Eric Johnston '43, made a trip to England in the summer of 1943 to study the possibility of "a friendly and profitable economic policy" between the two nations. Alarmed by the situation he found there, Benton, on his return to the United States, contributed articles on the subject to a number of leading magazines, including *Saturday Evening Post* and *Life.* He outlined five major areas of potential economic conflict between

BENTON, WILLIAM—*Continued*

the United States and Britain, namely, tariffs and other trade barriers, monetary stabilization, shipping policy, international aviation, and cartels. In fact, it was Benton's incisive comments on Anglo-American trade relations, reports *Business Week*, which drew attention to his qualifications for a post in the State Department.

In 1940 Benton gave his moral and financial support to Marshall Field '41 and others in setting up the paper *PM*. (His financial interest in the paper was disposed of shortly after its publication.) In 1938 he was made a trustee of the Shattuck School. He has acted on the Advisory Committee of the Office of Co-ordinator of Inter-American Affairs and as vice-chairman of the United States Commission of Inter-American Development Commission. He owns Associated Music Publishers, which holds the copyright on a high percentage of classical, chamber, and operatic music in America. It operates Muzak Transcriptions company which supplies music by wire to its subscribers. In 1938 Benton had a series of articles in the *Ladies' Home Journal* on education by radio, remedial reading instruction, and other related subjects in the field of education. Other articles by him on timely subjects have appeared in *Fortune, Reader's Digest, Life,* and the *Saturday Evening Post.*

After his appointment to Assistant Secretary of State in charge of public affairs, Benton resigned from his other positions. At his first press conference after assuming office (September 1945), his failure to say how he would discharge the heavy responsibilities of his new post disappointed newsmen. In addressing the New York *Herald Tribune* Forum on Current Problems in late October, however, Benton was more articulate regarding his plans. To remedy the fact that peoples of other lands do not know "the real America" (they regard us, says Benton, as either a "veritable Uncle Santa Claus" or an "Uncle Shylock"), radio, motion pictures, and information centers will be used as media of information. Referring to the *Voice of America*, a wartime Government radio broadcast which through thirty-eight shortwave transmitters operating in different parts of the globe broadcast news of the United States in forty languages, Benton said: "Today in the backwash of the war they [the *Voice of America* broadcasts] go out in eighteen languages . . . news untainted by special pleading or propaganda. . . .There should be Government information service abroad to strengthen America's voice." (For foreign service, the use of about four hundred information officers is contemplated.) As special assistant in his department, which at the time of his appointment was more or less in the embryonic stage, Benton has appointed John Howe, his former assistant at the University of Chicago. Among his consultants are Ralph McGill, editor of the Atlanta *Constitution*, Colonel John Hay Whitney '45, and Harold Lasswell.

Benton is an Episcopalian, a member of Zeta Psi, and of the clubs Fairfield Country and Pequot Yacht (Connecticut), Yale, University (New York), Chicago, Quadrangle (until 1945). In 1928 he was married to Helen Hemingway. The Bentons, who have a home in Southport, Connecticut, have four children, three of whom are adopted. They are Charles William, Helen Orr, Louise Hemingway, and John Hemingway. The half-smile Benton usually wears and "the whimsy that lurks in his eyes, bespeak the tolerance which happens to be one of his characteristics." Since assuming his State Department post he has worked twelve to fourteen hours a day.

BERGEN, EDGAR Feb. 16, 1903- Ventriloquist

Address: b. c/o National Broadcasting Co., Hollywood, Calif.; h. 9876 Beverly Grove Dr., Beverly Hills, Calif.

"The art of ventriloquism is merely that of cultivating a 'grunt,'" says the ventriloquist Edgar Bergen, whose perfected "grunt" is the voice of lively, impertinent Charlie McCarthy, one of the most popular entertainers on the screen and the air waves. In the course of the Bergen-McCarthy partnership, which began about 1920, two other figures have been admitted to the "family," but Charlie maintains a comfortable lead. In fact, he has a way of reminding his creator that even the Bergen fame and fortune are of his making.

America's most successful ventriloquist was born Edgar John Bergren, February 16, 1903, in Chicago, where his Swedish parents, John and Nellie (Swanson) Bergren, had a retail dairy business for a time. While the boy was still small they also lived on a farm near Decatur, Michigan; and when he was four he was taken on a visit to Sweden, where he learned to speak Swedish—hence Charlie McCarthy's fluency in that tongue. The family then returned to America, to live in Chicago again.

It was there that the eleven-year-old boy discovered quite by accident that he could do strange things with his voice. Quentin Reynolds '41 described the event in an article in *Collier's*: One day, when Edgar was standing on the porch of his home he called a greeting to a passing friend, who, instead of returning the greeting to Edgar, called to another boy standing on a porch three houses away from Edgar's. At school that afternoon the future ventriloquist pondered over the phenomenon. Then, on his way home he tested his newly found gift by hailing another boy, who exclaimed, "Who was that calling me, anyhow?" Edgar continued to practice his vocal tricks, progressing so well that "his mother was forever answering the door in response to pleas of mysterious old men who begged to be let in." Before long Edgar's interests had extended to sleight of hand tricks and he was spending his small savings on boxes of magic paraphernalia. One of his purchases was a twenty-five-cent book on ventriloquism, with which he set about developing his talent for "voice diffusion." And when the famous ventriloquist Harry Lester played in Chicago, writes Don Drury in *Coronet* (March 1945), Edgar often watched his performances. When the boy was about fifteen years old he impressed Lester so much that Lester gave him, without charge, almost daily lessons for three months in the fundamentals of ventriloquism.

Meanwhile, young Bergen went on to high school, attending the Lane Technical and Lakeview schools. It was then that Charlie McCarthy was born. The inspiration for the impish dummy was a tough Irish newsboy, and the head was carved in white pine by a carpenter named Theodore Mack, who followed young Bergen's specifications. In gratitude Bergen added a Celtic suffix to the carpenter's name—and Charlie McCarthy was christened. While Charlie's head cost thirty-five dollars, Bergen himself made the body. The newly whittled brash youth was an immediate success, delighting Bergen's classmates and teachers. The dummy, incidentally, helped his master pass an important history course by completely charming the teacher. He continued to assist Bergen financially at Northwestern University, where the latter's first courses were in premedical subjects: Bergen earned his college expenses by giving a combination magic-ventriloquism act at private parties. During Lyceum circuits. Bergen's college activities the summer he appeared on the Chautauqua and also included dramatics, for it was his first ambition to be an actor. On this point the ventriloquist now comments: "The nearest I ever came to that was to work for the Little Theatre in Decatur. I played the piano before the show and during the intermissions. And to make it more degrading, it was a player piano."

Presently Bergen abandoned both his premedical study and his thoughts about an acting career to enter vaudeville. With Charlie he rose from the small-time circuits to two-a-day engagements. His popularity continued to grow, and from 1926 to 1936 the two toured America and went abroad to perform in Iceland, England, Sweden, and Russia. In Sweden they appeared in musical comedy, in an act in *Rolfe's Revue*, and gave a command performance before the Crown Prince. Bergen also played in South America; once he performed at a colony of lepers in Venezuela, where Charlie used the international idiom of song before an audience confined behind an iron grating.

With the eclipse of vaudeville, in the early thirties, Bergen polished his routine for night clubs. He was very successful with an act called "The Operation," in which he played the doctor, Charlie the patient, with a nurse in attendance. This act was based on reality: Bergen had recently undergone an operation—he had argued with the doctors and experienced the usual qualms of a patient—all of which he transformed into a satirical comedy. Again he was a hit in European capitals and in New York, where he was engaged by the de luxe Rainbow Room in Rockefeller Center. One night in 1936, on the invitation of Elsa Maxwell '42, he performed at a party where one of the guests, Noel Coward '41, congratulated Bergen on his fine dialogue. A week later, on December 16, Bergen was on Rudy Vallée's radio program, for which he received one hundred and fifty dollars.

EDGAR BERGEN

That was the beginning of the radio career of Bergen and McCarthy. Instantly successful, they made frequent appearances on the Vallée show until Bergen signed a contract for his own program with Chase and Sanborn in May 1937. Since then he has received consistently high ratings in radio popularity polls. For two and one-half years he held first place. In December 1945, after eight years on the air, the Bergen-McCarthy team ranked fifth in the radio listeners' favor, as determined by the Hooper poll. The "magnificent splinter" has been joyously lampooning prominent personalities who appear as guests on the Bergen show. On one occasion he asked Orson Welles '41, "Why don't you release a blimp for active service?"; and at another time he referred to Emily Post '41 as a "vulture for culture." Such are the flippant verbal assaults, written by Bergen, which audacious Charlie expresses.

In the normal course of events Bergen and McCarthy went to Hollywood to engage in film work. (Before rising to radio stardom, Bergen had written and played in short films for Warner Brothers. Among these early shorts were *The Operation, Office Scandal, Donkey Business, The Eyes Have It, Free and Easy,* and *Africa Speaks English.*) In 1938 Bergen was featured in a two-million-dollar musical, *Goldwyn Follies.* That year he also appeared in Universal's *A Letter of Introduction.* Bergen received a special wooden "Oscar" from the Motion Picture Academy "for the outstanding comedy creation of 1938." The next year his ventriloquial talents were used in two more Universal pictures, *You Can't Cheat an Honest Man,* with W. C. Fields, and *Charlie McCarthy, Detective.* His next film was an RKO production, *Look Who's Laughing* (1941). In 1943 Bergen was one of the many stars in *Stage Door Canteen.* Reviewing this film, one writer

BERGEN, EDGAR—*Continued*

stated that when Bergen, "manipulates that fugitive from a picket fence, the show has great specialties." The next Bergen-McCarthy opus, in 1944, was *Song of the Open Road*, in which Charlie resumed an old feud with W. C. Fields. It was reported in October 1945 that Bergen, Charlie, and Mortimer Snerd would co-star in *Mickey and the Beanstalk,* a combined "live" action and animated cartoon feature, for Walt Disney '40.

With his radio and motion picture work, Bergen's finances have thrived. His sponsor in 1945 raised his weekly salary to ten thousand dollars, and he receives a hundred and fifty thousand for a motion picture. In addition, Charlie McCarthy toys, games, and jewelry, bring Bergen an annual seventy-five thousand dollars. In February 1945 *Variety* reported that Bergen's radio show was being offered to theaters for twenty-five thousand dollars a week, the "highest guaranty ever asked for a package show." Bergen's personal appearances have taken him into such de luxe spots as the Waldorf-Astoria Wedgewood Room. And other high places into which he will introduce Charlie are the Governors' mansions of the United States. The first of this series of broadcasts, which will run for two years, was held in Oklahoma in late 1945, when Governor Kerr of that state "guested."

Bergen maintains that the art of ventriloquisim cannot be taught since it is largely a matter of the structure of the vocal processes. His interest in his art is also scholarly—he wrote the *Encyclopedia Britannica* article on the subject. Explaining its history and technique one time in an interview, he said: "The word 'ventriloquism' comes from combining two Latin words, *'venter,'* meaning stomach, and *'loquor,'* meaning speak. Literally it is speaking from the stomach, instead of from the throat. It is a very old art, too. . . .The labials are the tough letters to get out without moving your lower lip. Letters like *m* and *p*, I mean. What I do is to make my tongue take the place of my lower lip in pronouncing labials. My tongue and the roof of my mouth really are substituted for my lips." Bergen does vocal exercises to sustain the ventriloquial quality, practicing high notes to keep Charlie's voice distinct from his own, which is naturally soft and fairly deep. Originating his own material, Bergen is considered one of the best comedy script writers in the business. In 1942 he was invited to lecture at the University of California on the subject of comedy writing. His originality was given wider scope when he added Mortimer Snerd, the yokel, to his "cast," and in 1944 he introduced the latest addition to his dummy family in the ample personage of Miss Effie Klinker. Bergen had been wary of feminine dummies since an eight-year-old wooden girl failed to please the public many years before. But Effie was the result of a Bergen performance on an NBC show for which he had no dummy and resorted to a falsetto voice he called "Ophelia." At the time he suddenly realized that "women can get into many more situations than men, particularly a bachelor maid." Hence the advent of Effie Klinker, a "ventrilowitch" of New England background and "spry libido."

In 1942 Bergen toured Army camps in Alaska with Charlie and Mortimer Snerd. The trio were a hit with the soldiers, who especially appreciated Charlie's military antics. The comedian returned impressed with the importance of entertainment in the war. In 1943 Bergen was again on tour, this time to Army and Navy bases in Newfoundland. For the trip he carried a racy two-reeler titled *The World's Greatest Lover and How I Became That Way*, starring Charlie McCarthy. Bergen filmed this vehicle himself, using the homes of Hollywood stars as background. He has long been an avid photography fan, and in his years of camera work has produced travelogues and newsreels. The entertainer's next tour, in 1944, covered Army and Navy hospitals. Bergen has also established a foundation for the training of student nurses, claiming he has been a "thwarted Dr. Kildare" since the days of his premedical work at Northwestern.

Bergen is considered as having done an excellent job in maintaining the pretense of Charlie McCarthy's individuality. Charlie's dominant personality, described as "saucy, lethally precocious, and irreverent," makes radio fans forget that he is of solid wood. Bergen keeps Charlie's age at fourteen, but Charlie's prodigious precocity often amazes his master. Sixty per cent of the voluminous Bergen-McCarthy mail is for the wooden charmer. Charlie has his own stationery inscribed with his motto: *E Pluribus Mow 'Em Downus.*

The lively fellow is manipulated by Bergen through a backflap in the figure. It is Bergen's view that "illusion is the mother of ventriloquism," and to many people Charlie is a strong illusion. Even at the radio studio his co-workers find it difficult to remember that Charlie is a dummy. Before Bergen takes his friend from his case Charlie is heard screaming profanely for release. Don Ameche, who has long worked with Bergen on the radio program, remarks, "I always have the feeling that he is a definite, living personality." Characterized by a New York *Times* writer as "a little vulgarian, a brassy, blustering, sniggering blockhead," Charlie McCarthy is nevertheless a favorite of the ladies, known as the "Casanova of Hollywood." The ogling "timber wolf" has played romantic scenes with some of filmdom's loveliest feminine stars, most often with Dorothy Lamour—"Dotty" to him.

Edgar Bergen is unlike the character he has created. He has said that Charlie's personality "is as opposite from mine as it can be, and I envy him. . . .To me it's quite remarkable that this carved piece of wood . . . should be so important. He can be invited to the White House, consulted by OWI, received by the royalty of Europe. . . .It's ridiculous, even, that my appearing any place without Charlie is a complete failure. I do think it's a case of the tail wags the dog." Bergen is really a shy, gentle man of meticulous habits and simple tastes, and is described as straightforward and nimble-witted. He is slender, five feet ten inches tall, weighing one hundred and forty pounds. He has blue-gray eyes and his receding blond hair occasions many a snide remark from Charlie. Charlie himself is thirty-eight inches tall and weighs forty pounds—a brown-eyed redhead whose top hat and tails cannot conceal the urchin heart.

In November 1945 it was revealed that Bergen had been married nearly five months. Frances Westerman, a Powers '45 model known as Frances Westcott, had become his wife in a ceremony in Mexico on June 28. The ventriloquist collects rare antiques, and for reading prefers serious music and books. He also enjoys tennis, riding, and working in his shop, where he turns out gadgets like his Electrical Ant Trap and keeps Charlie in fighting trim. (The Charlie of today, according to Drury, came from the workshop of Frank Marshall in Chicago.) Charlie lives regally in his own room, complete with well-filled closets and a private bath. His admirers will be glad to learn he has a stand-in for dangerous movie scenes and that he is insured for five thousand dollars and is provided for in Bergen's will. When he travels, his compartment is a plush-lined trunk.

Bergen is a member of the Screen Actors Guild, the Society of American Magicians, Delta Upsilon fraternity, and the Lambs club. Among Charlie McCarthy's honors is his appointment as first International Fire Chief. Bergen's alter ego also served as mayor of San Francisco for a day. In 1937 Northwestern University conferred an honorary degree on him, the degree of Master of Innuendo and Snappy Comeback. The citation, presented by Dean Dennis of the university's School of Speech, read: "Prince of Parasites, violent in company, churlish in behavior, acid in conversation, wooden-faced in all relationships, and thus is in many respects a typical product of higher education in America." In 1944, when Bergen was decorated by King Gustav V '42 of Sweden with the Order of Vasa, First Class, for furthering American-Scandinavian relations, he immediately ordered a miniature of the decoration for his woodcrafty colleague.

BERNADOTTE, FOLKE, COUNT (bĕr″ nȧ″dôt′ fôl-kĕ) Jan. 2, 1895- Swedish diplomat

Address: h. Dragongården, Djurgården, Stockholm

In the kaleidoscopic days before the actual surrender of Germany to the Allies the first week of May 1945, Count Folke Bernadotte played a brief, spectacular role as intermediary between Heinrich Himmler '41 and Great Britain and the United States, in what was the Nazis' most definite bid for peace up to that time. During the war years the Count, who is a nephew of King Gustav V of Sweden '42, had been known primarily as vice-chairman of the Swedish Red Cross and the man who had arranged for the exchange of thousands of war prisoners.

COUNT FOLKE BERNADOTTE

Oddly enough, kindness to war prisoners was instrumental in placing the first king of the Bernadotte dynasty on the throne of Sweden. In the course of his career as one of Napoleon's marshals, Jean Baptiste Jules Bernadotte (later governor of Hanover and Rome and Prince of Ponte Corvo), had shown leniency to Swedish war prisoners and had become friendly with Swedish officers. His resultant popularity in Sweden led, in 1810, to his election by the Riksdag as crown prince of Sweden, and in 1818 he succeeded, as Charles XIV, the childless Charles XIII.

Folke Bernadotte, Count of Wisborg (a title conferred upon his father by the Grand Duke of Luxembourg in 1892), was born in Stockholm on January 2, 1895. His father, of the fifth generation of the Bernadotte house, is Prince Oscar Carl August, second son of King Oscar II and brother of the present King. Prince Oscar renounced his rights to the throne when he was married to Ebba Henriette Munck of Fulkila, a lady of noble but nonroyal blood. Folke's boyhood was spent in Ostermalm, a section of modern Stockholm. The home life of Prince and Princess Bernadotte was characterized by a religious spirit; Biblical stories rather than fairy tales were told to young Folke, who is the second son and youngest of five children. An article written by Mac Lindahl for the *American Swedish Monthly* relates that during morning prayers he and his elder brother were not always able to maintain a fittingly solemn demeanor. The rebuke of the Prince, who for fifty years has acted as head of the Swedish YMCA, was characteristic of him: "Have a good time," he would say, "before we start being really serious."

This early religious emphasis at home brought Folke high grades in Bible study at school; English, too, was a study in which he excelled. After his early education was completed, he was entered at the officers' military school of Karlberg, the Swedish West Point. He did well in his studies there, graduating tenth in his class, and was next enrolled at the military riding school at Strömsholm. His excellent horsemanship won

BERNADOTTE, FOLKE, COUNT—*Cont.*

for him several prizes and trophies, and today he is a cavalry officer of the Royal Guards.

Count Bernadotte became known to Americans in 1928, when he was married to Estelle Romaine Manville, daughter of the late H. Edward Manville, former board chairman and president of the Johns-Manville Corporation, one of the largest asbestos concerns in the United States. The Count's introduction to the American heiress took place on the French Riviera, at a dinner given in honor of his royal uncle. "A toy balloon," relates Joachim Joesten '42, "came down near Miss Manville, who was seated next to Bernadotte, and exploded." They both laughed and from then on their acquaintance quickly developed into a romance, which led to their betrothal about two weeks later. "Pretty fast work," commented an American reporter when the Count arrived in America for the wedding, which took place on December 1, 1928. "You've got to work fast to get the best girl in the United States," quipped Bernadotte in reply.

Since his marriage Bernadotte has been a good-will ambassador to the United States on a number of occasions. In 1933 he represented his country at the Chicago Century of Progress exposition; during the New York World's Fair in 1939-40 he acted as commissioner general of the Swedish Pavilion, where he was often seen dining with his Countess. In his native land the Count is board chairman of *Det Bästa*, the Swedish edition of the *Reader's Digest*. During the Second World War he has served as head of an organization similar to the American USO; and it was due to his initiative as president of Sveriges Scoutförbund, or the Boy Scouts, that this youth group was closely linked with Sweden's defensive measures. The Scouts took an active part in the antiaircraft service of their country, and they were also trained as medical assistants.

Bernadotte's most significant war service, however, has been his work as vice-chairman of the Swedish Red Cross. In this capacity he has aided in the exchange of disabled German and British war prisoners, a service described by Britain's Foreign Minister Anthony Eden '40 as "a major humanitarian effort." The first exchange under his supervision took place by way of Sweden in October 1943. After that it was necessary for the Count to make frequent air trips to the capitals of the two belligerent countries. On one such mission he was caught in Berlin in the first heavy Allied raid over the city, in November 1943. In the course of the bombing all four of the Swedish Legation buildings were destroyed.

Early in 1945 Bernadotte arranged for the transfer of Danish and Norwegian political prisoners, held in several German camps, to a single camp operated under the supervision of the Swedish YMCA. It was while he was occupied with this work that he came into contact with Heinrich Himmler, the German commander in chief of the home front. In the opinion of Mac Lindahl, these meetings probably caused Himmler to think of the Swede in the role of an intermediary when several months later the Germans were to seek an armistice with the Allies.

While working with the Red Cross in Germany, Bernadotte had been staying in the Swedish Legation's temporary headquarters in Friedrichsruh, near Hamburg. One day in April 1945, when all the world was anxiously awaiting signs of Germany's surrender, the Count received word that Himmler wished to see him. Hitler '42, the message said, was dying from a cerebral hemorrhage, and Himmler was therefore in the position of full authority. According to a release from the United States Department of State, the meeting arranged between Himmler and Bernadotte took place at one o'clock on the morning of April 24, in Lübeck in North Germany. The Gestapo chief proposed complete German surrender to Great Britain and the United States, with the condition that Germany be allowed to continue the resistance to the Russian armies in the East. When Bernadotte specifically asked whether the German troops in Norway and Denmark would be included in the capitulation, Himmler promised that these would also surrender, to the Americans, British, or Swedes.

With these terms, Bernadotte flew to Stockholm's Foreign Office, which, without revealing the peace emissary's name, relayed them to the British and American Ministers in Sweden. These representatives in turn notified Prime Minister Churchill '42 and President Truman '45. According to the story as it was later revealed, Truman went to the Pentagon Building in Washington on the afternoon of April 25 to hold a conference with Secretary of War Stimson '40, Acting Secretary of State Grew '41, General Marshall '40, and Admirals King '42 and Leahy '41. Transatlantic telephone conversations with Churchill resulted in the agreement to notify Stalin '42 of the Himmler offer and the British-American decision to accept only unconditional surrender to the three Allied Governments on all fronts. The next day the Swedish Foreign Office was informed, and on April 27 peace courier Bernadotte took off from Stockholm for Flensburg, Germany, just below the Danish border, to acquaint Himmler with the Allied rejection of his terms.

Up till April 28 no news of the closely guarded secret had leaked out, but on that day, a Saturday, news of the peace offer broke in all three Allied countries. The Moscow radio announced that the Tass agency had been authorized to state that reports of Himmler's offer had been confirmed in responsible Soviet quarters. Downing Street, while refusing either to confirm or deny the news, declared that the Allies would accept peace overtures only if they were made to all three Governments. That evening Senator Tom Connally '41, head of the Senate Foreign Relations Committee and delegate at the San Francisco conference, announced to an Associated Press reporter that Germany had surrendered unconditionally, with "no strings attached," after the United States and Great Britain had rejected a two-way surrender. Within a few minutes the A.P. had the scoop on the air, and a wave of celebration swept the excited country before the story could be denied. The Nazi-controlled Danish Radio, meanwhile, admitted that Bernadotte had been conferring with Reich officials. Later the American State Department announced that after the Swedish emissary had delivered the Allied Governments' reply, Himmler, refusing to accept it, had made no further offers.

It was not until April 30 that the world learned that Count Folke Bernadotte had been the unnamed individual who had relayed to the Allies the Himmler overtures for peace. Adding further drama to Bernadotte's errand was the report that he had narrowly escaped death when Allied planes bombed the Danish airfield from which he was about to take off on April 28. The Count, his chauffeur, and a companion had been forced to jump into a ditch for safety from Allied machine-gun fire.

Bernadotte returned to Stockholm on May 1, the day Grand Admiral Karl Doenitz '42 announced the death of Hitler and his own succession as Führer. The Count's statement that he had not seen Himmler led the Swedish press to assume that Bernadotte had conducted peace negotiations with Doenitz, although the Admiral had announced that the war would continue, and the Swedish Foreign Office had stated that the Count had brought no message for the Allies. It was revealed, however, that he had arranged for the release of some fifteen thousand Norwegians and Danes, and of women of various other nationalities, from Nazi internment camps. Then, seven days later, on May 8, the world heard the official announcements that the unconditional surrender of the Germans to all the Allies was at last an actual fact.

Bernadotte's own account of his meetings with Himmler and other leaders of the Third Reich during the critical period from the middle of February to the end of May was published in Stockholm early in the summer. In October a translation of the Count's book was published in the United States under the title of *The Curtain Falls*. (It has also been translated into other European languages, and is to appear in Hebrew and Esperanto.) J. Raymond Walsh called it "a good little book, and George Harriss judged it "interesting not alone for the information it contains on negotiations and events, but for its picture of a nightmarish world." The book was considered valuable, too, for its portraits and glimpses of Nazi notables.

A New York *Times* dispatch on October 21 revealed that plans evolved by the Count and the Swedish YMCA for the revival of the YMCA in the American and British zones of Germany had been approved in principle by General Eisenhower '42. Thus the program to replace the Hitler Youth by the YMCA may be in action by 1946. In an interview on November 20, the day of the opening of the Nuremberg war crimes trial, Bernadotte expressed his views on that subject. C. L. Sulzberger '44, New York *Times* correspondent, reported that while Bernadotte "agreed in principle with the theory of designating war criminals, he did not believe that high-ranking officers . . . should be tried if they were merely doing their duty and following military commands. Count Bernadotte said, however, that if an officer had violated the Hague Conventions, perhaps he could be classified as a criminal and that the officer should have considered risking death for mutiny rather than obey such orders as those calling for the shooting of prisoners."

In the summer of 1945 the Count was honored for his Red Cross work: Norway awarded him the Grand Cross of the Order of St. Olav, and the Universities of Copenhagen and Uppsala gave him honorary Doctor's degrees. Later, a book containing the names of seven thousand men and women saved from Nazi concentration camps by the Swedish Red Cross was presented to him; and in November he was made a Commander of the French Legion of Honor. In November also he was appointed president of the Swedish Red Cross, to take office January 1, 1946. He succeeded his father, Prince Carl, who had been president since 1906.

Eh-ma-do-ye-na, or "He who is worshipped by everybody," is Bernadotte's honorary American Indian title. As this name suggests, the Count is considered a good diplomat, known for his integrity and his friendliness. Tall and handsome, he has smiling gray-blue eyes and a long, lean face. In his dress, he is partial to fedoras, and almost always wears a boutonniere on the lapel of his double-breasted suits. He is fond of horses, and likes bicycling—even in the prewar days of gasoline plenty he was seen every weekday morning peddling his way through the Stockholm streets to his office. With their two sons, the Count and Countess live in a park-like section of Stockholm not far from the Strand, one of the main streets of the city.

BIDAULT, GEORGES (bē-dō zhôrzh) 1899(?)- French Government official

Address: b. French Foreign Office, Quai d'Orsay, Paris

In the five years between the outbreak of the Second World War and September 1944 Georges Bidault had risen from the position of a history professor, who had never held a political office, to the rank of Foreign Minister of France, the second highest public office

GEORGES BIDAULT

in his country. After one year in office, Bidault was not only world known as a diplomat but had seen his party, the Mouvement Républicain Populaire or MRP, a moderately progressive group of which he is the leader, emerge from the October 1945 elections as one of France's strongest political parties. Although the Communists desired the important Cabinet post of Foreign Minister, De Gaulle '40 refused to replace Bidault, who was re-appointed to the post on November 22. "It took the imagination of history itself," declares Ernest O. Hauser, "to create this extraordinary character"—professor, editor, underground leader, and government official. In the last capacity he led the delegation that represented France at the United Nations Conference on World Organization, at San Francisco, in the spring of 1945.

Born about 1899 in Moulins, France, Georges Bidault is the son of middle-class parents. His father was a director of an insurance company in central France. After the death of his wife, when the boy was only two, the senior Bidault became so austere that the home life was "without much warmth or fun." At ten Georges was sent to a French Jesuit school in northern Italy, where he remained until he was sixteen. While there he was known as a brilliant scholar who preferred reading the classics and history to participating in sports, and even at that age it was felt that he would become a man of moment. His gift for leadership was displayed after he was elected president of the Catholic Youth Movement. Before he was drafted for service in the First World War at the age of eighteen, young Bidault had enrolled at the Sorbonne, to which university he returned after serving briefly with the French Army of Occupation in the Ruhr in 1919. Graduated with highest honors from the Sorbonne from which he received the degree of *agrégé,* Bidault began his teaching career as a professor of history at a lycée in Valenciennes. In his early thirties he was appointed to the Lycée Louis-le-Grand, France's most distinguished secondary school.

Establishing his bachelor home in the Latin Quarter of Paris, where the school was located, Bidault took up his professorial duties. In addition, he became foreign editor and columnist for the Catholic daily, *l'Aube.* In 1932 (an election year) he and a few young members of the Popular Democratic Party had founded this paper, "on a shoestring." The Popular Democrats, reports *Free France,* at that time were a group of Leftist Catholics who, despite their small representation in the Chamber of Deputies, had a strong appeal among young middle-class Catholics and Catholic workers throughout France. When the Popular Democrats joined the Popular Front in 1936 Bidault withdrew. He vigorously declared his opposition to the Munich pact and other prewar appeasement policies.

Bidault's daily column on foreign affairs in *l'Aube* (1932-39) made him somewhat of a national oracle. Although the circulation of the newspaper, described by him as "small but honest," never exceeded twenty thousand, and while he never enjoyed the popularity of a syndicated Walter Lippmann '40, he nevertheless left his impact upon the political thinking of the French intelligentsia. He never became a partisan politician either, and his only political activity was an unsuccessful try for the Chamber of Deputies in 1935. The main point of his editorials was that "national power and unity spring from a higher power and a deeper loyalty than mere party allegiance."

Ernest Hauser reports in the *Saturday Evening Post* that an examination of the issues of *l'Aube* during Bidault's column-writing days reveals the sanity and consistency of his views even in those pacifist prewar days. At the time of the Ethiopian crisis of 1935 Bidault wrote, "If Geneva allows aggression in Africa, what authority will she command to stop aggression in Europe?" The Austrian *Anschluss* to him was "a great misfortune from a viewpoint of civilization and peace." Franco's '42 Spanish rebellion was sharply criticized by the Catholic Bidault as "a pretense of saving Christian civilization and law and order with methods that violated both." In Hauser's opinion, the French editor's most brilliant series of articles were those written in condemnation of the appeasement policy toward Hitler's '42 Germany.

With the outbreak of the Second World War the life of the middle-aged editor and professor of history underwent a radical change. One day he was in the uniform of a sergeant in the French Army, and the next he was behind the barbed wire of a German prison camp. In 1941 he was free again, having been released with others of his age group and returned to France. He immediately enlisted with the underground, thereby beginning a precarious double life that was to last for two years. During the day he held a teaching post in Lyon in unoccupied France, and at night carried on the work of resistance. Thrice weekly he published the twenty-page underground *Bulletin de la France combattante,* and he also acted as liaison agent between the Resistance of Continental France and the Fighting France Headquarters in London. (His sister and two brothers worked for the underground also.)

Arrested in 1943, he succeeded in escaping and that year collaborated with a mysterious person known only as "Max," who had been smuggled into France with orders from General de Gaulle '40 to formulate into one group the three chief anti-Nazi groups (political parties, labor unions, and resistance groups). Max succeeded in uniting Communists and Catholics, aristocrats and proletarians, and also in creating the National Council of Resistance, an underground "government" which consisted of seventeen members. When the unoccupied zone was overrun by the Germans this council moved to Paris. In the summer of 1943 Max was arrested by the Gestapo, and Bidault, a member of the council, was chosen to succeed him as president. During the entire period of the ex-professor's leadership, says Hauser, not a single incident occurred which prompted any one of the divergent groups fighting under the Cross of Lorraine to threaten to secede from the council.

On his assumption of the highest but the most dangerous post in the underground, "Monsieur le professeur ceased to exist." In a pathetically simple disguise—a hat (something he had never worn before) and a mustache were added, eyeglasses removed—Bidault miraculously escaped recognition. The weekly meetings of the council (limited to five members at a time to escape detection) were held in different apartments, or sometimes in a publishing house or a doctor's office, but never twice in the same place. "The professor who had removed his spectacles knew how to elude the Gestapo." His dangerous job demanded that he give up all pretense of "pedantic regularity" to the life of the hunted. He lived on the Left Bank in a tiny bedroom intended for the maid in the apartment of a middle-class family. No one except "Fred," his secretary, ever came to see him. In the spring of 1944, however, despite all precautions, the Gestapo learned that Georges Bidault was the leader of the underground. From that time on "the bloodhounds were breathing down the professor's neck—but they never caught up with him." When asked later whether he had carried the customary death pill during his hunted days, Bidault, who is a devout Catholic, replied, "As a Christian, I reject suicide. The Lord preserved me."

Immediately after the liberation of Paris De Gaulle's Provisional Government was moved from Algiers to the French capital. On September 9, following several days of reshuffling and new appointments, the General announced his reorganized Cabinet. Eight of the original Algiers ministry were missing, and in their places were members of the Resistance. One of these was Georges Bidault, who succeeded René Massigli as Foreign Minister (or Commissioner). Alexander Uhl of *PM* commented, however, that the ratio of four Socialists and two Communists to fifteen members from other parties did not reflect the true political state of France, which he felt to be more to the Left.

Recognition of the Government by the Big Three nations, rumored at first to have been postponed until after a national election, came some six weeks after the formation of the Cabinet. On the afternoon of October 23 the Ambassadors of the United States, Great Britain, Russia, and Canada presented themselves at the Foreign Ministry in the historic Quai d'Orsay to hand Bidault similar notes from their respective countries. Bidault, speaking with emotion, declared that France would enter, with her head high, the concert of great nations.

The next month the diplomatic triumphs continued for the new foreign minister. France was invited to become the fourth of the great-power members of the European Advisory Commission, which had been organized for the purpose of studying certain European questions. On November 21, in his first speech to the Consultative Assembly, Bidault announced his forthcoming visit to Moscow. He made it clear that France intended to maintain close relations with Russia and that she strongly disapproved of an exclusive bloc of nations in Western Europe. "France wants an alliance in the West and an alliance in the East," he said, adding that France would never agree to "belong only to the West." (After the United Nations conference "had approved of regional agreements as useful elements for the collaboration of peoples," Bidault came out in support of a Western European bloc, saying that he simply demanded for France "the right to do as others already have done.")

This visit of De Gaulle and Bidault to Russia resulted in a Franco-Soviet pact of alliance and mutual assistance. The first agreement made by the De Gaulle Government, it was signed in Moscow by Bidault and the General on December 10, 1944. The Paris press unanimously expressed satisfaction, calling it the starting point of an international organization and not the creation of a bloc excluding other alliances. Edgar Ansel Mowrer '41, New York *Post* columnist, welcomed the treaty, commenting that it prevented the zoning of Europe, which he considered "a divide-and-bully theory." Moreover, the dividing of Europe into an Eastern and Western zone, in the opinion of Mowrer, would place Germany in a pivotal position so that in the future she might play one against the other.

French representatives had not been asked to attend the Yalta conference of Churchill '42, Stalin '42, and Roosevelt '42 in February 1945, nor the Dumbarton Oaks security conference the preceding year. The French Foreign Office had at first expressed the Government's unwillingness to accept plans which it had had no part in formulating, but on February 12, before the publication of the final Yalta communique, the Provisional Government was officially informed of the results of the conference. The French Government was also asked to state its views on the conference declaration. Then, on February 20, Bidault, speaking before the Foreign Affairs Commission of the Consultative Assembly, stated that it was the Government's intention to cooperate to the fullest in the creation of an international system that would guarantee French and, consequently, European security. At the end of the month, on an invitation from Great Britain, Bidault visited London to discuss with Churchill and Anthony Eden '40 various matters of mutual concern. He had also signed an economic agreement with Belgium, Luxembourg, and the Netherlands, which the following October was renewed for another six months. The new agreement tripled commercial exchanges between the countries.

Bidault's views on a world organization follow closely those of another deeply religious man, another professor turned statesman, Woodrow Wilson, who desired a league in which all the nations of the world would be politically equal. Bidault has declared: "I do not believe in a five-power directorate for the affairs of Europe or the world. . . .There can be no prospect of wholehearted cooperation for peace unless a universal system is set up in which the smaller nations as well as the big powers are made to shoulder responsibilities in proportion to their means and power." His views on postwar terms for Germany also reflect those of Wilson, who said at the end of the First World War that the Allies must be just even to those to whom they did not wish to be. The Second World War statesman said in November of 1944, in an exclusive interview with the New York *Times*, "The peace with Germany should not be one of vengeance; it must be just and human. Germany will have to be controlled for years to come, but I am not for trying to make her harmless by dismembering her artificially." Bidault's statement that France did not want to incorporate any German territory nor want any German minority within her borders showed wisdom, commented the *Christian Science Monitor.*

Well in advance of the United Nations Conference on International Organization at San Francisco, France had stated her definition of security. At that time she said, "Above all, leave France, Russia, and any other powers allied in regional treaties against postwar Germany free to act without waiting the approval of the world organization. Abolish the right of veto now reserved to each of the Security Council's big-power members (including France). Give the world organization's parliament of nations, the General Assembly, some authority over the Security Council, which the Big Three would put completely beyond the Assembly's control." This attitude, in the opinion of *Time* Magazine, amounted to a bald declaration of "no confidence" in the Big Three design for peace. In short, France doubted that the "Big Three were big enough to run Europe and the world." On the other hand, General de Gaulle personally edited a statement which assured that France did not wish to wreck Dumbarton Oaks if nothing better were achieved, but that France "would be ready on her part to go even farther than Dumbarton Oaks and consent to greater limitation on her sovereignty in exchange for a more effective international organization than that proposed by this plan."

Foreign Minister Bidault, according to *Newsweek*, was responsible for having cleared the diplomatic atmosphere, and obtained De Gaulle's consent to send representatives to the San Francisco conference. Subsequently, however, France refused the invitation of Great Britain, Russia, and the United States to join them as sponsors of the conference. "In his quiet way," commented the magazine, "Bidault has followed the General in all his diplomatic forays, picking up the pieces." When the French delegation first arrived at the conference it seemed as though the Government's refusal to act as a sponsor would handicap it in taking its place among big powers, but during the second week France joined their ranks. "Slowly but surely," reported Edwin L. James in the New York *Times,* "the French came to be invited to the meetings of the original inviting powers, and now the Big Four has definitely turned into the Big Five."

As head of his delegation, wrote the New York *Herald Tribune,* Bidault seemed resolved to "express the power and the stature of his country by reasonableness and French good sense rather than by oratory or impressive demands." According to Elsa Maxwell '43, he "completely captivated newsmen at his press conference [in early May] with his quiet way of talking, his head cocked sideways a bit, his quizzical smile. . . .He answered all questions swiftly," Miss Maxwell continued. "I felt, and so did others, that he was clever, but completely trustworthy . . . intelligent and honest."

In mid-May, as the situation in Syria and Lebanon became increasingly difficult, Bidault was forced to leave the conference, and Paul-Boncour '45 succeeded him. It was said that the Foreign Minister had considered resigning in protest against De Gaulle's policies in sending, in his absence, "more French troops to occupy the Val d'Aosta in Italy without the authorization of the Allies." In early July it was announced that the French Government would give Syria and Lebanon full sovereignty over their own armies, and in December both Great Britain and France formally agreed to withdraw their troops simultaneously from the two regions and to consult jointly on all Middle Eastern questions.

Despite the fact that France had been included in Big Power conferences at San Francisco, she was not invited to the Potsdam meeting of Russia, Great Britain, and the United States after Germany's surrender. The decisions taken at the meeting, in which France was asked to concur, were sent to the Foreign Ministry. France criticized these agreements, saying that they set up a new distribution of power, with the Soviet Union gaining the most. Sixteen days later Bidault and De Gaulle signed the ratification of the United Nations Charter. Shortly afterward the Minister accompanied the General to Washington to ask help from the United States in the reconversion period.

Subsequently, Bidault attended the London conference of the Council of Foreign Ministers, which had been set up by the Potsdam agreement to consider peace treaties with Italy and former satellites of Nazi Germany. After growing tension, the Big Five reached a deadlock on the Balkan question. The bone of contention, it was pointed out, was Russia's demand that all except the Big Three be excluded from drafting peace treaties with the Balkan nations. (Bidault, during the conference, succeeded in establishing an understanding between Italy and France.) "Despite the serious setbacks at London, we French," said Bidault, "do not despair of finding a formula for an accord among the Big Five. France and the United States both hope to see the creation of a permanent international organization." In referring to "Western bloc politics," the statesman said, "If people talk about the 'West' in connection with France, it is because geographically France belongs to the West, but she is equally in the world."

One of the surprises of the October 1945 French national election was the strength of Bidault's party, the Mouvement Républicain Populaire. This new party, organized in Algiers during the war, not only won 138 seats in the National Assembly, which placed it among the big three of France's political parties (the Communists elected 152 members and the Socialists 151 members), but also overwhelming approval at the polls on two questions of a referendum that they had supported. Their victory (shared with the Socialists) on these questions, the framing of a new constitution and the giving of more power to the Constituent Assembly, greatly increased the party's prestige.

The platform of MRP, reported the *Christian Science Monitor* at the time of the election, is "very similar to that of the Socialists, except that it is more vague and general in all planks. It is Roman Catholic of liberal trend. On only one issue does it split with the Socialists. . . . The Socialists are opposed to allowing any schools in France to be run by religious groups." Although the MRP approved of such schools in their party platform, Bidault, in a speech before his party in November, stated that the party would on no occasion make it an issue that could interfere with national coalition. His own description of the party of which he is the acknowledged spiritual head is, that in American terms, it "is the equivalent of New Dealism in the economic field." In his speech on MRP's willingness to form a coalition government with the Communists and Socialists, he said, however, that "the movement would refuse to be bound by the economic and political doctrines drawn up by the Delegation of the Left." Bidault's elaboration of the stand his party would take, commented the New York *Times,* was received with much interest because his views are said to be very close to those of De Gaulle. Concerning the nationalization called for by the National Council of Resistance, the statesman declared, "The method of nationalization is a matter of discussion and detailed work which we will not shirk. The MRP does not promise to any one that this or that industry will be nationalized within a given time. But we do promise to expedite the expropriation of private monopolies so that a more equitable regime can come into being, not only in distribution of profit but in division of authority."

Edgar Mowrer (New York *Post*) was of the opinion that the election results had justified the foreign policy of De Gaulle, now President, and Bidault. While seeking to remain "a bridge between the Soviets and the Western powers, France, if compelled to choose, will remain a Western power." The new Government, composed of twenty-two members, provided, in accordance with the wishes of the Constituent Assembly, for equal representation of the three main parties, with six of the ministries filled by lesser party groups and independents. Bidault remained in his post as Foreign Minister.

With the surrender of Germany, France had been given a share in the Allied administration of the occupied country. Her subsequent refusal to consent to the centralization of certain aspects of German economic life until Germany's western boundaries were determined, became the subject of strong criticism. According to Bidault, France feared the recreation of a German Reich. In December American Secretary of State James F. Byrnes '41 intimated that the Big Three might disregard the unanimity rule of the Allied Control Council in complying with the Potsdam pledge on unification. When it was announced that same month that the Foreign Ministers of Great Britain, the United States, and Russia would soon meet in Moscow, presumably to discuss the problem of Germany, Bidault was not asked to attend the meeting.

Bidault's accomplishments as a statesman have won for him acclaim from widely different sources. "The ablest French foreign minister I've ever dealt with," said Anthony Eden. He is different and much better than the traditional French minister, said a correspondent from *Free World* after an interview. "He has brought to the Government a new spirit, or even a new ideal, namely revolutionary Christianity or a dynamic Christian world order," commented the *Christian Science Monitor.*

In December 1945 Bidault was married to his assistant, Mlle. Suzanne Borel, France's only woman career diplomat. The Foreign Minister is short and slight, and has dark hair that is now graying and a striking face—"almost round, but unusually strong. It gives him a deceptive appearance of youthful robustness and sturdiness." His hobby studies are stamps and mushrooms, and he likes good wine, good food, and green apples. Although the duties of his office are arduous, Bidault says that he prefers making history to his former job of teaching it.

BLAIK, EARL H(ENRY) (blāk) Feb. 15, 1897- Football coach

Address: United States Military Academy, West Point, N. Y.

In December 1944, while American men in khaki faced the most formidable foe in all history, the West Point Cadets fought the most brilliant football game of their seventy-five football seasons against the best pigskin galaxy the Naval Academy had ever produced. Army's unbeaten "Black Knights" did it again in 1945. Only five years earlier football at West Point was in the doldrums, the team having been pulverized in 1940 by practically every squad it contested. Today Army is "the pride and joy of every heart in gray." The man credited with this resurrection is "metronomic drill-devil" Colonel Earl ("Red") Blaik, head coach at West Point since January 1941.

COL. EARL H. BLAIK

In three seasons from 1943 through 1945 his West Pointers won twenty-five games, tied one, and lost two, a record comparable to Tennessee's fabulous 27-2-1 record from 1929 to 1931. In 1944 and 1945 Blaik's boys ran up a winning streak of eighteen games, a total of 916 points and 135 touchdowns to their opponents' combined 81 points and 12 touchdowns. "It is nice to have such backs as Doc Blanchard and Glenn Davis and such linemen as Coulter, Green, etc.," commented Stanley Woodward, "but it takes a real job of handling to keep a winning team on its toes through a long season, to bring it up to full playing form each week, to give it enough poise to stand prosperity."

Earl Henry Blaik was born in Detroit, Michigan, February 15, 1897, the son of William Douglas and Margaret Jane Blaik. Graduating with a B. A. degree from Miami University at Oxford, Ohio, during the First World War, and entertaining thoughts of entering the war as an officer, Blaik secured an appointment to West Point. After completing the first two-year course in the Academy's history, he was graduated in 1920. Of his aptitude in sports Willis MacDonald, Blaik's barracksmate at West Point, has said: "Blaik was a good end. He made Army's kicking game go because he was very fast downfield under kicks. He was a deadly tackler and an unusually keen defensive player. As a football, basketball, and baseball player, he won the Army saber as the best athlete in his class." Although not very proficient in all phases of mathematics, Blaik was graduated from the Academy in the first third of his class.

Upon graduation Blaik was appointed a second lieutenant in the Cavalry of the Regular Army. Promoted to first lieutenant a month later, he was sent as a student officer to the Cavalry School at Fort Riley, Kansas, the following September, and in June 1921 he reported at Fort Bliss, Texas, for duty with the Eighth Cavalry. Less than a year later, discouraged by the Army policy of slow peacetime promotions, the young lieutenant resigned in March 1922. Several days after having submitted his resignation he received a letter from Douglas MacArthur offering him a post greatly coveted by any young Army officer—that of personal aide to the General, who was about to leave for the Philippines. It is said that had Blaik received this appointment prior to his resignation from the Army he would undoubtedly have accepted the assignment.

From 1923 to 1934 Blaik joined his father in the building firm of W. D. and E. H. Blaik in Dayton, Ohio. The contracting business apparently did not absorb his whole attention, and with the passing of each year his longing for the gridiron grew. In the fall of 1926, taking time off, Blaik went to the University of Wisconsin to coach the ends and backs for a few months under George Little, who had been Red Blaik's coach at Miami in 1916. The next year Blaik worked for several weeks at West Point with Biff Jones, the Army coach, training more backs and ends. By 1929 Blaik's business had proved itself lucrative enough for him to devote more time to football.

In 1934, after serving as a part-time coach at West Point for seven years, he accepted the position of head coach at Dartmouth to try to rejuvenate a team whose only major victory the preceding season had been its defeat of Pennsylvania State College. Confident that the Indians could regain their high standing in the pigskin world, Red Blaik said, "We're going to bring home the bacon." His high hopes, however, were soon shattered. The herculean task of breaking in veterans to a new coaching regime resulted in a 7-2 defeat by Yale and a 21-6 "shellacking" by Cornell in the anticlimactic Cornell-Dartmouth encounter. Of that Blaik has recently stated, "That was the worst nightmare I've ever lived. That night I needed no more than a gentle shove to steer me over those Cayuga cliffs." But by 1936 Blaik had produced a team that was almost invulnerable to scalpings. His record at Dartmouth reveals forty-five wins, fifteen losses, and four ties. Blaik's men won the mythical Ivy League Hat in 1936 and 1937, and tied Cornell for it in 1938. The Indians, now "a precisioned rock-and-sock team," were once again on the warpath.

In November 1940 Army suffered the most humiliating defeat in the history of Cadet football, when Penn State routed West Point by a 48-0 score. The new Superintendent of the Academy, Major General Robert L. Eichelberger ['43], aware of the anomalous situation present in the existence of a poor Army team when the country was in the process of setting up the largest and most powerful army of all time, asked Red Blaik to consider Army before signing another Dartmouth contract, implying that it was Blaik's moral obligation to come to the rescue. Blaik, extremely happy with his work and environment at Dartmouth, was slow in accepting the offer. Finally, after much deliberation, he submitted his resignation at Dartmouth, saying that "in this national emergency I want to do something. . . . If I can make some small contribution toward our preparedness, I'm gratified. I'll say this, leaving Dartmouth was the hardest decision I've ever had to make."

Shortly after Blaik's arrival at West Point the United States entered the Second World War. The feeling arose among many Americans that what they called a "schoolboy's luxury" should be suspended for the duration of the war. Military and naval leaders asserted, however, that football inculcated into players a sense of strategy, leadership, teamwork, discipline, individual initiative, a will to win. The game was described as more analogous to warfare than any other. And since the start of the war Army and Navy authorities have continually requested more of "those football players."

Red Blaik was the first civilian coach West Point had had since 1911, when the Academy introduced the system of filling the post with an Army man. However, in December 1942 Blaik was back in the Army when he was commissioned a lieutenant colonel. Blaik's assignment at West Point was described as the toughest coaching job in the country. Intimate with the life and routine at West Point because of his past associations with it, Blaik was able to launch a sound rehabilitation program for Army football. "Our biggest job," said Blaik, "is to breed confidence into this squad. We must also blend the innate 'Kaydet' rigidity with the mental and physical elasticity with which the college player is better blessed."

In 1942 when Notre Dame substituted the T-formation for its own Rockne system, Blaik was slated for gridiron laurels, although completely unaware of it at the time. (The "T" is "an intricate system of cross-blocking and blind-angle blocking on the secondary, which produces devastating results when all the applicants carry out their assignments.") In order to set up defenses for this new formation, Blaik labored over its peculiarities. The more he studied it, the more impressed he became; and when finally certain of its potentialities, he scrapped the single-wing alignment, in which he had become recognized as a master, for the "T" plan. Red Blaik became enthusiastic about the modernized "T," "with its men-in-motion, flankers, and single blocks." Critics were dubious of the success of Blaik's switch and suggested he stick to something he knew. However, with the passing of each season, the record began to dispel the critics' doubts. Army was on the road to complete recovery. Each year the number of games that were won increased, and the games lost decreased.

In the 1944 season the Cadets had an all-winning season, inflicting a crushing 59-0 defeat on Notre Dame and a 62-7 one on Penn, avenging their gridiron defeats of 1942, when they were routed 13-0 and 19-0 by Notre Dame and Penn, respectively, and of 1943 when they were mauled 26-0 by Notre Dame. Ed McKeever '45, acting coach of Notre Dame, in commenting on the 59-0 rout inflicted by Army, said: "At least we got out of the game alive. We got it and got it good, but I think anyone who knows football knows we got it from a great team."

In December 1944 football fans were excited over the coming annual gridiron battle between the Cadets and their traditional foes, the Navy. There was a great deal of speculation as to the outcome of this game. Sport critics advertised Navy's mighty line, while they also extolled Army's speedy backs and the theoretical superiority of the T-formation. The game, in the previous two years staged in the semi-privacy of West Point and Annapolis, was given a metropolitan setting in Baltimore as a feature of the Treasury Department's Sixth War Bond Drive. To preclude any additional train traffic, the entire Cadet corps of twenty-three hundred men, with officers and instructors, traveled to Baltimore on a War Department troopship. Among the gridiron spectators were such notables as General George C. Marshall '40, Army Chief of Staff; Admiral William D. Leahy '41, Chief of Staff to the President; Admiral Ernest J. King '42, Commander in Chief of the Navy; General Henry H. Arnold '42, Chief of the Army Air Forces; and Admiral Jonas H. Ingram, Commander of the Atlantic Fleet. The game was relayed to the most advanced posts in the far-flung battlefields of the world so that twelve million other Americans could tune in.

Uncertain in attack in the early phases of the game, the Cadets unleashed their flashing T-formation in the fourth period and established their supremacy beyond doubt in the most discussed game in the history of this rivalry. Critics, formerly skeptical of Blaik's version of the "T," admitted that "it represents the highest perfection it has ever attained." Commander Oscar Hagberg, head coach at Annapolis, said: "Army simply gave us hell." Grantland Rice '41 wrote: "This is undoubtedly the best all-round Army team, ably coached in the "T" attack, that West Point has ever seen." Blaik, in very high spirits over the success of his team, said that he "couldn't single out any man. Everybody on the squad did a magnificent job."

Blaik's backfield was a powerhouse, with such figures as Felix Blanchard, "a fullback prize," Doug Kenna, "the 'T' quarterback of the war," and Glenn Davis, "the fastest back." Herman Hickman, Army's line coach, who had received All-American distinction as a guard at Tennessee, was responsible for producing a sturdy and rugged line that battered Navy's forwards. Blaik was voted into second place in 1944 and 1945 by college and football service coaches in the New York *World-Telegram*'s annual poll to determine the favorite coaches in the United States. His Cadets were selected as the best football team in the collegiate world by one hundred and twenty-one sports writers, and for the first time they were awarded the Lambert trophy as the top eleven in the East.

Blaik's 1945 team was even more impressive. Blanchard and Glenn Davis were the two most talked-about players of the season, even appearing jointly on *Time*'s cover as "Men of the Week," and other Army football names like DeWitt Coulter became familiar to the sports public. West Point won every game of a crowded season against all types of defense. "Any coach who has the misfortune to face the West Pointers," said one such unfortunate, "is utterly helpless. If he jams up the middle alley to check Blanchard, Davis murders him with his sweeps. If he spreads his defense to halt Davis, Blanchard pulverizes him on the outside with the charge of an angry water buffalo.

(Continued next page)

BLAIK, EARL—*Continued*

And if by some stroke of genius he can distribute his strength evenly enough to bother them both, Army passes him dizzy." On various occasions, moreover, Blaik gave his second team, and even his third and fourth-stringers, a chance to "play a little football, and toughen the fiber of their morale. . . .The way Blaik let the kids stay in there and find themselves" on one such occasion, wrote Joe Cummiskey, "the way they finally did stiffen and take the ball away on downs in the shadow of their own goal posts, actually seemed to afford Blaik more pleasure than the breakaway runs of his stars."

With a 32-13 score against Navy's hitherto unbeaten eleven to conclude the season, the West Point team was again named the top collegiate team by the country's sports writers, again awarded the Lambert trophy, and of its members, six were selected for the All-Eastern college team, five for the All-American. Also, one of the team, Doc Blanchard, won the Heisman Memorial Trophy as the Nation's outstanding football player. Recognized as one of the great football teams of all time, Blaik's team was to be augmented in the 1946 season by the two stars of Lou Little's '45 1945 Columbia Lions, Cadets-elect Lou Kusserow and Gene Rossides.

With Earl Blaik's promotion to colonel, the leaf has been displaced by a new silver eagle on each shoulder, "but nary a chip on either." Tall and thin, he has a personality which rallies the friendship of all his players. Although a "human dynamo" on the gridiron, with his "strict hours, pounding work, and meticulous timing," he also possesses a great deal of "Blaik the human" in realizing "that all work makes Jack a dull football player." The new master of the gridiron coaching craft is a member of the fraternities Beta Theta Pi and Tau Kappa Alpha. In 1924 he was married to Merle McDowell, his childhood sweetheart. Their elder son William, a hockey player with no football ambitions, was in 1945 at Dartmouth, "brushing up on his math" in preparation for entering the Military Academy in the summer of 1946. The Blaiks' other child, Robert, finished out the 1945 season as quarterback for the Highland Falls High School team, although a broken collarbone had put him out of the line-up for a month.

BOHR, NIELS (HENRIK DAVID) (bōr nēls) Oct. 7, 1885- Danish physicist
Address: b. c/o University of Copenhagen, Copenhagen

It has been pointed out that seldom do the scientists responsible for the elucidation of science's seeming enigmas play a large role in the technical application of their discoveries or theories. Thus, while the available data about Nobel Prize winner Niels Bohr, whose name has been connected with the atomic bomb, suggests that his part in the actual production of the bomb was small, the history of modern theoretical atomic physics begins, according to many scientists, with Bohr's atomic theory of 1913 and has been influenced by his leadership throughout the succeeding years.

Niels Henrik David Bohr was born October 7, 1885, in Copenhagen, Denmark, one of the sons of Christian Bohr, professor of physiology at the University of Copenhagen, and Ellen (Adler) Bohr. In 1903 Bohr entered the same university in preparation for a career in physics. By 1907 he had distinguished himself sufficiently to receive the gold medal of the Royal Danish Academy of Science. Two years later he received his degree of Master of Science in physics. And in 1911 the doctorate, for which he had investigated the electron theory of metals, was conferred upon him. Leaving Copenhagen, Bohr then crossed the North Sea to enter world-famous Cavendish Laboratory at Cambridge University, at that time directed by Sir Joseph J. Thomson, who discovered the electron nature of cathode rays.

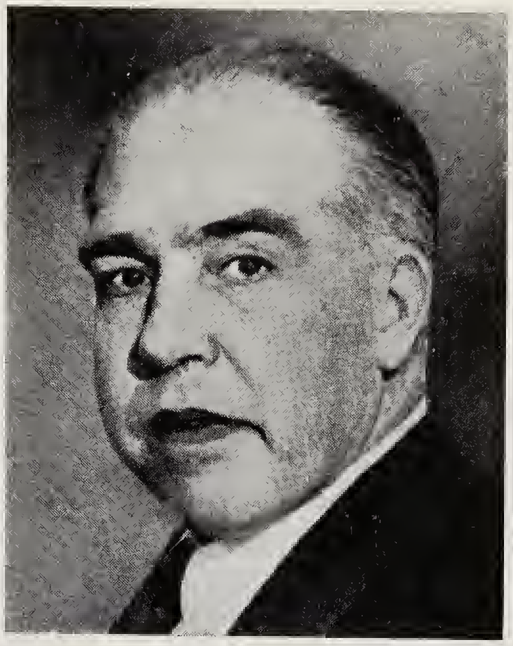
In the spring of 1912, however, Bohr went to Lord (Ernest) Rutherford's laboratory in Manchester, arriving just at the time when, as he tells us, Rutherford and his students "were eagerly occupied with tracing out the consequences of his [Rutherford's] new view of the nuclear structure of the atom." It was this point of scientific contact which launched Bohr on his own career. As he modestly states, "enthusiastic for the great promises of the new theoretical outlooks," he came under the inspiration "of the unique friendliness and straightforwardness with which Rutherford [whom he elsewhere characterizes as a man of "powerful personality" and acute judgment] . . .was always prepared to listen to any student behind whose youthful inexperience he perceived a serious interest." It was during this stay in Manchester that Bohr formulated the theory which has since earned him the title of "the founder of modern atomic theory."

The atomic model which Rutherford proposed just before Bohr reached Manchester (as described by Bernard Jaffe in *Outposts of Science*) consisted of a positively charged nucleus around which revolved in orbits, like planets around the sun, electrons of a number to neutralize with their negative charges of electricity the corresponding number of positive charges in the nucleus. Almost at once, however, this theory encountered a fundamental difficulty, for observation showed that the emission of light accompanying the revolution of the electrons did not, as should be the case according to the older theories of electricity and magnetism, lead to a contraction of their orbits until the electrons fell into the nucleus.

The two papers which Bohr published in 1913 in the *Philosophical Magazine* of London not only solved this problem, and that by a revolutionary physical concept, but also provided the explanation for the characteristic spectra of the elements which had heretofore been known but not understood. As he pointed out years later in a radio address, Bohr realized "the impossibility of explaining many characteristic properties of atoms by means of the ordinary laws of physics, which apply to the behavior of matter in bulk." He was also aware of Max Planck's quantum theory, that the energy of radiation is discontinuous and occurs in minute exact measurable units called quanta.

The use Bohr made of Planck's theory is explained for the layman in George W. Gray's volume *New World Picture.* Retaining the nucleus and the revolving electrons of the Rutherford atomic picture, Bohr thereupon postulated a series of fixed orbits in which the electrons travel without emitting light and therefore without being drawn toward the nucleus. In these orbits the electrons are regarded as in "stationary states" because their energy content does not change and hence they travel at a uniform rate of speed. However, disturbance by an impact or by exterior radiation will cause a temporary displacement of the electrons, which will at once attempt to return to the home orbit by means of jumps. Each jump from an outer orbit to the adjacent inner orbit will be accompanied by the emission of a quantum of light, representing "the difference in energy between the higher [more distant from the nucleus] orbit just left and the lower orbit just occupied." This is the only time when light will be emitted. As Bohr phrased it, "For each atom there exists a number of definite states of motion called stationary states, in which the atom can exist without radiating energy. Only when the atom is disturbed and passes from one state to another can it radiate light."

With the exception of a brief lectureship at the University of Copenhagen in 1913, Bohr had remained in Manchester, where he formulated his theory, until 1916, first in the Rutherford Laboratory and from 1914 also as lecturer at the University of Manchester. In 1916 he returned to Denmark to become professor of theoretical physics at the University of Copenhagen. In 1920, when the university, largely at his recommendation, established the Institute for Theoretical Physics (with the aid of a Rockefeller Foundation endowment), Bohr became its director. Under his leadership (which was interrupted only during the Nazi occupation of Denmark), the institute has become world famous and has attracted some of the world's most renowned physicists. Bohr himself has been in constant demand on the lecture platforms of the leading universities of England and America and before the scientific societies of the world.



NIELS BOHR

Bohr's frequent contributions to *Nature*, one of England's foremost scientific periodicals, show how active he has been in the development of quantum mechanics, to which his original atomic model gave the impetus. Gray has pictured him in this respect essentially as "a sort of elder brother of the youthful revolutionaries, encouraging and criticizing and sometimes interpreting through the contribution of a generalizing principle." And while, as he himself is the first to admit, scientific discoveries are the work not of one man but of many, his name is closely linked with two guiding principles which attempt to reconcile the two dominant trends of thought in contemporary physics—quantum, and wave, mechanics—and to integrate the modern conceptions of matter.

The first of these is the "correspondence principle," which (in the words of Hans Reichenbach in *Atoms and Cosmos*) "says that there must be a gradual approximation of the atomic model to the forms of macroscopic theory—that is, the theory of large-scale matter—when the electrons are at a rather great distance from the nucleus . . . it formulates the thought that only such a conception of the atom can be correct as goes continuously over into the old conception when dimensions are larger. For that the old conception holds good in the large is sufficiently attested by all experience, and a theory which takes no account of that fact is necessarily false." On this basis, Werner Heisenberg, a student of Bohr's, created a new mathematics for quantum mechanics, which has been called "an exact formulation of Bohr's Principle of Correspondence."

The second principle developed by Bohr springs from the experimental observations that a light ray at times presents the characteristics of wave motion and at other times of particle motion, but never both traits at the same time. The wave behavior and the particle behavior, therefore reasoned Bohr, "are complementary and mutually exclusive." With

BOHR, NIELS—*Continued*

recognition of this Principle of Complementarity, as with the Correspondence Principle, physics took another step forward.

In the winter of 1938-39, Bohr was working with Einstein '41 at the Institute for Advanced Study in Princeton, New Jersey, and it was through his presence there at that time that he was able to help set the Allies on the path to the manufacture of the atomic bomb. The immediate story goes back to 1938, when Otto Hahn, Fritz Strassmann, and Lise Meitner '45, in repeating an experiment in uranium atom bombardment performed earlier by Enrico Fermi in Italy, were obtaining the element barium in the results, where no barium should, by all known standards, have been. Forced to flee by the Nazis, Dr. Meitner reached Bohr's laboratory in Copenhagen with the tentative conclusion that the barium had resulted from the fission, or splitting, of the uranium into two new elements nearly equal in atomic weight, and that, according to an Einstein formula, a tremendous amount of energy should have been released. The news was at once transmitted to Bohr in America by his laboratory assistant Otto R. Frisch, who himself prepared to verify the experiment. Bohr for his part communicated the information to Fermi '45 and John R. Dunning at Columbia University and the results were quickly verified. At a meeting of theoretical physicists at George Washington University in Washington, D.C., a few days later, reported William L. Laurence '45 in the *Saturday Evening Post* in 1940, Bohr had the privilege of announcing to the world that the atom had been split. (This is the story according to the printed accounts of 1939 and 1940. The War Department report states that Lise Meitner gave the information directly to Bohr in Denmark, who took it to the United States with him, whence by indirect communication it reached Fermi at Columbia.)

The splitting of the uranium atom, however, had been expected to create a reaction of chain explosions. When this did not materialize, Bohr, at a meeting of the American Physical Society at Columbia University in February 1939, together with his Princeton colleague J. A. Wheeler, suggested that it was the rarer uranium isotope 235 which was responsible for the splitting and the more abundant U-238 which was inhibiting the process. This prediction was proved correct in 1940 after enough U-235 had been isolated to make the test.

Meanwhile, Bohr had returned to Denmark. And in April 1940 he halted work in the Institute for Theoretical Physics in protest against the Nazi invasion, devoting his time thereafter, according to a Scandinavian source, to "expounding the cause of liberty." (The institute was later raided by the Nazis, but nothing of value was found.) In September 1943 Bohr was forced to flee, taking with him, it is said, his precious atomic data. Landing on the Swedish coast from a fishing boat, he was taken into custody by the Swedish police—for his own protection at the request of the Danish underground—and nineteen days later was flown to England in the bomb bay of a Mosquito bomber. His movements after that are still clouded in censorship, but it is known that he came to the United States, and that he made several trips between England and America. Henry D. Smyth in the War Department report states that Bohr "spent a great deal of time at Los Alamos [the atomic bomb laboratory in New Mexico headed by J. R. Oppenheimer '45] and gave invaluable aid." It is Bohr's contention that atomic energy must be subject to international control. Once the secret of its manufacture was known, he has said, the sole advantage held by the United States would be that country's extensive engineering facilities.

Bohr received the Nobel Prize in Physics in 1922. He has also received the Hughes Medal from the Royal Society in London (1921), the H. C. Oerstad Medal from the Society for the Propagation of Natural Science (1924), the Norwegian gold medal from the University of Oslo (1924), the Barnard Medal from Columbia University (1925), the Mateucci Medal from the Societa Italiana della Scienze in Rome (1925), the Franklin Medal of the Franklin Institute in Baltimore (1926), the Faraday Medal from the Chemical Society of London (1930), the Planck Medal from the Deutsche Physikalische Gesellschaft (1930), and the Copley Medal from the Royal Society in 1938. He holds honorary degrees from the Universities of Oxford, Manchester, Edinburgh, London, and Oslo, among others. He is president of the Royal Danish Academy of Science and a member of more than twenty of the leading scientific academies of the world. He is the author of two volumes *Theory of Spectra and Atomic Constitution* (1922), and *Atomic Theory and Description of Nature* (1935), and of numerous scientific papers.

The physicist was married in August 1912 to Margrethe Noerlund, the daughter of a pharmacist of Slagelse, Denmark. They have four sons. Bohr, wrote one reporter, is "big and solid, with a strong, creased face overhung by the remnants of a once thick shock of hair. He speaks slowly through broad lips, and his platform manner is quiet. As often as not he stands with his hands shoved into his coat pockets. As often as not his coat could stand a pressing." Long ago Einstein said of him, "What is so marvelously attractive about Bohr as a scientific thinker is his rare blend of boldness and caution; seldom has anyone possessed such an intuitive grasp of hidden things combined with such a strong critical sense. With all his knowledge of the details, his eye is immovably fixed on the underlying principle. He is unquestionably one of the greatest discoverers of our age in the scientific field."

BOLTE, CHARLES G(UY) (bōl-tā) Jan. 19, 1920- Veterans' leader

Address: b. American Veterans Committee, 554 Madison Ave., New York City; h. 416 W. 20th St., New York City

A disabled veteran of the Second World War, Charles G. Bolté returned to the United States in 1943 wondering how the ideals for which he had fought could be realized and safeguarded. He believed that military victory would not automatically bring peace, jobs, and freedom, but that positive steps would have to be taken by those who won the war to preserve the peace. Now, as national chairman of the American Veterans Committee, an organization of Second World War veterans, he has become one of the most articulate spokesmen for the new veteran.

A native New Yorker, Charles Guy Bolté was born on January 19, 1920, to Guy Willard and Marion (Stewart) Bolté. He received his education at Greenwich High School and at Dartmouth College, where he was elected to Phi Beta Kappa and was associate editor of *The Dartmouth,* the daily campus newspaper. Like most of his generation, writes Bernardine Kielty of *Book-of-the-Month Club News*, he was a pacifist: "no more wars for democracy. . . .In 1939 he still saw the European war as 'imperialist struggle.' Like most boys he hadn't yet thought it through for himself, and was accepting the slogans of the party line. Then France fell, London was blitzed, and the truth got through to him. His editorials now fought for preparedness, for eventual American participation."

Immediately after his graduation in 1941, Bolté and four of his friends decided not to wait for the United States to enter the war. They enlisted in the British Kings Royal Rifle Corps, a motorized infantry regiment which had originally been formed on American soil in 1756, at the time of the French and Indian War. After nine months in the ranks, Bolté was sent to Officers Training School and commissioned as a second lieutenant. His outfit reached North Africa in the summer of 1942, where it fought with the British Eighth Army against Rommel's[42] Afrika Korps. Four days after the beginning of the British offensive at El Alamein, Lieutenant Bolté was shot in the right leg while, as he describes it, "foolishly standing up." The leg was amputated above the knee by an Australian surgeon in a field hospital. Of Bolté's four friends, two were killed and two seriously wounded. Bolté himself was awarded the Star of Africa.

After convalescing in a Cairo hospital for eight months, Bolté was fitted with an artificial leg, sent home, and discharged. He arrived in the United States in June 1943, and was married a month later to Mary Brooks Elwell, a girl whom he had known before he joined the service and with whom he had been corresponding during his months of convalescence. Fulfilling his old ambition to have some sort of a writing career, after his marriage the young veteran procured a job as a military writer with the OWI in New York. He stayed with the Office ten months, leaving in 1944 to join the Ziff Davis Publishing Company. He worked there a short time before resigning to devote all his time to the growing American Veterans Committee.

David Pierce Studio

CHARLES G. BOLTE

The American Veterans Committee, Inc., whose "Statement of Intentions" emphasizes full employment opportunities and a democratic way of life in the postwar world as the primary needs of its members, was the first organization formed by and for the benefit of the veterans of the Second World War exclusively. It was started in January 1943 as a kind of committee of correspondence among twenty-five servicemen, all old friends, who were worried about their future in the postwar world. Gradually their letters became bulletins mirroring soldiers' thoughts in the various theaters of war. When they realized that they all agreed upon the need for veterans to work together after the war, the AVC began to take form. As the number of subscribers and contributors to the bulletin grew, and because of their constantly changing Army addresses, the group decided to establish permanent headquarters with a veteran in charge. By that time Bolté had joined the organization and was suggested for the job. In February 1944 he became editor of the monthly publication, *Bulletin,* and general manager of AVC affairs. Bolté conducted all business from his own apartment until increased funds from sympathetic persons enabled him to give AVC an office address. The June 1944 Mediterranean edition of *Stars and Stripes* printed a short account of the new committee. Within two weeks Bolté received more than three hundred V-mail letters of application. By September 1945 the steadily growing membership had reached about four thousand. American men and women, of any race, creed, or color, who are now serving with or have been honorably discharged from the armed forces, merchant marine or Allied forces are eligible for membership. For veterans, the dues are $3 per year, and for members still in service, $2.

Until the time of complete demobilization when it can elect officers and adopt a constitution, the AVC prefers to continue to function in its present "formative" stage. The "State-

BOLTE, CHARLES G.—*Continued*

ment of Intentions" now acts as the basis of AVC thought and action, demanding for veterans: "Adequate financial, medical, vocational, and educational assistance. . . .A job . . . under a system of private enterprise in which business, labor, agriculture, and government work together to provide full employment and full production. . . .Thorough social and economic security. . . .Free speech, press, worship, assembly, and ballot. . . .Disarmament of Germany and Japan. . . .Active participation of the United States in the United Nations organization to stop any threat of aggression and to promote social and economic measures which will remove the causes of war. . . .An international veterans' council for the furtherance of world peace and justice among the peoples of all nations."

When the United Nations Conference on International Organization was being organized, Bolté, using the *Bulletin*, polled the AVC members on their opinions of a world organization. He did this in spite of an Army order which prohibited the polling of its personnel, but he was determined to give AVC members representation at San Francisco. Military authorities took no action against Bolté, however, and when he applied, he was given permission to send a committee of consultants to the American delegation at the conference. The committee included Bolté himself, Arthur W. Coats, Jr., the West Cost representative, and Private Alfred M. Lilienthal, who was the only enlisted man in uniform with official status at the conference. The three men reported to the delegation the results of the AVC poll, which had shown that the members favored the immediate formation of a strong United Nations organization and were willing to fight again, if necessary, to preserve the peace.

Since the success of his first poll, Bolté has made a practice of using the *Bulletin* (now published semi-monthly) to poll AVC members on questions of pertinent national legislation. He is working to destroy the public's stereotyped impression of "GI Joe." Bolté insists that GI Joe does not exist. "Beneath the collective idea of a division or a ship's company," he says, "the United States armed forces are composed of twelve million men who came from all the cities and towns and farms of America, taking with them every variety of experience and background." He feels that noncombatants who spent a few weeks in battle areas are not qualified to voice opinions of the soldiers' problems. Bolté is expressing the feeling of the AVC when he insists that no men except those who have served in the armed forces during the Second World War can presume to speak for the new veterans—particularly not Congressmen who toured the battle fronts, nor veterans' organizations of the First World War.

Bolté's book *The New Veteran: Hero or Problem?* excited wide interest when it appeared in November 1945, book reviewers giving much space to the presentation of his ideas and arguments, and the plans of the AVC With few exceptions the critics' judgments were much like these: "His is a stirring message and an inspiring book. . . .His arguments are logical and his voice is powerful" (Harry Hansen '42); "this expression of ideals goes far deeper and will last considerably longer than the mere writing of a book" (Charles Hurd); "I am convinced that his book is a darned good thing, and so is his outfit" (Bill Mauldin '45). The communist *Daily Worker,* however, did not approve of Bolté's deprecation of the American Legion: "We Communists," wrote I. Weise, "do not advocate that the veterans form any one organization."

Bolté has written articles on veterans' problems and military topics for numerous magazines, the *Nation, Harper's, Life, Mademoiselle,* New York *Times Magazine, American Legion Monthly,* and *Liberty.* (He is on the editorial staff of *Convoy.*) He has also been consulted by Congressional committees on such matters as permanent conscription and full employment legislation. He and the AVC strongly favor any legislation which they think will benefit veterans, directly or indirectly, believing that benefits to the veterans should also be benefits to the whole community. "What we want," Bolté has said, "does not mean the largest possible soldiers' bonus that can be pressured out of Congress." In late 1945 he was appealing for better medical care, a more efficient guidance and placement service for the returned soldier, and effective action to ease the veteran's housing needs. He was also in increasing demand as a public speaker.

Charles Bolté has dark brown hair and eyes and a bristling mustache which does not disguise his youth. He is six feet two inches tall and weighs one hundred and sixty-five pounds. His favorite forms of recreation are playing tennis, listening to music, and playing the piano—"a little," he adds.

BONCOUR, JOSEPH PAUL- *See* Paul-Boncour, J.

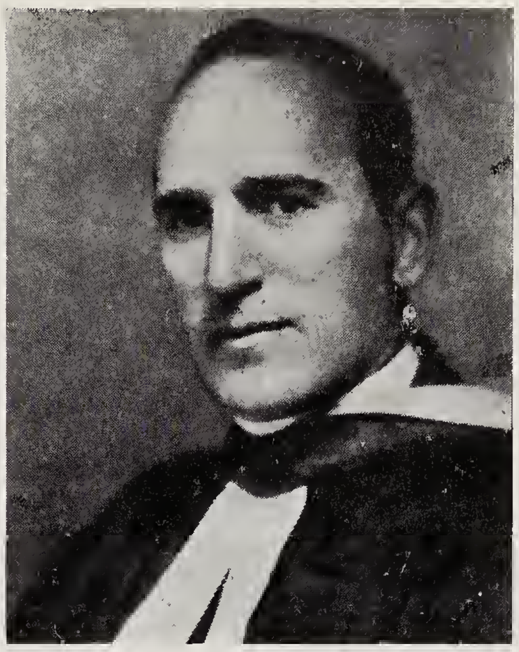
BONNELL, JOHN SUTHERLAND, REV. (bŏn-nĕl') Jan. 10, 1893- Clergyman

Address: b. Fifth Avenue Presbyterian Church, 7 W. 55th St., New York City; h. 1010 Fifth Ave., New York City

Dr. John Sutherland Bonnell, the Canadian-born pastor of the Fifth Avenue Presbyterian Church of New York City, for a decade has had an active career of unique social service. Well known as a platform and radio speaker, Bonnell has made an outstanding contribution to the life of the metropolis in which he now serves with the social service which he calls "pastoral psychiatry." Believing that there should be close cooperation between medicine and religion, Dr. Bonnell has made his study a consultation room, where since 1935 troubled people of "all shades of belief and disbelief" have received understanding and "spiritual prescriptions for mental ills." His method of psychotherapy, which has been called a venture in Christian helpfulness, is a combination of simple psychoanalysis and an invitation to call upon God in time of trouble, The son of Abraham and Catherine (Cameron) Bonnell, John Sutherland Bonnell was born on Prince Edward Island in Canada, on January 10, 1893. Although not a physician, Abraham Bonnell was for forty-six years a member of the staff of, and for the greater part of that time supervisor of, the Falconwood Hospital, an institution for the insane, in Charlottetown, capital of the island. From the age of ten John accompanied his father on his daily rounds through the institution and thus, while still a boy, came to recognize the various types of mental illnesses. In his book *Pastoral Psychiatry,* written many years later, John Bonnell has painted a vivid picture of his father, describing the fine relationship that existed between father and son. The elder Bonnell was a kindly, patient, wise man, with a strong faith and a belief in the effectiveness of religion in mental cases. He had had no training in psychiatry, but he read widely on the subject. Looking on his patients as his children, he was always courteous and considerate to them. "My father had a sane respect for the insane," Dr. Bonnell has written. The kindly supervisor, who was to have such a strong influence on his son, was able to quiet even the most intractable of the patients, who would follow him as he walked about, holding his fingers or touching his arms. He had enough skill to take care of surgical cases when necessary, and he also acted as chaplain, often calming the restless inmates by his simple talks in the hospital chapel.

When he was seventeen John became an attendant at the hospital and went to the lectures given for the nurses. Later he was assigned the care of a former lawyer named Broadlawn. Although psychiatrists had pronounced Broadlawn a paranoiac, he was a brilliant scholar, and for two and a half years he prepared John for college, tutoring him in algebra, geometry, and Greek. Quarrelsome and suspicious with others, Broadlawn was calm and intelligent when with his pupil-nurse. The youth was resourceful in dealing with his patient's "sit-down strikes" and other vagaries, and the man and boy became fast friends. It was Broadlawn who first advised young Bonnell to go into the ministry. "If you can combine the knowledge you are gaining here [at Falconwood] with the power of religion to stabilize minds, you will blaze trails!" the lawyer used to declare. Today Dr. Bonnell feels that these early years at the hospital were, in a sense, his apprenticeship to the ministry.

At the outbreak of the First World War, John Bonnell was in Halifax completing his preparations to enter college as a divinity student. There Broadlawn, having escaped from the institution, sought the aid of his former pupil in enlisting in the Canadian artillery. Feeling that the lawyer had greatly improved in mental health, Bonnell helped him with his arrangements. Two years afterward, in 1916, Bonnell left college to enlist in the Army himself. On the troopship sailing from Halifax that September the young recruit met Broadlawn, now a sergeant; ten months later while fighting in France he learned that the friend whom he had helped to normal living had been killed in action, thus canceling what Broadlawn had always called his "debt to God and society."



REV. JOHN SUTHERLAND BONNELL

On the front line in France with the Fifth Canadian Siege Battery (heavy artillery), Bonnell became the senior sergeant of his unit and was made acting sergeant major. At Falconwood he had learned that men could often be controlled by showing trust and gentleness toward them; at the front in 1917, when it became necessary to subdue men made obstreperous by drinking, he was to learn the necessity on occasion of unbending firmness in dealing with those who rebel against authority. The Canadian sergeant was wounded twice while in action and in 1918 was invalided home to Canada, where he resumed his studies for the ministry. He received his B.A. degree at Dalhousie University at Halifax in 1919, and on two occasions he took postgraduate work at the University of London. (At Pine Hill Divinity Hall in Halifax he received the B.D. degree in 1927, and in 1934 his D.D. degree.)

In 1922 John Bonnell was ordained a Presbyterian minister and took the pastorate of his first church, St. Andrews, in New Brunswick, Canada. He was married in 1923 to Bessie Louise Carruthers, and the couple remained at St. Andrews until 1929. Bonnell then became pastor of the Westminster Church in Winnipeg. After six years in Winnipeg, in 1935 he was called to the Fifth Avenue Presbyterian Church in New York City, where he has been pastor since that time.

Dr. Bonnell's psychiatric clinic was begun in 1935, the year he became pastor of the New York church. By 1941 six thousand men and women had come to him with their problems of futility, insecurity, inferiority, social failure, alcoholism, and emotional difficulties. Some of these people were definitely psychotic cases, beyond the minister's help, but most of them were people outwardly leading normal lives while inwardly carrying a burden of guilt or anxiety great enough to make them unhappy or unstable. In almost all the cases described in his

BONNELL, JOHN SUTHERLAND, REV.—*Continued*

book *Pastoral Psychiatry* Dr. Bonnell has found that his "pastoral psychiatry" has helped. He has found that confession of the problem to a sympathetic and patient listener—a counselor whose sixth sense is alert to hidden distress signals—gives the confessor much relief. Dr. Bonnell follows this with suggestions for prayer and spiritual reading. It has been said that he has introduced atheists to the Bible and taught doubters how to pray; he has prevented divorces, suicides, and nervous breakdowns; and he has cured functional disorders in the patients sent to him by physicians.

Bonnell points out that, according to the Greek derivation of the word "psychiatry" and the occurrence of the idea in the New Testament, the subject pertains primarily to the soul and secondarily to the mind. In his work as pastor and mentor, he directs his efforts to the healing of souls as medical psychiatrists direct their efforts to the regulating of feelings, emotions, and thoughts. He does not consider himself a psychiatrist in the medical sense, and warns clergymen to be wary of becoming fourth-rate psychiatrists, though he thinks they should study the methods of psychiatrists and psychologists to improve their own approach to their consultants. The pastor believes that there is some spark of religious instinct in everyone, even if he has not gone to church or prayed for years; he believes, too, that the spiritual urge needs only to be aroused to be of immeasurable help to the individual needing strength. The method employed by Bonnell is taking root and spreading among Prostestant churches, a number of which now have clinics similar to the one at the Fifth Avenue church. The *Reader's Digest* also points out that young men studying for the ministry are now studying and working in hospitals and penal institutions as part of their training to be physicians of the soul.

In May 1941, on the invitation of the Right Reverend J. R. Forgan, moderator of the Church of Scotland, Dr. Bonnell flew to Great Britain on a six weeks' good-will mission, representing the Presbyterian Church in the United States of America, the Federal Council of Churches of Christ in America, and other religious bodies. On this trip he went to Scotland, England, and Eire; he broadcast to America from England and delivered thirty addresses and sermons in churches, halls, air-raid shelters, shipyards, and soldiers' and sailors' barracks. As official delegate to the General Assembly of the Presbyterian Church of the United States of America, he attended the impressive meeting of the General Assembly of the Church of Scotland. Dr. Bonnell described the tour in his book, *Britons Under Fire* (1941), which critics considered a splendid contribution to the war effort in that it was an honest and inspiring report of the courage of the British people in wartime.

In addition to writing *Pastoral Psychiatry* and *Britons Under Fire*, Dr. Bonnell in 1936 compiled *Fifth Avenue Sermons*, a selection of twenty-one of his weekly sermons. (Each month one of his sermons is printed in the church bulletin and later in pamphlet form.) "These sermons," commented one reviewer, "explain why Dr. Bonnell is so universally acclaimed as one of the best present-day preachers." His "mind has been highly trained, and shows fruitful acquaintanceship with life and letters," wrote the critic of the New York *Herald Tribune*. ". . . This Fifth Avenue preacher knows the dangers of emotional evangelism, but he has not yet escaped them. His discourses are nonetheless readable and on occasion stimulating." Sunday morning sermons, delivered in "a forceful but restrained voice," draw an average weekly attendance of eighteen hundred persons to his Fifth Avenue church.

During the Second World War the pastor's sermons have frequently been on international topics, among them postwar problems. In October 1945 he suggested that a group of representative American religious leaders go to Russia to confer with the Patriarch of the Greek Orthodox Church, to serve as "ambassadors of Christian hopefulness and good will" and so arrest the "rapidly deteriorating" relationships between the United States and Soviet Russia. Declaring that "the world is big enough for different forms of government to exist without necessarily fighting each other," he added, "if the Governments are stalemated why shouldn't the churches act? . . . .The need of the hour is understanding and good will, and if we share some of the bountiful gifts that God has given to us with the suffering people of the world, we shall build up a good will that will mean much for international peace."

Since the year 1940 Dr. Bonnell and the Reverend Norman Vincent Peale, pastor of the Marble Collegiate Reformed Church, have conducted a weekly series of noon Lenten lectures under the auspices of the Greater New York Federation of Churches. In 1945 the subject was "Inner Strength for Wartime Living." From April 1942 to April 1944 the Fifth Avenue clergyman was a moderator of the Presbytery of New York City, and since 1938 he has been a lecturer at Princeton Theological Seminary. He received the honorary LL.D. degree from Washington and Jefferson College in 1943.

A popular preacher on the radio as well as in the pulpit and on the lecture platform, Dr. Bonnell has been broadcasting since 1943 over the American Broadcasting Company's network. For six months in 1943 he appeared weekly on the program *Our Spiritual Life*. Since then, beginning in January 1944, he has been appearing on an October-through-March schedule on the early morning program *Your Life Today*. Giving an eight-minute weekly address, Dr. Bonnell has alternated with other speakers on this daily program of religious talks. During these years and earlier, when the clergyman spoke over the Red Network, tens of thousands of listeners have requested copies of his talks.

The Bonnells have four children: a son, George Carruthers, and three daughters, Catherine Cameron, Elizabeth Louise, and Jessie Margaret. George Bonnell was studying for the ministry when he entered the service as a private in the Army of the United States; he was wounded in Italy in October 1944. Although the family are devoted to their Canadian homeland and maintain a summer home there on Prince Edward Island, Dr. Bonnell became a citizen of the United States in January 1945. In figure the clergyman is tall and slender; his face is sharp-featured, his hair dark. A quiet, yet warm and friendly person, he has been called a good "listening post."

BONNET, HENRI (bô″nĕ′ äɴ″rē′) May 26, 1888- French Ambassador to the United States

Address: The French Embassy, Washington, D. C.

In keeping with his belief that "France cannot conceive a victory without a world organization," and that the United States will be of foremost importance in such an organization, General Charles de Gaulle '40 selected as his Government's first ambassador to the United States after its liberation from the Nazis a man who is a champion of strong international ties—Henri Bonnet. While Ambassador Bonnet is considered representative of the distinguished intellectuals whom the French traditionally appoint to important diplomatic posts, he also typifies the new generation of statesmen who are striving to widen the scope of international understanding. Not only has he devoted many years to the study of international problems, but in his post in the Secretariat of the League of Nations, he took part in many international conferences in Europe, Asia, and America. He is also the author of a number of books dealing with postwar plans for a world organization.

Henri Bonnet was born May 26, 1888, in Châteauponsac, in the mid-western department of Haute-Vienne. His parents, J. T. H. and Marie Thérèse (Lascoux) Bonnet, were of the intellectual middle class. They sent him to the University of Paris and in 1912 to l'Ecole Normale Supérieure in Paris, from which he was graduated with the degree of *agrégé,* an academic rank that entitled him to appointment to the highest teaching posts in lycées or on certain faculties of universities. Further study in history (the subject in which he had majored) was interrupted by the First World War, at the outbreak of which Bonnet was drafted, and from which he was discharged at its close with the rank of captain. He received several citations for bravery and was made a Chevalier of the Legion of Honor.

Re-entering civilian life Bonnet continued his work in history, specializing in foreign relations. By 1919 he had become the foreign editor of the Paris newspaper *L'Ere Nouvelle* ("The New Era"), and in another year, when the League of Nations came into existence, his knowledge of foreign affairs led to his appointment to a post in the Secretariat. Attached first to the Division of Press and Information, he later became the head of the cabinet of the Assistant Secretary-General of the League. Between 1920 and 1931 he attended international conferences of the League which were held in Geneva and other European cities as well as in China, Japan, Canada, and the United States. In 1931 he left Geneva to become the director of the International Institute of Intellectual Cooperation, a division of the League of Nations with offices in Paris.

French Press & Inf. Service
HENRI BONNET

Bonnet outlined the work and history of this division of the League in a chapter entitled "Intellectual Cooperation," which he contributed to a symposium on the League of Nations, *World Organization* (1943). The framers of the Covenant of the League, like the framers of the Constitution of the United States, included nothing about education or intellectual cooperation. The League had therefore no legal basis on which to form a technical organ for the important work of promoting better understanding among nations in intellectual and spiritual matters. During the first Assembly meeting in 1920, however, a committee was formed for the purpose of studying the problem. Among its very first members were Mme. Marie Curie, Albert Einstein '41, Robert Millikan '40, and James T. Shotwell '44. In 1924 the Council and the Assembly of the League approved of the establishment of a technical organization (with the same status as other divisions), and in January 1926 the International Institute of Intellectual Cooperation was founded. The Institute was supported by funds provided by annual subsidies from forty governments and by grants from the Rockefeller and Carnegie foundations.

An important part of the work was the organization of "Conversations" and the publication of "Open Letters." Discussions at the Conversations or conferences, which were held in the countries of cooperating governments, were devoted to the exchange of information and drafting of plans on such subjects as reorganization of courses of higher study, the organization of international propaganda through radio and motion picture media, and scientific cooperation. Work of a more technical nature consisted of regular interchange of views and methods among libraries and institutes of arts and archeology; the establishment of inter-university relations and of a

BONNET, HENRI—*Continued*

uniform terminology in the sciences; and the introduction of instruction in schools on the aims of the League of Nations.

"It should be emphasized," says Bonnet, "that this machinery was an integral part of the League of Nations and at the disposal of the governments participating in its activities, among which were a certain number of non-member states." The most striking example of a direct request, says Bonnet, was that made by China (a member country) in 1931 for an educational mission to advise in the planning of the reorganization of Chinese schools. Bonnet, as Secretary-General of the International Conference of Higher Studies within the Institute, was selected for this work. During this period (1931-40) Bonnet also acted as vice-president of the Studies Center of Foreign Politics.

While never prominent in Parisian social circles, Bonnet during his residence there maintained an elaborate apartment and had an estate in Poitiers, where he gave hunting parties. In 1932 the statesman was married to Helle (Zervoudaki) Aghnaides, the daughter of a wealthy Greek tobacco merchant and former wife of Thanassis Aghnaides, the present Greek Ambassador to the Court of St. James. The Bonnets managed to escape from Paris to London with two suitcases before the Nazis conquered France.

During a month's stay in London Bonnet became active in the "Free French" movement. He carried on the work after his arrival in the United States, too, serving on the executive committee and as one of the vice-presidents of France Forever, which was associated with the Fighting French delegation. His decision to come to the United States was influenced by an invitation from the New School of Social Research in New York City. Later he became a member of the faculty of l'Ecole Libre des Hautes Etudes, or Free School for Higher Studies, which was set up after the fall of France by the French and Belgians, with the aid of the New School. He also served on the Council of the Free World Association and on the editorial board of that association's monthly magazine, *Free World*. Much of his time, however, was spent in Chicago as special adviser to the World Citizens' Association, which had been organized in December 1939 for the purpose of developing world-community awareness. Among its directors were Joseph E. Davies '42, Quincy Wright '43 and Anita McCormick Blaine. Working under the sponsorship of this organization, Bonnet edited or wrote a number of books.

The first of these volumes, *The World's Destiny and the United States*, written in 1941 before Pearl Harbor, contained the conclusions of thirty men and women on some of the important problems which are now confronting the democracies and will continue to confront them after the Second World War. *The United Nations, What They Are, What They May Become* (1942) reviews the existing means of collaboration and indicates how an organization might be created which would translate into reality the concept of the United Nations and make them a dynamic power for war and peace. In another study, *United Nations on the Way: Principles and Policies* (1942), Bonnet analyzed treaties and agreements of the United Nations and the utterances of their leaders, indicating in some detail the social, economic, and political adjustments necessary for the achievement of a peaceful world. Supporting De Gaulle's opposition to blocs or European spheres of influence, Bonnet wrote in his *Outlines of the Future* (1943): "In order to prevent the return of these catastrophes which have twice loosed destruction on the world, the United Nations must continue to turn to new formulas. These formulas must assert that the distrust resulting from the spirit of political nationalism which the war—for a time at least—will have intensified, is no longer justified." In speaking of the United Nations, he said, "This is not a great alliance of a few powerful nations which tomorrow will control the world—continents or parts of continents. Any combination of powers not enjoying the full support and trust of all the peoples finally freed from fear and which possess only greater physical strength, would not even last as long as those after the Napoleonic Wars. . . .There likewise cannot be a return to the patchwork pattern of nations refusing to recognize their patent interdependence."

On June 3, 1943, the French Committee of National Liberation was formed under the joint chairmanship of De Gaulle and General Henri Honoré Giraud '43. Henri Bonnet was elected as Commissioner of Information after De Gaulle and Giraud had refused to accept each other's nominees. Bonnet was described as a "neutral" on the Giraud-De Gaulle question, although it was pointed out that his executive post with the Fighting France group indicated that his views were close to those of De Gaulle. Never having held any political office, Bonnet, at the time in Chicago engaged in research work, expressed surprise at his appointment. When interviewed by the American press he said that his only contact with De Gaulle had been in London just after the founding of the "Free French" movement (June 18, 1940). Regarding his sympathies, Bonnet declared: "Today the question of whether one is a Giraudist or a De Gaullist is not important. We have been appointed as a unit for France and we will serve as such." The new Commissioner of Information assumed his portfolio in Algiers on June 23, 1943.

A few days after taking office Bonnet announced his intention of unifying the De Gaullist and Giraudist press services which had been operating separately. He also soon gave evidence of wanting to give the press representatives the fullest information possible. In February 1944, following the resignation of Giraud as co-chairman of the Committee, Bonnet submitted a plan for a complete reform of the French press to the Provisional Consultative Assembly in Algiers in the form of a law. Its purpose was to keep the press from being influenced by commercial or financial interests or by foreign governments; and it proposed that a French information agency be created on the model of the American press associations, although it limited to some extent the American idea of the freedom of the press, at least for the period of transition between the liberation of France and the establishment of a regular government. The plan also included suggestions that relations among press associations of various countries be discussed at international conferences after the war; in the meantime an interchange of news among the "most important agencies" would be the sole basis of cooperation. Bonnet's plan also called for immediate reform of newspapers published in French North Africa and other French overseas possessions. It proposed that new papers be established in liberated France, that Nazi controlled papers be suppressed. The new papers would publish communiques issued by the temporary government but would be free to present the views of the political parties represented in the Higher Council of Resistance. Independent newspapers would be allowed to present news objectively.

The following summer the French news distribution decree was jointly criticized by American and British press representatives for giving a monopoly to the French agencies. To remove misunderstandings, Bonnet called a press conference at which he explained that the decree was merely temporary—that it did not imply continuing Governmental control after France was fully liberated. And in answer to the criticism that the ordinance bears no express provision that it is temporary, Bonnet contended that its very nature makes it so, since its stipulated purpose is to revive French newspapers and periodicals. "When this has been done," he said, "the ordinance will become obsolete." (Since assuming his Washington post, Bonnet, in addressing a meeting of the United Nations Information Board on January 4, 1945, stated that the French press encountered today no other restrictions than those imposed for military reasons.) Resigning his position as head of Information shortly after the French Provisional Government moved from Algiers to Paris, Bonnet gave as his reason: "Most key Government posts should be held by active members of the Resistance."

On New Year's Day 1945 Henri Bonnet presented his credentials to President Roosevelt '42 as France's first ambassador to the United States since the departure of Vichy's representative. Crossing to the State Department Bonnet then signed the document which made France the thirty-sixth member of the United Nations. In a brief speech he repeated the faith he so often had expressed in his books on the United Nations: "To this great cause France is prepared to devote herself wholeheartedly. . . .She knows that from now on, in a world where science and technology have surpassed distances, war, once begun, will spread over the entire world. Consequently she is convinced that any threat of attack must be met and, if necessary, curbed. She knows also that during this war the fraternal cooperation of the United Nations has proved that splendid results may be obtained in all domains through mutual aid, division of work, and the organization of a common effort toward the same goal." indicated that his views were close to those of

In other addresses delivered later in the year, Bonnet stated that the increase in markets for American goods in France and resumption of large-scale French exports to the United States depend on the speed with which America aids France in her economic recovery. When Georges Bidault '45 left the San Francisco conference in May, the Ambassador took his place as head of the French delegation. (He was the recipient of the honorary degrees of Doctor of Laws from Brown University in February 1945 and from Howard University in June 1945.)

The French Ambassador's scholarly background has not suppressed his sense of humor nor his "human touch." On Thanksgiving Day, shortly after his appointment to Washington, he entertained at dinner six American GI's. When all the possessions of the Bonnets were confiscated by the Vichy Government and they found themselves without money, they met with poise and ingenuity the task of earning a living in foreign surroundings—he as a teacher and she as a milliner. In a recent interview in the library of the big Tudor house that is the French Embassy, the tall, slender, dark-haired Helle Bonnet, who had been educated in a convent in Smyrna and at a finishing school in Lausanne, related how she had started the Helle Hat Shop in New York City in 1942 on a capital of only twenty-five dollars. (Elsa Maxwell '43 reported that the hats were in exquisite taste and that Mme. Bonnet, despite her straitened circumstances, continued to be chic during her three-year exile.) Although neither the new Ambassador nor his wife had moved in diplomatic circles before they came to Washington, it is predicted that their dignity and charm would win friends for themselves and France. Bonnet has a ready smile, is tall, slim, dark, and wears a closely cropped mustache.

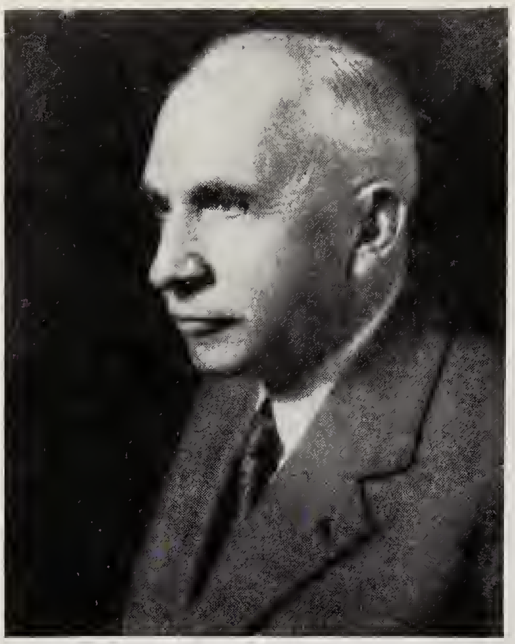
BONSAL, STEPHEN (bŏn′sȧl) Mar. 29, 1865- Author; journalist

Address: b. c/o Doubleday Doran & Co., Inc., 14 W. 49th St., New York City; h. 3142 P St., NW, Washington, D.C.

Perhaps "the most traveled of American reporters in the foreign field as well as the best and most readable literary stylist among journalists," is writer and historian Stephen Bonsal. As newspaperman and diplomatic aide he annotated virtually every conflict from the Bulgarian-Serbian War of 1888 to the First World War, visiting and surveying most of the countries of Europe, Asia, South America, and Africa. Bonsal's diary of the proceedings of the Versailles Peace Conference of 1919, where he served as interpreter for President Wilson and Colonel House, was published in 1944 under the title of *Unfinished Business*, and was awarded in May 1945 a Pulitzer Prize in the field of letters for 1944.

Born on March 29, 1865, in Baltimore, Maryland, Stephen Bonsal is the son of Stephen and Frances (Leigh) Bonsal. His father was a coffee importer and shipowner engaged in the Brazilian trade. Young Stephen attended St. Paul's School in New Hampshire until he was seventeen, when he became an *Ausserordentlicher* student, or auditor, at Heidelberg and Vienna universities. His work there earned him certificates in German and Italian literature. Afterward he returned to his Maryland home, where he lived until, as he puts it, he came a cropper with a mare. She was Lizzie Preston, owned jointly by Bonsal and Harry Harwood, the famous amateur steeplechase rider. One day she lost a race at a Sheepshead Bav (New York) track—and a portion of the Bonsal family fortune was lost with her.



STEPHEN BONSAL

The young man dallied briefly with the idea of joining the Foreign Legion, but in the end his good opinion of some of his own writing decided him on the field of journalism. He persistently plotted to secure a place on the New York *Herald*, and eventually succeeded in attracting the attention of one of its editors by an account of the thrilling escape of a Latin-American president from his ungrateful country. The reporting job Bonsal was given turned out to be as exciting as this introduction. He had the opportunity to report a riotous meeting of European revolutionaries, an experimental balloon flight, a trip in a submarine around New York Harbor, a Haitian revolution, and several sensational murders.

One of these stories appealed to the *Herald*'s owner, James Gordon Bennett, known as "the Commodore," who in 1887 sent for Bonsal to come to his London office. In London and on the Continent the new foreign correspondent moved entranced in an "ever-renewed and ever-changing gallery of important or fascinating people." He met Parnell, Gladstone, and Eleanor Aveling, the daughter of Karl Marx; and he himself came into the limelight with an exclusive story on the meeting of the uninhibited John L. Sullivan and the Prince of Wales. Later he scooped Arthur Brisbane with his article on the champion's fight in Paris with Charlie Mitchell.

Later in 1888 the Commodore assigned the twenty-three-year-old reporter to cover the "clouds over the Balkans . . . to be on hand whenever and wherever anything happens." In the course of the next few years Bonsal "crossed and recrossed the length and breadth of the Peninsula half a dozen times" on this beat between Vienna and the Bosphorus, as he observed the racial, political, and religious antagonisms that made the Balkans the powder keg of Europe. After three and a half years of this Bonsal was recalled to New York when he fell into disfavor with Bennett because of a dispute over his salary and expense account. The reporter who had mingled with royalty and leaders in social and political circles in Europe now found himself in the humble position of "emergency man" on the city staff, at a salary of three dollars a day plus space rates.

From 1893 to 1897 Bonsal was in the diplomatic service of the United States—he served as secretary of the legation and chargé d'affaires in Madrid, Peking, and Tokyo. Meanwhile, having been reinstated at the *Herald*, he reported the Sino-Japanese War in 1894-95, traveled through Siberia in 1896, rushed to the scene of the Cuban insurrection of 1897, after which he remained in the Caribbean area to report the Spanish-American War. From this period the journalist drew upon his observations for three books: *The Real Condition of Cuba* (1897), *The Fight for Santiago* (1899), and *The Golden Horseshoe* (1900).

In 1900 Bonsal joined a China relief expedition, and the following year he was reporting on campaigns in the Philippines. The next decade took him to Venezuela, Russia, Japan, the Balkans, the West Indies, South America, and Mexico, where he covered uprisings, revolutions, and wars. The year 1912 found him writing his book *The American Mediterranean*; in 1913 he served as secretary to the Governor General of the Philippines, then as commissioner of public utilities for the Islands the following year. After a special mission in Mexico, Bonsal took up his reportorial duties again in 1915, covering the progress of Hindenberg's army on Germany's East Front in the First World War. After a chance meeting with Colonel House in Berlin the correspondent was pressed into service as interpreter in a series of important meetings with German political figures in which House was engaged. In 1916 Bonsal left Europe to assume the post of adviser to the American-Mexican Commission.

When the United States entered the First World War Bonsal was commissioned a major, serving first at the Army War College in Washington and then, in 1918, with the AEF in France. During the preparations for the Peace Conference following the Armistice, Colonel House cabled General Pershing, asking for the services of his former associate, who was at that time an officer at General Headquarters. Bonsal began his duties as adviser on Balkan affairs, soon becoming the close associate of House in all matters relating to the peace. During the secret meetings of the Big Four—Wilson, Clemenceau, Lloyd George '44, and Orlando '44—the erstwhile reporter sat with the President and Colonel House as their confidential interpreter. Since no stenographic notes of the proceedings were kept and no official translations were made, Bonsal at their request made a practice of daily transcribing his notes in the form of a journal, which was used for reference. Urged to publish his notes on the drafting of the Versailles Treaty and of the Covenant of the League of Nations soon afterward, Bonsal demurred, believing that this "might be indiscreet on the part of a professional writer who had been given access to confidential information." (President Wilson had, however, given his permission for publication of the journal.) Later that year Bonsal participated in the inter-

Allied mission to Austria-Hungary and the Balkan States under General Smuts '41 and in a special mission to Germany and Bohemia.

During the years that followed—except for a ten-thousand-mile tour through Soviet Russia in 1931 and a trip across North China and Manchuria in 1934—Bonsal's activities received little public notice. Much of his time he devoted to contributing sketches and short stories to magazines. In 1937 he set down his reminiscences of his early journalistic career, covering the period from 1885 to about 1892, in a volume he entitled *Heyday in a Vanished World*. Enlivened with countless anecdotes about its author, European princes, prime ministers, and "just common people," the account was pronounced "quite as lively and immediate" as the books of his younger colleagues.

In 1944, when Bonsal's friends, among them Arthur Krock '43, pointed out that it was the writer's duty to publish his notes on the 1919 Peace Conference because "we were beginning to repeat the same mistakes that led to the tragedy of Versailles," he submitted them to the public in *Unfinished Business*. Written "with a flourish, with wit, and many a neat characterization of the celebrities he saw daily," *Unfinished Business*, wrote the critics, is entertaining as well as historically revealing. "This is the first book to supply the missing links in the chain of events that led to Woodrow Wilson's failure to build an abiding peace structure and induce his own countrymen to be a part of it," stated Arthur Krock in the New York *Times*; "and it supplies as much news to President Roosevelt '42, to Marshal Stalin '42, and to Prime Minister Churchill '42 as to average readers of the present generation, although the three chiefs of state have had access to many secret documents." "A more timely book than this could hardly be imagined," commented Allan Nevins. "In the construction of a durable and effective fabric of collective security the world truly faces 'unfinished business'. . . .We find a strong light poured on the reasons why the first effort broke down." In May 1945 it was announced that Bonsal had been awarded one of the 1944 Pulitzer prizes in the field of letters for this "distinguished book on the history of the United States." (At the end of 1945 Bonsal was at work an another book relating to the Peace Conference. To be published in the spring of 1946 under the title of "Suitors and Suppliants at Versailles," it will consist of excerpts from the journal he kept of the secret conferences of the Big Four.)

The author in his next book, *When the French Were Here* (1945), recalled the story of the French Expeditionary Force of six thousand soldiers who assisted the American colonists in their war for independence. Bonsal, who before Clemenceau's death in 1929 had planned to collaborate with the statesman, wrote the volume from unpublished reports and letters made available to him in the National Archives of France and from documents in the manuscript division of the Library of Congress. While many critics rated this "narrative of the sojourn of the French forces in America, and their contribution to the Yorktown campaign" (the subtitle of the book) as "a delightful excursion into an eventful and interesting chapter of American history," at least one (Virginia Kirkus) felt that Bonsal's book was "a concentrated phase of a war of the past studied in intimate detail—an objective and detached study for scholars, not for the general market."

The white-haired, mustached Bonsal, who is described as "a sardonic old realist" and "a brilliant raconteur," is a popular dinner guest. In his earlier years he enjoyed riding and fencing. He lives in Washington, D.C., with Mrs. Bonsal, the former Henrietta Fairfax Morris, to whom he was married in 1900. The Bonsals have four sons, Stephen, Philip Wilson, Dudley B., and Richard Morris; two are in Government work, and the other two have seen service in the Second World War. As if to sum up his long career, the veteran journalist introduced his autobiography with lines from an old English song which ends with, "This huntin' doesn't pay but we've prowli't up an' down a bit an' had a rattlin' day."

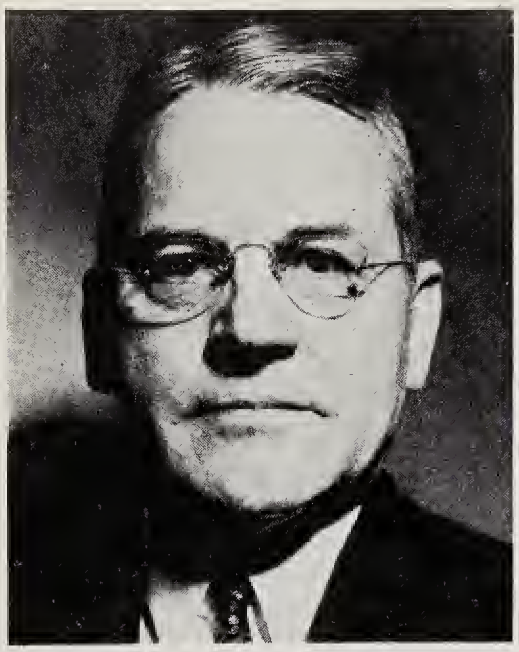
BOWMAN, ISAIAH Dec. 26, 1878- University president; geographer

Address: b. Johns Hopkins University, Homewood, Baltimore; h. 108 W. 39th St., Baltimore

The development of the world's resources to offset the destruction of war is considered one of the most important aspects of postwar planning. Isaiah Bowman, president of Johns Hopkins University, believes that the Second World War has taught the American people that modern geography is no longer children's geography, to be finished in the seventh grade, and that geographic science has a significant part to play in postwar planning. Widely known as an author and educator and as America's "leading expert on geography," Bowman throughout his lifetime has correlated scientific study with practical experience by leading a number of fact-finding geographic expeditions to South America, and by serving on directorial boards of many educational, geographic, cultural, and peace institutions, including the Woodrow Wilson Foundation, and the Council of Foreign Relations. Since 1942 the university president had also served as an adviser on foreign affairs to President Roosevelt '42 and former Secretary of State Cordell Hull '42, Bowman's particular contribution being the application of his knowledge of politics and geography to territorial problems and to popula-



ISAIAH BOWMAN

tion pressures and world organization for peace and security.

Isaiah Bowman was born in Waterloo, Ontario, Canada, on December 26, 1878. His parents were Samuel Cressman and Emily (Shantz) Bowman. Within two months after his birth his parents had moved to Michigan. He was graduated from the State Normal College at Ypsilanti, Michigan, in 1902, and from Harvard University with a B.Sc. in 1905. The year 1903-4 was spent at the State Normal College at Ypsilanti as instructor in geography. He was assistant in physiography at Harvard in 1904-5, and then went to Yale as instructor in geography and for graduate work in that subject, receiving his Ph.D. degree there in 1909. He was special lecturer in geography at Wesleyan University from 1907 to 1909, and at the University of Chicago in 1908, and was assistant professor of geography at Yale during 1909-15.

While at Yale Bowman began his travels to South America. His first important field work was in 1907 as leader of the first Yale South American geographical expedition. He was geographer and geologist of the Yale Peruvian expedition in 1911, and in 1913 he was leader of an expedition to the Central Andes under the auspices of the American Geographical Society of New York. In 1915 he resigned his position at Yale University to become director of the American Geographical Society, a post he held for twenty years. During these years Bowman did much to increase the size of the library and the map collection of the society, while its chief publication, the *Geographical Review,* became a leading scientific journal. The chief project of the society during Bowman's administration was the preparation of a map of Hispanic America on a scale of 1:1,000,000, in conformity with the standards of the Millionth Map of the World, sponsored by successive International Geographical Congresses. The preparation of this map cost over four hundred thousand dollars and required twenty years to complete. Two other notable enterprises which he developed were a systematic study of scientific objectives in polar exploration, and a world-wide study of possibilities of land settlement.

Bowman's career in foreign affairs began with his position as geographer for the Peace Conference in Paris following the First World War. In 1919 he was chief territorial specialist to the American Commission to Negotiate Peace; he also served on the Polish Commission, various territorial commissions, and the Polish-Ukrainian Armistice Commission. In 1920 he was physiographer for the United States Department of Justice in the dispute over the Red River boundary between Texas and Oklahoma. An amusing story is told of this period: Bowman seemed too sure of his facts to please the opposing lawyer, who said sarcastically: "May I inquire whether you consider yourself a major or a minor prophet?" Bowman replied: "I am called a major prophet; my name is Isaiah." (*Newsweek,* citing this story in 1944, called Bowman a "prophet without peer in the fields of geography and ethnology.")

Bowman was president of Social Science Abstracts, Inc., in 1929-31; in 1931 he was elected president of the International Geographical Union; and in 1934 he presided at the International Geographical Congress in Warsaw, at which forty nations were represented. He was director in 1933-35 of the Science Advisory Board appointed by President Roosevelt, and a member of the National Advisory Committee on National Parks and Monuments in 1932-36. He was elected a member of the National Academy of Sciences in 1930, and was chairman of the National Research Council in 1933-35.

In 1935 Isaiah Bowman was elected president of Johns Hopkins University to succeed Joseph Sweetman Ames. During the years he has been in office he is said to have proved himself an able administrator, many financial and academic improvements being credited to him. A new department of chemical engineering has been added to the School of Engineering; the work of the Walter Hines Page School of International Relations has been directed to special studies of Far Eastern problems; and "the university's unique tradition—emphasis upon advanced scholarly training and research" —has been fostered in every way possible.

His plans for geography in the postwar years and a delineation of his ideals were given in his annual report to the university (published in *Science* for December 24, 1943). In this report Bowman explained how the war had brought about an awareness of the importance of geography, formerly a neglected field in higher education, because that "imaginative grasp of space" which science shares with poetry had seemed impossible to attain until the United States Army, Navy, and Air Forces were scattered all over the world. Bowman feels that we shall be dealing for a long time to come with what was once considered the "outer world," and that we cannot escape corresponding educational demands. At Johns Hopkins geography was expanded quite suddenly, when the United States entered the Second World War, for the Army Specialized Training Program. Bowman also described the expansion of national research in his report, particularly the development of cartography, and meteorological and climatological research. Emphasis on scholarship has predominated under Bowman's regime; admission standards have been raised and all athletic scholarships eliminated. In 1937 Johns Hopkins became the first major institution in the country to attack the problem of overemphasis on and commercialism in intercollegiate sports; gate receipts in athletic contests have been eliminated, and the university now finances all intercollegiate sports as well as the intramural program.

Many provocative subjects, both national and international in scope, interested geographer Bowman in 1944. He took an active part in the controversy over the administration of the much discussed postwar program for Government-financed education for veterans, expressing the opinion that this program should be administered by educators, not by the Veterans' Administration, and that there should not be too much Federal control of the program. In January Cordell Hull, feeling the need of a reorganization of the State Department, appointed Bowman one of three men on the Advisory Council of Post-War Foreign Policy (the other two members being the late Norman H. Davis '40, chairman of the American Red Cross, and Myron C. Taylor '40, President Roosevelt's special envoy to the Vatican). The newspaper *PM*, commenting editorially on the State Department's "reorganization," pointed out that it was not exactly a "new wind" that had swept the Department but only the "gentlest of zephyrs," since the men appointed had for two years been advising the President, and all represented "pretty conservative thinking." (In December Bowman was appointed one of two special advisers to the new Secretary of State.)

In March Bowman was chosen by Edward R. Stettinius, Jr. '40, then Under-Secretary of State, to go to London for a series of conferences with the British Government. Four other experienced officials, each an expert in his field, accompanied Stettinius on this mission. *Time* Magazine, describing Bowman as a "front-rank political geographer," pointed out that there was a great deal of conjecture among reporters about the probable nature of the conversations. Bowman had helped Woodrow Wilson fix boundaries at the Paris Conference in 1919: Did his presence in the State Department group mean that postwar boundaries would be discussed in London? To these press representatives President Roosevelt replied that Bowman had been chosen because "he knows more about geography than everybody in this room, including myself." Later it was stated that the Stettinius mission had not made any definite decisions, but that it had helped to bring nearer to realization that complete unity of action among the big powers which foreshadowed the Dumbarton Oaks conference. In August 1944 Bowman was a delegate to the World Security Conference at Dumbarton Oaks in Washington, D.C., and in the spring of 1945 he served as one of the advisers to the American delegation at the San Francisco conference.

Bowman's writings and speeches make it clear that he feels that we must not make a failure of any part of the peace, now that the Second World War has come to an end. In a speech given in September 1944 in Cleveland, Ohio, upon his retirement as president of the American Association for the Advancement of Science, he said: "Peace should be the business of every citizen, whatever his calling," and "we must all do something about it, now and hereafter, today and every day, down all the generations together." Of the part of science in the peace he said: "One of the roots of the tree of peace is science. . . .The creative powers of science can quickly make up some of the losses of war." On the question of compulsory military training, he urged the adoption of citizenship courses in the colleges to offset the military training "which inevitably includes indoctrination."

In discussing Bowman's work on territorial matters, *Newsweek* points out that his conception of geography embraces natural history, sociology, political science, and national and international relations, and it surmises that his advisory work on postwar problems has been concerned with "the knottiest geographical riddle that has yet risen to plague Allied relations," the future border of Poland. On the question of boundaries Bowman has said: "If every nation struggles uncompromisingly for the best strategic frontier, there can never be peace. . . .It is not the position of the line alone that is important; it is a whole group of economic, racial, ethnic, and religious factors that relate themselves to boundary location. Religion does not stop at a mountain crest, nor do marriages take account of ethnic majorities. A well-defined topographic feature may be too important to be neglected in favor of the ethnic considerations. The same may be said of any other line of defense, such as a river or a belt of marshes, as in eastern Poland."

Bowman is a director of Woods Hole (Massachusetts) Oceanographic Institution, the American Telephone and Telegraph Company, and a trustee of the Peabody Institute of Baltimore. He received an honorary M.A. degree from Yale University (1921); honorary M.Ed. degree from Michigan State College (1927); honorary Sc.D. degree from Bowdoin College (1931); and LL.D. degrees from Dartmouth, Charleston, and Dickinson colleges and the University of Pennsylvania (1935), University of Wisconsin and Harvard University (1936), Queens University, Ontario, Canada, and the University of Western Ontario (1937), and Washington College (1940). In 1941 he received honorary degrees from the universities of Cusco and Arequipa, Peru.

The university president is a Corresponding Member of the Geographical Society of London, the Swedish Society of Anthropology and Geography, and the Hispanic Society of America, and a member of foreign geographical societies. He is a member of the Association of American Geographers, the American Philosophical Society, the Explorers Club, and Century Association of New York City, and the Cosmos Club of Washington, D.C. He has been the American commissioner of the Permanent International Commission of China and the United States since 1940. He is a member of Sigma Psi (Yale, 1906), Phi Beta Kappa (honorary), Kappa Phi Alpha (Michigan Normal College), Delphi Society (Ferris Institute, 1900-1901). The Council on Foreign Relations of which he is a director is an

BOWMAN, ISAIAH—*Continued*

institution devoted to the study of international relations which was organized by men who attended the Paris Peace Conference in 1919. Early in 1945 the council plans to move into a new building, a mansion donated by Mrs. Harriet Pratt as a memorial to her husband. The directors feel that greatly increased demands will be made on institutions devoted to foreign affairs after the war, and they therefore plan to enlarge the activities of the council after moving into the new building.

Isaiah Bowman is the author of *Forest Physiography* (1911), *South America* (1915), *The Andes of Southern Peru* (1916), *The New World: Problems in Political Geography* (1921), *An American Boundary Dispute* (1923), *Desert Trails of Atacama* (1923), *The Mohammedan World* (1924), *International Relations* (1930), *The Pioneer Fringe* (1931), *Geography in Relation to the Social Sciences* (1934), *Design for Scholarship* (1936), and *Graduate School in American Democracy* (1939). He was co-editor and part author of *Human Geography* and editor and collaborator of *Limits of Land Settlement. The New World*, probably Bowman's most important work, has been a standard political geography text in colleges and universities in the twenty-three years since its publication.

For his services to science Bowman has been awarded gold medals by numerous societies (*Time* Magazine describes him as "many-medaled"), which include the Scottish, Paris, Chicago, and Philadelphia Geographical societies. The Civic Medal of the Geographical Society of Belgrade and the Patron's Gold Medal of the Royal Geographical Society of London were also awarded to him.

Bowman was married in Lynn, Massachusetts, on June 28, 1909, to Cora Olive, daughter of James Walter Goldthwait of Lynn. The Bowmans have three children: Walter Parker, Robert Goldthwait, and Olive (Mrs. Walter H. Gerwig). Judging from his photographs, the geographer is stocky, broad-shouldered, and youthful looking. Though much of his work is scientific, he has combined a sense of beauty and idealism with his fact-finding; in one of his talks at Johns Hopkins he described the inspiration he derived from a book with beautiful engravings which he had picked up on his travels. "Whenever I turn to it," he said, "a magic begins to work. Presently I am on a mountain top, my compass needle points north again, and things big and little appear in true perspective."

BOYCE, WESTRAY BATTLE 1901- Director of the Women's Army Corps

Address: b. c/o War Department, Washington, D.C.

About halfway between V-E and V-J days approximately one hundred thousand members of the United States Women's Army Corps, who had served in every theater of the Second World War, were placed under the direction of Colonel Westray Battle Boyce. A veteran of overseas service, on July 12, 1945, Colonel Boyce replaced Colonel Oveta Culp Hobby '42, who had served as director of the WAC since its organization in 1942. The demobilization of the Corps, after three years of wartime service, was effected on a relative basis with that of the other components of the Army. Meanwhile, the Wacs continued with their regular assignments.

COL. WESTRAY BATTLE BOYCE

Like her predecessor, Westray Battle Boyce is a Southerner. She was born in Rocky Mount, North Carolina, in August 1901. The name Westray and her maiden name, Battle, are six-generation-old family names, and many members on the Battle side have, appropriately, been military men. Educated in her home state, the future WAC director attended the Women's Division of the University of North Carolina in Greensboro and Pell's Law School in Raleigh, but did not take a degree at either institution. For several years she worked in an administrative capacity in the home office of an insurance company in North Carolina's capital city. Then, for eight years the businesswoman worked for Government agencies in Washington, where she became well known. In this period she was employed by the Federal Works Agency and the National Recovery and the Rural Electrification Administrations. In the offices of the REA she served as chief of the Insurance Division.

Less than two months after the Women's Army Auxiliary Corps was created in May 1942, she relinquished this civilian status to enlist in the Corps, because she thought her joining "might make it possible for some father of small children to be able to stay at home." When the first WAAC Training

Center was opened at Fort Des Moines, Iowa, Mrs. Boyce was among the first to enter the Officer Candidates' School. Commissioned a second lieutenant on September 12, 1942, she then served for a period as a company officer at the Training Center.

Her next assignment brought the servicewoman to New York City, where she acted as public relations officer in the Second Service Command for a brief time. Returning afterward to the South, Lieutenant Boyce became WAAC staff director of the Fourth Service Command in Atlanta, Georgia. In this post she was the first woman to serve on the staff of Major General William Bryden, commanding general of the Fourth Service Command. After a year in this position she was sent in August 1943 to the North African theater of operations as WAC staff director. (In early July 1943 President Roosevelt '42 signed Federal legislation making the Corps a part of the Army, thus eliminating "auxiliary" or one of the *A*'s from the name.) As director, Mrs. Boyce, now a captain, was Colonel Hobby's personal representative on the staff of General Dwight D. Eisenhower '42, and in this capacity she supervised the eighteen hundred Wacs in the North African theater. At the end of a year, during which she is said to have served with "special distinction," she was returned to the United States and assigned to the Personnel Division of the War Department General Staff.

A lieutenant colonel by 1945, she was named deputy director of the WAC on May 25, a few weeks after V-E Day. Two months later, on July 12, Lieutenant Colonel Boyce was appointed to succeed Colonel Hobby as WAC director when the latter resigned to devote her time to her family and business affairs. Under-Secretary of War Robert P. Patterson '41 announced the change in WAC command and at the same time pinned the resigning colonel's silver eagles on the shoulders of Westray Battle Boyce. At this ceremony the new WAC chief paid tribute to the retiring director and expressed her own feelings upon assuming command. "It is with great humility that I accept the assignment as director of the Women's Army Corps," Colonel Boyce declared. "I am grateful to the War Department for the confidence it has expressed in me and I shall endeavor to measure up to that confidence." The New York *Herald Tribune* editorially welcomed the appointment of Colonel Boyce to the chief WAC post and took the opportunity to congratulate the entire Corps for its wartime performance. According to this article, "Colonel Westray Battle Boyce appears well equipped in character and experience to carry on the Corps' traditions. . . . We can all be proud of these women and the record they have established. It can be safely predicted that henceforth military service in this country will remain a coeducational enterprise." By V-J Day enlistment of Wacs had been cancelled, and by November 1 the discharge score for enlisted Wacs had been reduced from 44 to 34, and that of officers to 37. In the over-all plan it was expected that by July 1946 the Corps will have been reduced to thirty thousand or less. After V-J Day, in August, it was announced by the Veterans Administration that women veterans would receive the same benefits and preferences as those provided for ex-servicemen. To see to this, a WAC officr, Lieutenant Colonel Mary Agnes Brown, was appointed an adviser to General Omar Bradley '43, VA administrator.

At her first press conference it was reported that Colonel Boyce faced the roomful of reporters with confidence. A small, attractive woman with "an arresting combination of military erectness and Southern gentlewoman charm," she is described by her associates as "the velvet-glove-with-the-iron-hand type, but always feminine and charming." Blue-eyed and prematurely gray, she wears her hair combed high off her forehead. Her favorite reading is historical novels, and she collects silver, antiques, and pictures of her ancestors, which hang on the walls of her home. She also enjoys riding and swimming, and, domestically inclined, she likes to work about the home, sewing, cooking, and housecleaning. Colonel Boyce has one daughter, Westray Battle Boyce, Jr., who in 1945 attended Sweet Briar College.

BOYLE, HAL Feb. 21, 1911- Journalist

Address: b. c/o The Associated Press, 50 Rockefeller Plaza, New York City; h. 110 Waverly Pl., New York City

A few days after the Allied invasion of Normandy in June 1944 General Omar N. Bradley '43, commander of the American invasion forces, held his first press conference. Bradley surveyed the group of correspondents, then asked, "Where's Hal Boyle?" The man about whom the General inquired had been reporting on the war since American soldiers first saw action in the North African campaign in November 1942. As Associated Press correspondent, this reporter followed the war in Europe from the front lines, advancing with the troops and sharing with them many of the dangers of war. He dispatched a steady stream of news from the war zone in his "spot" news reporting and in his feature column *Leaves From a War Correspondent's Notebook*. A favorite of GI's and newsmen alike, he received high praise in many quarters for his coverage of the human side of the fighting. Called the "American infantryman's Boswell," Boyle was awarded the Pulitzer Prize for distinguished correspondence in May 1945, one day before the official V-E Day.

The A.P.'s prize-winning correspondent, whose full name is Harold Vincent Boyle, was born February 21, 1911, to Peter E. and Margaret Boyle of Kansas City, Missouri. His first youthful ambition was to be a civil engineer, but his lack of mathematical ability caused him to change his mind. In high school he directed his studies toward a teaching career; then, after graduation he was attracted to newspaper work. His first job was

HAL BOYLE

with the organization for which he still reports—he was a night office boy in the Kansas City office of the A.P. After a brief period at this work, he left to go to college. He attended the University of Missouri, where, in 1932, he received his degree in journalism, with distinction in English. Awarded a scholarship by the university, he spent the next year doing graduate work in English. He had long wanted to write, although he now says that one of his teachers did not think highly of his literary efforts. Nevertheless he began his journalistic career in earnest, with his former employers, the Associated Press, where he advanced rapidly. He first worked as a reporter in the college town of Columbia, Missouri, writing sports and college news for about a year and a half. He then served successively in the A.P.'s Kansas City office and in the St. Louis office, where he was night editor for a year. His next position was with the New York bureau, where he was night editor at the time of his assignment to the American Expeditionary Force in 1942.

Boyle's career as a war correspondent had a baptism of fire at its very beginning. Landing with the invasion forces on the North African coast in November 1942, he was caught in the barrage of enemy cross fire as he stumbled through the surf toward the Moroccan shore. And Boyle's luck held as the campaign progressed: he pushed forward with the troops, gathering his stories from the fighting men and writing them from the soldier's angle. One day during the Tunisian campaign the reporter leaped into a slit trench as German shells crashed into the earth around him. He was greeted by a grinning soldier: "Come in. I've had all kinds of people in here today, but you're the first newspaper correspondent. What kind of news do you expect to find in a slit trench anyway?" But Boyle found a story wherever he went, and he usually wrote it in a soldier's own words, even adding the GI's name and address. In the first night assault on Sicily in July 1943, Boyle was with the invasion forces again. He accompanied the troops to the beaches of Salerno and onward through Italy. Next, after being detained in England for a period of two weeks, Boyle landed in Normandy on D-Day plus twenty. From that time until V-E Day in May 1945 the correspondent covered the sweep across France and Germany.

According to a fellow reporter, Boyle was "famed along half-a-dozen fronts as the war's hardest working, self-proclaimed loafer." He once toured the Ninth, First, and Third Army fronts, advising A.P. newsmen not to overwork and declaring emphatically, "I'm absolutely through with this business of trying to write a bunch of spot news stories every day in addition to the column. We're just killing ourselves and not doing anybody else any good. . . . I'm a changed man. I'm going to take it easy." After lecturing his colleagues in this manner Boyle proceeded to ignore his own preachments, working practically day and night at the time of the Ardennes break-through in December 1944. During the period the Battle of the Bulge raged, he wrote from five to twelve spot stories a day, quick, eyewitness reports of news events. He visited scores of American outfits engaged in the fighting, filling his reports with the stories of the men he met. Going without much rest or sleep, the A.P. reporter tried to cover two-thirds of the breakthrough singlehanded. He maintained this pace, writing thousands of words daily, it is said, to the exasperation of rival reporters. Bad weather increased the difficulty of the situation, and Boyle now admits that he worked "pretty hard."

During the European campaign Boyle was often with the front-line troops as they entered captured towns, and his reports included accounts of life behind the German lines. Once the journalist hitchhiked four hundred miles to get a battle story. Ironically enough, after surviving the bombs and bullets of the battlefield, Boyle was injured during a military parade. This happened in August 1944 during a parade of American infantrymen down the Champs-Elysées in Paris. The reporter was gathering names in the crowd when a motorcycle policeman lost control of his machine; it spun into the crowd and hit Boyle, who suffered torn back ligaments. He continued his news gathering even on the X-ray table, taking down the names of the doctor and his assistants.

Boyle's human interest stories are considered his best work. He has described soldiers "with neither embellishment nor deprecation." In an issue of the *Quill*, the magazine of Sigma Delta Chi, the journalism fraternity, Boyle expressed his opinion on war reporting: "The terrible daily heroism and sacrifice of these men merely . . . doing the routine duties . . . are too barely sublime to be intensified by the imagination." Thus his column, *Leaves From a War Correspondent's Notebook*, followed closely the real GI pattern in speech and idea. This special A.P. feature was read by millions who were thereby brought closer to their fighting men. Through Boyle's "local" war reporting parents found news of their sons, and many a small town pointed proudly to a local man's name in print. In December 1944 *Newsweek* reported that over four hundred A.P.-

subscribing newspapers were running the Boyle feature column.

His distinguished reporting won him honorable mention in the awards of Sigma Delta Chi in April 1945. In May the trustees of Columbia University awarded Boyle the Pulitzer Prize for his reporting on the war. Informed of the award in Germany, the reporter expressed disbelief, accusing friends of playing a joke on him. "They must have made a mistake," said Boyle even when told again that it was true. A month later Boyle went back to the United States for a six-week furlough; except for one brief period, it was the first time he had been home in more than two years. After this vacation he continued his reporting from the Pacific theater, writing from Tokyo in late 1945 on various aspects of the American occupation of Japan. He was hoping when he returned home to have a "civilian" column, in which he would continue to write about people and perhaps occasionally on political matters.

Boyle is a modest man of simple, direct manner, more interested in writing about people than events. When he met Ernie Pyle '41, a man of similar tastes, on the North African front, the A.P. correspondent greeted him with: "So you're Ernie Pyle? Well, shake hands with Boyle, the poor man's Ernie Pyle." (In *The Story of G.I. Joe* [1945], the filmed story of Ernie Pyle, Boyle played himself along with other well known combat correspondents.) A big, agile man with blond, thinning hair and blue eyes, Boyle has "a prize fighter's face and a poet's soul." Riding to the front lines, he read the poetry of Emily Dickinson, whom he ranks "a shade below Shakespeare." (He collects early editions of Miss Dickinson's works.) The journalist's wife is the former Frances Young, to whom he was married on November 6, 1937. Their New York apartment, which also houses a cocker spaniel appropriately named Pencil, overflows with a variety of mementos collected by Boyle during his travels: brass, leather, and silver from Africa; books, bric-a-brac, and antique silver from London; chinaware from France; and laces from Belgium. Reporter friends relate with relish stories of shopping tours with Boyle in liberated towns, adding that "Boyle needed an extra jeep just for his gear."

Endowed with a hearty sense of humor, Boyle has been a continual source of amusement to troops and correspondents. One of his famous pranks had its setting in an African village which Boyle entered with the invading troops. The reporter addressed the cheering natives until they were enthusiastically repeating his words. The result of his oratory was heard a few days later when American officers entered the village—to be greeted by natives shouting, "Vote for Boyle, the son of toil. Honest Hal, the Arab's pal."

BOYLE, HAROLD VINCENT *See* Boyle, H.

BRADEN, SPRUILLE (brā'dĕn sprōō'ĭl) Mar. 13, 1894- United States Government official; diplomat

Address: b. c/o Department of State, Washington, D.C.

The man regarded as a symbol of militant democracy in South America is a Montana-born mining engineer, businessman, and diplomat who became Assistant Secretary of State in charge of Latin American affairs, at a time when the "Good Neighbor Policy needed a real instrument." Spruille Braden, appointed August 25, 1945, by President Truman '45 to succeed Nelson Rockefeller '41, is a diplomat who believes that frankness and fundamental honesty are the most effective and constructive instruments of diplomacy.

Spruille Braden apparently inherited his taste for the profession of engineering in which he earned early success. He was born March 13, 1894, in the mining town of Elkhorn, Montana, the son of William and Mary (Kimball) Braden. His father, who was associated with mining interests both in the West and in South America, founded the Braden Copper Company, a company which was later to be the indirect means of precipitating a major crisis in the son's diplomatic career. Young Braden obtained some practical experience in the mines before he entered Sheffield Scientific School, Yale University, and he spent vacations acquiring further knowledge in various concentrating and smelting plants as well as in mining camps.

Braden's work in South America began soon after his graduation in 1914, with a Ph.B. degree in mining engineering. For the five years that followed he occupied positions of growing responsibility: engineer and assistant to the general manager of Andes Exploration Company, 1914-16; acting manager of that company and of Santiago Mining Company, as well as general manager in South America of Anaconda Copper Mining Company interests, 1916-19; president and director of the Bolivia-Argentina Exploration Corporation, and associate-resident director of Errazuris, Simpson & Company, 1919.

During the First World War Braden's activities included the presidency of the American Red Cross Society of Chile. He was a member of the Inter-Allied Commercial Committee and Inter-Allied Central Committee for Chile, as well as president of the American Society of Chile. For a half-dozen years after the Armistice he was adviser to several South American governments in the negotiation of loans. He obtained a contract for Westinghouse Electric for electrification of Chilean state railways. In the United States he acquired control of the Monmouth Rug Mills at Englishtown, New Jersey, developed them into a prosperous business, and also became an official in other large industries. Throughout these years he was called into financial conferences, as a delegate to the Second Pan-American Financial Conference in 1920, and the Pan-American Commercial Conference at Buenos Aires in 1935. In 1932 he organized the Rehabilitation Corporation, financing income-producing properties.

Braden entered the diplomatic service as a delegate to the Inter-American Conference of

SPRUILLE BRADEN

American States in Montevideo in 1933. Later he played an important role in allaying the smoldering conflict between Paraguay and Bolivia, as chairman from 1935 to 1938 of the American delegation, with rank of ambassador, to the Chaco Peace Conference. In the latter year, President Roosevelt '42 appointed the forty-four-year-old financier United States Minister to Colombia. There Braden carried on an extensive investigation of Nazi activities during the early years of the Second World War, and short-circuited Nazi designs on the Panama Canal from air bases in Colombia. Shortly after Pearl Harbor he was nominated, on December 20, 1941, to be Ambassador to Cuba, where he presented his credentials with the following remarks: "Now we are allies in a great adventure to preserve the principles of liberty, justice, decency, and dignity for free nations and free men, irrespective of their size, wealth, or strength. . . .Under a test by fire the ideas of inter-American solidarity once again are being converted into effective cooperation for the benefit of all concerned and of civilization itself."

In these first important posts Braden is considered to have displayed qualities of statesmanship which identify him as outstanding among crusading democratic ambassadors. In Cuba he was influential in speeding the building of the gigantic Nicaro nickel-extraction plant. Begun in a jungle in 1942, this thirty-three-million-dollar Government project has produced enough nickel oxide to provide the United States with almost 10 per cent of its wartime nickel, which goes into heat-resistant steel for armor plate, gun forgings, and aviation engines. In addition, in the words of a report on the building of Nicaro (*Fortune*, July 1945), "He got the Cubans to run one American out of the country in handcuffs for corrupt practices and battled militantly against the ancient practice of United States firms of donating to Cuban Presidential campaign funds. Throughout Nicaro's building, the Ambassador publicized among Cubans America's interest in quick production."

Speaking for the American Chamber of Commerce of Cuba, in April 1943, Ambassador Braden declared, "The principles of the Good Neighbor Policy are accepted and put into practice by an immense majority of our fellow citizens with conviction and enthusiasm. This policy has come to stay. . . .No change in administration in our country will entail abandonment or neglect of the fundamental principles which now govern our relations with American nations." Inevitably there was certain opposition to Braden's attempts to put his policies into practice. In 1944 he was the storm center of a newspaper controversy in Havana, in the course of which a duel was fought in his defense. Eugenio de Sosa, Jr., director of Cuba's oldest newspaper, *Diario de la Marina,* charged that Braden sought to interfere with Cuban freedom of the press by opposing the newspaper's campaign for higher sugar prices. Sosa's attack resulted in a duel fought by Sosa and Guillermo Belt, a supporter of Braden in Havana.

What lay ahead for Braden became evident soon after President Truman nominated him to be Ambassador to Argentina in May 1945. In order of urgency, the first point to be established in any study of Argentina, a present festering spot of trouble for the United Nations, is the position of the present Argentine regime in the world-wide struggle against fascism. In the words of Roland Hall Sharp in the *Christian Science Monitor*, "The record speaks for itself. Argentina's Conservative and military dictatorship has steadily become more Fascist even while the cause of world democracy gained. The background of the crisis needs to be understood. On the stage of internal Argentine affairs, an economic and social revolution has been under way ever since the growth of industries and a middle class began to challenge the traditional wealth and privilege of the land-owning agricultural producers. . . . The new military rulers abolished Congress, decreed the dissolution of all political parties, choked the free press, arrested more than two thousand democrats and pro-Allied leaders, 'purged' the schools of independent professors, and began to militarize the nation. Nevertheless, Argentine public opinion stood in the preponderant majority with the Allies. . . .Such is the divorce between the Argentine people and the regime nominally headed by General Edelmiro J. Farrell, but actually controlled by Vice-President and War Minister Juan D. Perón '44 and other Fascist officers."

In 1944 the United States had set up economic restrictions against Argentina, but these were removed in April 1945, after Argentina officially returned to the family of American nations by declaring war on the Axis, and by signing the Act of Chapultepec. Although her declaration of war gained Argentina's delayed admittance to the San Francisco conference, reports show that the Government used the state of war as an excuse to class every opposition to the Farrell-Perón regime as treason, and to intensify repression and censorship.

Before his departure for Argentina in May, Ambassador Braden said, "The Good Neighbor Policy is one of respect which begins with self-respect and then mutual respect. It is a two-way, not a one-way street to be traveled in dignity by both parties in full realization that they have rights and responsibilities. . . .I am not going to Argentina to re-establish friendly relations, but to establish new ones!" Proceeding to put these words into practice, according to an account in *Inter-American,* July 1945, "the day after he presented his credentials to the *Casa Rosada,* Ambassador Braden flatly told newspapermen that the United States would like to see democratic governments everywhere, and that recognition of Argentina was dictated by necessity alone. On May 29 it was announced that there would be no arms shipments to Argentina because of her failure to carry out the democratic terms of the Chapultepec declaration."

In the first months after he took his post Braden's investigations revealed that Nazis still held directorships in many Argentine firms. On June 20, 1945, according to a report in *PM,* "the American correspondents had complained to Ambassador Braden about the increasing censorship difficulties which were keeping them from telling the outside world what was really going on. The complaint was the straw that broke the back of Braden's patience. He picked up a telephone, known to be tapped, and dictated a cable to his secretary at his office, instructing him to dispatch it in plain language for all to read. The cable suggested to Washington that he, Braden, should be recalled, and the United States policy in regard to Argentina be revised, as Argentina was not fulfilling her Mexico City and San Francisco agreements. Within an hour Oscar Lumoto, Under-Secretary of Press and Propaganda, was at Braden's home, assuring him that complete freedom of the press, especially for foreign correspondents, was guaranteed in Argentina, and that instructions to that effect had been given by Perón."

While Braden's campaign for democracy thus brought results, the extreme nationalists counterattacked in a smear campaign. Posters appeared in Buenos Aires, denouncing Braden and attempting to connect his name with the death of some five hundred Chilean miners in a recent fire in the El Teniente mine of the Braden Copper Company in Chile. Although the latter company was founded by the Ambassador's father, another company bought it some years ago, and Braden was not connected with it. The attacks were considered by observers to be the result of official concern over the growing popular demand for democratic government in Argentina. Braden stated: "The campaign . . . against my country and me personally was apparently institgated by foreign Nazi elements totally alien to the truly noble feelings of the Argentine people."

Following the surrender of Japan in mid-August, new riots flared for four days between victory celebrants and pro-Government crowds. Then Braden, further denouncing Fascist regimes at a thanksgiving service held by the American community, said, "The peoples of the world have learned that Fascist militarists . . . will stop at nothing. . . .To defeat them we have paid a staggering price. . . .We shall not forget this lesson merely because petty tyrants are now assuming the disguise of spurious democracy. No longer can a self-respecting world . . . accept a government that rules through violence."

When President Truman ten days later named Ambassador Braden as Assistant Secretary of State in charge of American Republic Affairs, Secretary of State Byrnes '41 immediately announced that it would be Braden's duty to carry on "with unremitting vigor" the policies which he has "so courageously sponsored" in Argentina. At a farewell luncheon given Braden by Argentine and American cultural institutes, the new Assistant Secretary of State said, "Let no one imagine that my being transferred to Washington means the abandonment of the task I have undertaken. The voice of freedom makes itself heard in this land, and I do not believe anyone will succeed in drowning it. I shall hear it from Washington with the same clarity with which I hear it in Buenos Aires. . . .If, during my stay among you, I have faithfully reflected the feeling of the United States people, which is not different from that of their Government, I hope when I am in Washington to be able to interpret with equal fidelity the sentiment of the people of the Argentine Republic."

In the weeks before his departure for home the Ambassador stated that there were two conditions for a settlement of differences between his country and Argentina—complete elimination of Axis activities and restoration of democracy in Argentina. Shortly after this disclosure the Argentine Government made what one commentator called "an unabashed attempt to avert another rupture in relations with the United States and other American republics." First, a number of "belated" anti-Axis measures were adopted; later, in reply to accusations made by Nelson Rockefeller, a thirty-page document was released which undertook to show that Argentina was fulfilling her commitments under the Act of Chapultepec. (Braden rejected this document, stating that except for "one of the neutral countries adjacent to the struggle, there is no country in the world where the Nazis find themselves in such a strong position as they do in Argentina.") Braden himself received an apology from the Foreign Minister, Juan I. Cooke, for attacks made on him by the Argentine press.

In the wake of an abortive democratic uprising three days after Braden's departure, a state of siege was reimposed by the Farrell-Perón regime; all civil liberties were again suspended and press censorship was restored. On September 29 the State Department stated that it planned to continue the policy of nonintervention in Argentina, but to step up its campaign of moral pressure against its Government. Shortly afterward the Department announced the indefinite postponement of the Inter-American Conference on Peace and Security which had been scheduled for October 20, a move said to have been inspired by Braden.

Braden did not take the oath of office as Assistant Secretary of State for Latin American Affairs until October 29, two months after his nomination to that post, his confirmation having been held up in the Senate Foreign Relations Committee because of what some Senators saw as "meddling in Argentina's internal affairs." Braden denied that he was intervening in that country's domestic affairs, telling his critics that he had simply put an end to the

BRADEN, SPRUILLE—*Continued*

negative policy of silent acquiescence. Other Senators regarded Braden as a symbol of American desires for the introduction of democratic elements into Argentina. In one of the first speeches Braden made after taking his State Department post (at the National Foreign Trade Convention in mid-November), he again spoke his views on Argentina. United States, he said, would come to the aid of those democratic elements by "whatever means it had at its disposal," a statement on which he did not elaborate at the time. He also spoke strongly against the use of economic sanctions to bring pressure on Latin American neighbors. Of Braden's coming to Washington the *United States News* commentator wrote: "Mr. Braden is something new in the upper reaches of the State Department. He will be a much-watched and controversial figure for some time to come."

Described as big, jolly, and energetic, Braden finds recreation in swimming and playing handball with cronies. His exercise was more strenuous in college, where he played football and water polo. Collecting antique hand-wrought South American silver and rare books are now his favorite hobbies. In 1915 he was married to a prominent Chilean physician's daughter, Maria Humeres Solar. Their children are Maruja, Laurita, Isolina, William 2d, Patricia, and Spruille.

BRICKELL, (HENRY) HERSCHEL (brĭk'ĕl hûr'shĕl) Sept. 13, 1889- Editor; United States Government official

Address: b. c/o Department of State, Washington, D.C.; h. Ridgefield, Conn.

Since 1940 Herschel Brickell has been editor of the *O. Henry Memorial Prize Short Stories* series, an annual collection chosen from short stories published in the United States. Also assistant chief of the State Department's Division of Cultural Cooperation, in charge of the Latin American branch, and former cultural envoy to Colombia, Brickell has been journalist, book critic, essayist, and literary talent scout.

A native of Mississippi, Henry Herschel Brickell was born on the thirteenth of September, 1889, to Henry Hampton and Lula Johns (Harrison) Brickell. Herschel, as he was called, grew up in Yazoo City, where there was a good library: "When I wasn't going to school, riding horseback, or falling off a bicycle," he writes, "I was reading. I read a book a day in summer vacation time, sometimes two, thus preparing myself unwittingly for the life of a daily book columnist in New York." In 1906 the tall, slender youth entered the University of Mississippi, where for four years he did well in English courses and was active on the campus newspaper and literary magazine. However, as he says himself, he "flunked mathematics with perfect regularity," and therefore did not graduate with his class.

Brickell began his post-college life as reporter and sports writer for the Montgomery (Alabama) *Advertiser*, in which capacity, he says, he did very badly. At the end of four years, working on that and other Southern papers, he had risen to the editorship of a paper in Pensacola, Florida—and as editor he was rated good. For a few months in 1916, at the time of the Mexican border expedition, he served with the First Alabama State Guard as a battalion sergeant major; when Army food disagreed with him he was, as he expresses it, "sent home to die." He returned to Mississippi, as the medical authorities had ordered, but immediately went to work for the Jackson *Daily News*. For the next three years, while holding the position of editor, he subsisted on "Greek-made lemon pie and other Athenian delicacies beloved of newspapermen." In March 1918 he was married to Norma Long of Jackson, a pianist, who gave up her career of music to watch over her husband's diet.

Since Brickell now wanted to try for a job on a big metropolitan newspaper, the young couple moved to New York the year after their marriage. There the Southerner obtained a job as copyreader with the *Evening Post*, a position which he held until 1923. At this time he was made book columnist of the *Post*, and at intervals for twelve years he wrote the daily column *Books on Our Table*. In addition he contributed articles on literary subjects to several magazines. He left the paper in 1928 to become the general editor of the New York publishing firm of Henry Holt and Company. During the five years he remained with Holt he took courses at Columbia University, spent a considerable amount of time abroad in search of literary talent, and, on one of his trips, studied at the University of Santander in Spain. Spain, he says, Mrs. Brickell and he "loved beyond any country," and there they spent all their vacations. During this period Brickell also wrote reviews for the New York *Times* and the New York *Herald Tribune*, and for eight years contributed monthly essays to the *North American Review* under the title of *The Literary Landscape.*

In January 1934 Brickell resumed his column in the *Post*, becoming literary editor shortly after his return. He left the paper again in 1938, and that summer was one of the lecturers at the Bread Loaf (Vermont) Writers' Conference. He has since lectured at the writers' conferences of the University of New Hampshire and of the Blowing Rock (North Carolina) Summer School of English. In 1939, with the aid of a Julius Rosenwald Foundation award, he did research into the history of Natchez, Mississippi, and that same year received a Guggenheim fellowship for work on a book on Spain. The first project, Brickell reports, is "under way like a glacier," and the second "will have to wait for a happier time to get itself written." He has, however, written several articles for *Publisher's Weekly* on the modern literature of Spain, and has compiled a bibliography on the Spanish civil war.

The writer took up new duties in the field of criticism in 1940, when he assumed the editorship of the *O. Henry Memorial Prize Short Stories* series. (Muriel Fuller of Thomas Nelson and Sons, the New York publishers, became his assistant.) The plan for the anthologies, which are annual collections of stories selected from among those published in American magazines in a given year, originated with the New York Society of Arts and Sciences in 1918. The purpose was to "honor and preserve the memory of the master of the brief narrative, whose world-famous pseudonym is a part of the title." The first volume, edited by Blanche Colton William, appeared in 1920. Originally two prizes were awarded, for the two best stories of the year; in 1937 three awards were given; and when Brickell became editor the policy of awarding a fourth prize for the best first effort of an author was begun.

The critics' inspection of the first volume to appear under Brickell's editorship (1941) evoked favorable comments. The *New Yorker* reviewer wrote that the collection was "a much-better-than-average lot," and Milton Hindus observed that Brickell had "performed admirably his first job of editing" the story collection. In his introduction the editor stated that, although he believed the brief narrative must be entertaining and exciting, he attached "great value to originality in theme and treatment, and to style, which seems [to him] of supreme importance. . . .The very nature of the short story demands the best qualities of writing." (With the appearance of the 1945 volume of prize stories, Brickell himself said he believed it was the best to be published under his supervision.)

While continuing as editor of the *O. Henry* anthologies, Brickell in October 1941 assumed the duties of the newly created State Department post of senior cultural relations assistant to Spruille Braden '45, who was then Ambassador to Colombia. His post, Brickell told reporters, was to "foment any kind of cultural work and to get things really started." During the two years he remained in Bogotá he helped to introduce American methods into Colombian libraries, to arrange for the interchange and translation of the books of the two countries, and to effect the opening of several free libraries. He believes that the progress made in the library field "will form a solid foundation . . . in the cultural interchange," since books are "cultural capsules."

In 1943 Brickell left his Colombian post for a position in Washington, D.C., as head of the Exchange of Persons Unit. When the division was later reorganized and its work divided into four geographical branches (European, Far Eastern, Near Eastern and African, and American Republic), he became the assistant chief of the Division of Cultural Cooperation, in charge of the Latin American branch. His responsibilities include formulating policies designed to encourage cultural contacts between the United States and Latin America through the exchange of students and experts in various fields, cooperating with private and Government agencies engaged in student and training programs, and aiding programs of a reciprocal nature in the intellectual, cultural, and technical fields.

HERSCHEL BRICKELL

Brickell has contributed numerous articles on Latin American subjects to a variety of magazines in the United States, and has had a collection of essays and speeches published in Colombia, *Cosecha Colombiana* ("Colombian Harvest"). Several of his articles on library methods and on changes instituted in Latin American libraries appeared in *Publisher's Weekly* in 1942; and "Medillin, Valley Capital" and "Up to Manizales" are among the travelogues that were published (1943-45) in *Inter-American* and other periodicals. In 1945 Brickell wrote the Colombian and Venezuelan chapters for *What the South Americans Think of Us.* Harry Hansen '42, in reviewing the book in the New York *World-Telegram*, said that Brickell wrote his chapters with "judicial fairness—but then he is an employee of the State Department." Hansen added that Brickell is "the only contributor who feels that the Good Neighbor Policy will pay if continued." Working with Carlos Videla, Brickell translated Ricardo Rojas' *San Martin, el Santo de la Espada*, which was published in 1945 with the title *San Martín, Knight of the Andes.* He also contributed to the American literature survey of the *Encyclopædia Britannica Yearbook.*

The Brickells own a small house in Ridgefield, Connecticut, and have undertaken the "lifetime occupation" of doing it over. When they are in residence there they devote much of their time to gardening, especially to the growing of herbs. Another hobby is the raising of cats, their collection at one time numbering seventeen. In Bogotá Brickell's favorite pet was a black part-Persian named Federica García Lorca Uribe White Brickell after the Spanish poet Lorca, a close friend of the envoy's, and after White, director of the national library in Bogotá, whose black cats are famous. All in all, the Brickells know many amazing cat stories, all about their own felines, which Brickell claims were most remarkable.

BROWN, JOE E(VAN) July 28, 1892- Actor

Address: b. c/o Russell Birdwell & Assocs., 200 S. Beverly Dr., Beverly Hills, Calif., h. 18 Oakmont, West Los Angeles, Calif.

The veteran entertainer Joe E. Brown can trace his appearances in the spotlight back through motion pictures, the theater, and burlesque to the circus, where he was an acrobat at the age of nine. Since the middle 1920's he has been a Hollywood figure famous on the screen for his wide-mouthed grin, his laugh, and other comedic qualities. During the Second World War he brought these morale-building talents to troops on the remotest fighting fronts.

Joe Evan Brown was born in Holgate, Ohio, July 28, 1892, the fourth of seven children. His father, Matthias Brown, was a house painter who worked hard to support his family on wages of from a dollar and a half to two dollars a day, and his mother, Anna (Evans) Brown, often had great difficulty making ends meet. It was not strange, therefore, that at the age of nine Joe was eager to earn some money himself. At that time the Browns were living in a two-family house in Toledo, and the neighbor's child, a boy about Joe's age, had got a job in an acrobatic act. When the act needed another boy, the neighbor thought of Joe, whereupon the nine-year-old was given a trial. In displaying his skill at back handsprings and somersaults, Joe slipped and cut his hand in a pile of cinders, but he got up and tried again. "O.K., kid," the leader said. "If you had quit I wouldn't have taken you." The act Joe went into was called The Five Marvelous Ashtons, and he found himself one of three boy marvels who were tossed back and forth forty feet in the air by two men. The act joined the Sells and Downs show in Kansas, and for four summers Joe Brown played circuses or county fairs with the act, returning home each fall to attend school until he had finished the eighth grade. By that time he was earning seven and one-half dollars a week.

In 1906 the troupe disbanded. The acrobats were playing San Francisco at the time, and Joe landed a job there with a vaudeville acrobatic act called the Bell and Prevost Troupe. Frank Prevost, though much older than Joe, became the lad's good friend, and one night when Joe was injured "Pre" said he would drop out of the act with him. Thus began an eleven-year association known as Prevost and Brown, with Joe the funnyman of the team. They often made as much as three hundred dollars a week—some weeks.

Brown has described his career as an acrobat as "thirteen years of merry hell . . . a glorious dream and a horrible nightmare mixed together." At first his only ambition was to be with a circus. The circus had got into his blood, and, no matter what happened to him, he has since said, "the glorious moments when I felt like a god, high up, whirling through space, more than paid for the pain—and there was pain, cruel pain." In those days child entertainers were not protected by law. Injuries were taken as a matter of course—practically nothing short of a broken leg kept a boy out of an act. In his first performance Joe fell and cracked his jaw. For weeks he wore a sort of helmet to hold the jaw in place.

During the course of other performances he suffered sprained ankles, dislocated knees and shoulders, breaks in legs and fingers, and a snapped muscle in the calf of one leg. Every time he made a mistake he was punished—on the theory that this was the only way to train a boy. But when the young acrobat wrote to his parents he filled his letters only with accounts of his "triumphs" as "The Corkscrew Kid," never mentioning his hardships for fear of being made to leave the circus. His employers did teach him one thing, he says, that has helped him all his life. They never let him admit he was defeated.

Brown has always had a great enthusiasm for sports, especially baseball. He tried professional baseball and at seventeen was good enough to play with the St. Paul team. One spring he was actually taken south by the Yankees. He has explained why he did not stay on with the game he loved: "I had two idols at the time, Ty Cobb and William Jennings Bryan. Naturally, I tried to play baseball like Ty Cobb, but actually I played it like Bryan." (He is reported to have a photographic memory for baseball events.)

While Joe Brown was still in vaudeville he met his future wife, Kathryn Frances McGraw. One day in Duluth she stepped into the theater where he was appearing and heard him tell his now famous "Lil' Mousie" story. Miss McGraw thought it an extremely funny one and relayed it to her family. A few months later, when the entertainer was making a long jump to the West Coast, a pleasant, middle-aged woman sitting next to him on the train asked him whether he was the Joe E. Brown who told the "Lil' Mousie" story in vaudeville. He said he was, of course, and later he was introduced to her daughter. This meeting was the beginning of the couple's courtship, which ended in marriage in December 1915. Brown says they have quarreled just enough during their married life to make things lively; his wife says no woman ever had a more devoted or perfect husband. They celebrated their twenty-fifth anniversary in 1940 with another ceremony, their four children acting as attendants.

About a year after the Browns' marriage Joe felt he must take stock of himself. As an acrobat in vaudeville he had gone about as far as he could. As a comedian in burlesque he would have to start with less money, but, if he were successful, there was a chance he might be put into a Broadway musical. Encouraged by his wife, he made the break with his old life. He had to start at the bottom, and the best job he could get was in a burlesque show at seventy-five dollars a week. The Browns' first child, Don Evan, was born on Christmas Day, 1916, while the twenty-four-year-old father was in Boston giving his first performance as a comedian. In 1918 a second boy, Joe LeRoy, arrived. And the next year Joe E. Brown finally got his chance in a musical comedy, when he was added to the cast of

Listen, Lester. This was followed by more parts—in *Jim Jam Jems* in 1920, two editions of the *Greenwich Village Follies* (1921-23), *Betty Lee* (1924), *Captain Jinks* (1925), and *Twinkle, Twinkle* (1926), with vaudeville engagements between shows. It was while playing in the 1926 show in Los Angeles that Brown was offered a contract in motion pictures.

Touring in vaudeville and musical comedy did not offer much opportunity for the home life the Browns wanted. Kathryn and Joe Brown lived in hotels, and the boys went to boarding schools. In 1927, therefore, the comedian and his family settled in Hollywood and he began his film career. His first leading role in silent pictures was in *Crooks Can't Win* (1928). But it was the "talkies" that really gave Brown his chance on the screen, and audiences the opportunity to hear his famous roar. His first leading role in talking pictures was in *Painted Faces* (1930). *Going Wild* (1931) was his first solo starring vehicle. These were followed soon by such films as *Local Boy Makes Good* (1931), *Fireman, Save My Child* (1932), *You Said a Mouthful* (1932), *The Tenderfoot* (1932), *Elmer the Great* (1933), *Six Day Bike Rider* (1934), *The Circus Clown* (1934), *Alibi Ike* (1935), *Maybe It's Love* (1935). As Frederick L. Collins says in an article in *Liberty* Magazine, the wide-mouthed comedian was "sitting pretty on Hollywood's highest comedy roost." More recent pictures include *A Midsummer Night's Dream* (1935), *Sons o' Guns* (1936), *The Gladiator* (1938), *$10,000 a Touchdown* (1939), *Shut My Big Mouth* (1942).

Shortly after Joe E. Brown became established in Hollywood, his third child, Mary Elizabeth Ann, was born (in 1930), and four years later he and his wife adopted a girl and named her Kathryn Frances after Mrs. Brown. The boys went to public school first, then to Urban Military Academy in Los Angeles. After that they attended the Beverly Hills High School. When Don wanted to postpone his entering college a year to take a trip to China (his parents had just returned from one), the Browns heartily approved, on the condition that the young man earn his own way. He did this, as a cadet or bellboy on the boat, making the trip twice and saving a goodly sum of money out of his earnings. He then went to the University of California at Los Angeles. His younger brother spent a year at Mercersburg, an Eastern preparatory school, then he too entered U.C.L.A. The allowances of both Don and Joe were always small, but there was always money saved. The Browns were proud of their sons, for they were fine athletes—their father had passed on to them his enthusiasm for sports—and good students. Like their father, too, neither smoked nor drank. No college man himself, Brown is athletic patron of his sons' university. He donates equipment to the football team, awards an annual loving cup to an outstanding player, frequently presides over athletic banquets. In 1938 he was initiated as a regular member of Zeta Phi, to which his sons belong, and he is the only nonstudent ever to get a letter from U.C.L.A. One of the finest athletes in U.C.L.A. history, Mike Frankovich, has been "adopted" by the Brown family.

JOE E. BROWN

Early in 1940 Brown narrowly escaped death in an automobile accident in which his back was broken. After spending six months in a plaster cast, he was able to act again. In August 1940, at the Cape Playhouse in Dennis, Massachusetts, he was starred in a revival of *Elmer the Great*, the Cohan and Lardner farce about a rookie baseball pitcher in which he had already played successfully, both on stage and screen. The role was a "natural" for the former acrobat-baseball player. Besides having played the game himself and having supported it as a fan, while at Warner Brothers ['45] the actor had organized and coached a semipro studio ball team and had seen to it in his contract that all the players would be kept on the payroll as long as he was. (Brown had once been under long-term contract to the Warners, but recently worked under a three-picture-a-year arrangement with the independent producer David Loew.)

In 1941 a soldier in Alaska wrote to the actor to tell that servicemen overseas were lonesome for a familiar face. This letter started Brown off on his now famous trips to the theaters of war. On his own initiative, in February 1941 he went to Alaska. He was the first and only entertainer the soldiers had seen for many months, and their welcome convinced him of the need for more of this sort of morale-building. He stayed until April, making a thirty-three-day tour of camps, outposts, gun positions, and bases—the first Hollywood star to visit the barren wastes of Alaska and the Aleutians. To let him know how much his visit meant to them, the citizens of the tiny town of Gambell proclaimed March 17 (the day of his arrival) Joe E. Brown Day and a holiday thenceforth. Brown's will stipulates that his children must carry on the tradition by sending greetings in his name each March 17 to the citizens of Gambell. On his return from the Aleutians, the actor toured in a revival of *The Show-off* and appeared at War Bond rallies.

In January 1942 Brown left for the South Pacific. That trip lasted four months, took him everywhere it was possible to get an actor who

BROWN, JOE E.—*Continued*

was determined to bring a laugh to every serviceman he could reach. *Newsweek* Magazine reports there is even a Joe E. Brown Hill out there—"so named because the homely little comedian insisted on giving a show for four men out on the hill on patrol."

On October 19, 1942, Captain Don E. Brown was killed while on duty in the crash of an Army bomber near Palm Springs, California. After the funeral Brown threw himself wholeheartedly into a three months' entertainment tour for the men in service as a sort of memorial to his son. In April 1943, returning from the Pacific fifteen pounds lighter, his hair turned iron gray, he headed for his Hollywood home and a rest before leaving again for Alaska. He had been in the steaming jungles of New Guinea, the remotest Allied outposts in the South Pacific, and everywhere he had been impressed by the deep need for entertainment for the men. "Even when they couldn't hear me, they'd laugh," he reported. The participation in games by the men themselves he felt to be important, too. The sight of only one deck of playing cards in a base hospital in the Pacific had led him to establish the All-Pacific Recreation Fund, which supplies athletic equipment and games to servicemen in the various theaters of war.

In May 1943 Metro-Goldwyn-Mayer signed Brown to a contract, but in November he was off to entertain the men in service. This time he went to China-Burma-India and again was the first film entertainer to reach the servicemen in a distant war sector. The USO arranged for his trip, but he paid his own expenses. He went to India, Iran, Iraq, Arabia, Egypt, Italy, and North Africa—two hundred and two shows in all. On his return in February 1944 the "favorite pin-up boy of the Army," veteran of more than one hundred and fifty thousand miles of hazardous flying to the battlefronts, said there would be no more trips for a while because his family "insisted on eating." After an official reception in New York City under the auspices of Mayor La Guardia '40 and a dinner at the White House, at which he was the guest of honor, the traveling actor returned to Hollywood to do some picture work—*Casanova in Burlesque, Pin-up Girl*—and a radio quiz show over the Blue Network, *Stop or Go*, which went off the air in February 1945 after a year's run.

In October 1944 Brown's report of his travels appeared in print, as *Your Kids and Mine.* Reviewers called his "odyssey" a "little classic of World War II," and recommended it to civilians and GI's alike. Many agreed that, though Brown could not possibly have known when he wrote this report that he would be attacked by an Army paper for "running out" on the CBI area, the book constitutes a perfect defense and a "terrific tribute to our GI's and incidentally to Brown himself." L. L. Marchand said: "It is no literary epic . . . but he has dipped his pen in sincerity, even if with some sentimentality." In November, in celebration of his forty-fourth year in show business, the new author's life story was broadcast over WOR. Perhaps his philosophy has been epitomized in these words: "The three R's are all right in their way, but the three L's—Love, Learn, and Laugh—are righter, especially right now. What we need to stop war is a crusade against hate—a crusade of laughter."

In April 1945 he left the United States again for a ten-week tour of the Pacific battlefronts, traveling thirty-eight thousand miles. In October Brown received the United States Army's highest award for a civilian, the Bronze Star, in recognition of his services as a civilian volunteer with the USO. Presented with the award at a surprise ceremony in Chicago, the comedian was deeply moved, but managed to say, "You are now seeing the raw edges of Joe E. Brown." The second civilian to be so honored by the War Department (the late Ernie Pyle '41 was the first), Brown gave his Bronze Star to his wife, to wear beneath the Gold Star she wears for their son. Late in October 1945 Brock Pemberton '45 announced that Brown had been signed to play the lead in the road company of the Pulitzer Prize comedy, *Harvey.* He will play Elwood P. Dowd, first enacted by Frank Fay '45, in the Mary Chase '45 Broadway success.

Joe E. Brown's screen popularity with children has long been second only to Shirley Temple's '45. He is humble about his professional success, impressed rather with his responsibility than with his importance. He wants to be an all-round comedian and is "a little miffed" at times, as he expresses it, by studio emphasis on the size of his mouth. "I've seen a lot of funny looking people who were not comedians," he says. In a *New Yorker* profile of the actor, Alva Johnston pointed out that Brown's large mouth didn't make him famous—"Joe made the mouth famous." According to this writer, the comedian discovered his "million-dollar mouth" some twenty-five years ago while trying to enliven a dull scene he was playing. "Joe hit on the idea of opening his mouth as wide as possible and holding it that way until the audience was staring at it wtih concentrated attention, believing he had forgotten his lines and was petrified with fear. When he had perfect attention, he barely whispered his line."

Besides belonging to the Los Angeles High School Alumni Association as an honorary member, and to the Blue "C" Society of U.C.L.A., the actor is a Mason (Shriner) and an Elk. He also belongs to clubs in California and New York. His hobby is collecting sporting trophies, among which are the gloves Dempsey '45 used when he knocked out Willard, and the bat Babe Ruth '44 used when he knocked out his sixtieth home run in one particular season.

BRUNNER, JEAN ADAM (brŭn'ẽr jĕn) Oct. 31, 1893- Veterans' leader

Address: h. 99-43 Sixty-sixth Ave., Forest Hills, Long Island, N.Y.

Allied victory in Europe and the Pacific brought into sharp focus the problem of the returning veterans, and with it consideration of the various organizations which represent their interests. Among the most important of these organizations is the Veterans of Foreign Wars of the United States, whose membership is composed of veterans of the Spanish-American War and the two great wars. Jean Adam Brunner, its commander in chief from August 1944 to October 1945, in speaking of the inadequate legislation and provisions for veterans at the end of the 1914-1918 conflict, in which he served, has expressed his and his organization's determination to win proper provision for the veterans of the Second World War.

A veteran of the First World War, Jean Adam Brunner is French by birth. The son of Marie (Layer) and Jean Adam Brunner, he was born in Pont-à-Mousson in the department of Meurthe-et-Moselle, on October 31, 1893. When he was only a year old his family emigrated to the United States, where his father was to become the manager of the New York restaurant Holland House. Young Jean evidently became what is known as "a typical American boy" for, when his family returned to France for a visit twelve years later, people frequently referred to him as "that wild American." Jean's formal education was rather scanty; he was educated the "hard way," through experience. During his boyhood he sold newspapers on the streets of New York, and before the First World War he was employed as a clerk in the firm of Peter McDonnell, transportation agents.

When he was twenty-four years old Brunner made another trip to France, this time as a Yankee soldier in the Judge Advocate General's Department. In July of 1919, eight months after the Armistice had been signed, Sergeant Brunner returned to the States, at a time when the shouting that had earlier greeted returning veterans had subsided, and the soldier had become a man in need of a job and advice. Brunner soon joined the Veterans of Foreign Wars, becoming a charter member of the Joseph A. Wynn Post 260 in Brooklyn. By 1923 he was commander of that post, and two years later he headed the Brooklyn Council of the V.F.W.

In less than twenty years Brunner worked his way up from the Brooklyn Council to the position of commander in chief of the national organization. He was the head of the New York Department of the V.F.W. in the year 1927-28. Then from 1928 to 1936 he held no post in the V.F.W. In 1936 he took a post again, for two years serving as a member of the National Council of Administration of the V.F.W. Again for three years, until 1941 when he became national chief of staff, there was a gap in his executive activities. From 1942 until 1944, however, he was junior and then senior vice-commander in chief of the organization, and in August 1944, at the closing session of the forty-fifth encampment, Jean Brunner was elected national commander. He served until October 1945, when he was succeeded by Joseph M. Stack.

Strauss Peyton

JEAN ADAM BRUNNER

The Veterans of Foreign Wars of the United States, an organization of eight hundred thousand members, second only in size to the American Legion, was formed in 1913 by the merger of the American Veterans of Foreign Service (1899) and the Army of the Philippines. Together, the V.F.W. and the Legion in their fight to win benefits for veterans, wielded tremendous power during the period between the two world wars. Their insistence upon compensation rights and special bonuses in a time of great instability caused much bitterness among other groups struggling for economic security, and the two bodies were accused of an antilabor, antinational welfare attitude. "If such sums must be taken out of the Treasury," wrote the *Nation* when the first bonus bill was introduced, "then let them be appropriated as a whole to the general welfare in which the ex-soldiers share."

In the field of foreign affairs, the V.F.W. held, as did other groups, that only by an isolationist policy could the United States avoid another war. The year that the Japanese occupied cities on the coast of northern China (1937), the slogan of the V.F.W. was "Peace for America"; in 1939 the organization called for an eighteen-point neutrality program. Such policies in a world armed for aggression were gradually recognized as untenable, and by the next year the V.F.W. had committed itself to support of "an intensification of America's national defense program" by aid to Britain, and "adoption of forceful policies that will convince potential enemies America is prepared to meet the challenge of the dictators."

The attitude of the V.F.W. toward the world organization for peace, although it has not been isolationist, is felt by critics to display some of the former caution that characterized its policies in the twenties and thirties. In 1943 it registered "unalterable opposition" to the amalgamation of the United

BRUNNER, JEAN ADAM—*Continued*

States into a world organization or superstate; and in 1944, the year Brunner became commander, it adopted a resolution opposing "impractical and visionary charity" in distributing American relief to other nations after the war, since it considered that the primary obligation is to the people of the United States.

As part of its own postwar program, the V.F.W. has launched a training program to prepare discharged wounded soldiers as field workers in the fight for favorable veterans' legislation. It charged the Government's Veterans Administration in early 1945 with "red tape processes, undue delay and duplication of effort in handling beneficiaries." And, together with the American Legion, the V.F.W. earlier helped to enact the GI Bill of Rights.

With the war at an end, the problem now closest to the Veterans of Foreign Wars, as to the rest of the Nation, is the employment of returning veterans. Of the twelve million men again taking up civilian life, the majority will need work; many of these will find their former jobs no longer in existence, or filled by others. The question that arises is how to take care of these veterans without dislocating the national economy and ultimately creating even wider unemployment. Brunner himself, who has toured the fighting fronts and talked with or to thousands of soldiers, reports their concern over what the future holds for them. He has told them not to expect a "Santa Claus," but probable strikes; and he has suggested that they accept the first job opportunity offered, then later look for more attractive openings. The men overseas have already shown their ability and bravery, he says. "Now they must come home with the realization that America is again ready to judge them for their competence, their ability and desire to get to work and to a good job as workers and family men."

In an effort to make this possible, more than one solution has been advanced. Democratic Senators Robert F. Wagner '41 and James E. Murray '45 have drafted a bill, approved by President Truman '45, which aims at creating full employment by encouraging private industry to maintain full production. Only in the event that private industry is not capable of employing all the people who need jobs does the Murray-Wagner bill propose that the Government initiate a program of public works. The national legislative representative of Brunner's V.F.W., Omar Ketchum, has opposed this, declaring at a hearing on the bill that he had not been authorized to "endorse the principle that among constitutional rights shall be the guaranty of a gainful, suitable job for every American, even if the Government has to provide it."

The bill that the Veterans of Foreign Wars offers as an alternative to the Murray-Wagner full employment bill is one that the organization itself drafted, and which Republican Representative Knutson introduced into the House. This bill requires employers to credit veterans with job seniority equal to time spent in the armed forces. Another provision of the bill frees the veteran for one year from any obligation to join or pay dues to a union, irrespective of any law or contract. The view of organized labor on the question of seniority is in profound disagreement with this latter proposal of the V.F.W. Union recommendations are that seniority rights be applied only after the returning veteran has got a job. If a layoff should occur, the new employee who came as a veteran would then have not only his months or years of actual work in the plant to his credit, but, in addition, the equivalent of the number of months or years during which he was in uniform.

The first major veterans' meeting after the Allied victory was the forty-sixth annual encampment of the Veterans of Foreign Wars in Chicago from October 1 to 4, 1945, when servicemen from at least seventeen countries gathered, ranging in rank from air marshals to enlisted men. Brunner remarked that the primary goal of this international gathering was that the delegates return to their countries "deeply impressed with our sincere desire to make the purposes of the United Nations Charter effective." He placed the organization on record as favoring a continuation of the draft until all overseas soldiers were released from the service, and also declared that the GI Bill of Rights could never benefit more than four or five million veterans (out of an estimated twelve million). Discussion at the conference included the suggestion of a bonus for veterans of the Second World War (to be called "adjusted pay") of three dollars a day for service in the United States and four dollars a day for overseas service. Brunner also stated that veterans would insist on labor-management-Government teamwork, and he asked that the first choice of new housing go to veterans.

At the same time that Jean Brunner has been working for the veterans he has been building a business career for himself. After the First World War Brunner worked in the export department of the Texas Oil Company for four years, until 1923, when he left to take a position in the Cross and Brown Company, real estate firm, where he has been ever since. He began there as a clerk, but his position in the firm, when he left for a leave of absence in August of 1944, was that of secretary. The tall heavy-set veterans' leader, who is unmarried, lives with his sister in Forest Hills, Long Island. He neither drinks nor smokes, and his favorite recreation, he says, is fishing.

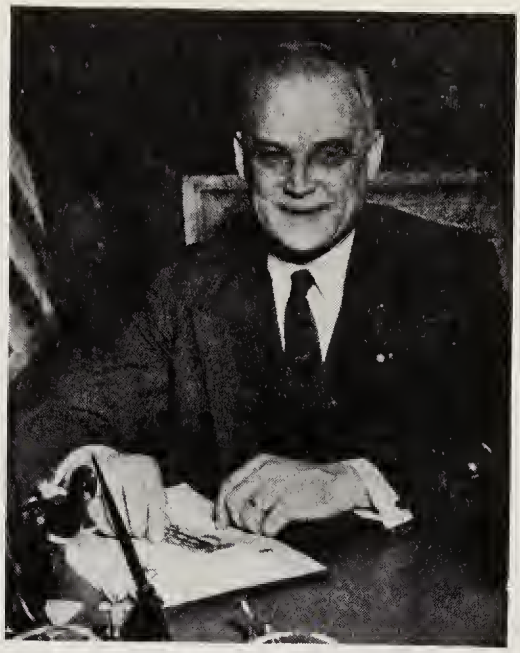
BURTON, HAROLD H(ITZ) June 22, 1888- United States Supreme Court Justice

Address: b. c/o United States Supreme Court, Washington, D. C.; h. Hotel Cleveland, Cleveland

The first Supreme Court Justice appointed by President Truman '45 (on October 1, 1945) is Harold H. Burton, lawyer, ex-Senator, and thrice Mayor of strongly Democratic Cleveland. Republican Senator to the United States Congress from 1940 until his resignation in September 1945, Burton served on the Military Affairs and War Investigating committees and collaborated on the defeated B2H2 bill calling for United States leadership in a United Nations organization to maintain peace; he was also a co-sponsor of a Federal industrial relations bill which would modify many of the laws passed in recent years for the protection of labor, including the Wagner Labor Relations Act and the Norris-La Guardia '40 Anti-Injunction Statute.

Harold Hitz Burton was born in Jamaica Plain, Massachusetts, on June 22, 1888. His father was Alfred Edgar Burton, then dean of Massachusetts Institute of Technology, and his mother was the former Gertrude Hitz. After graduating from Newton High School in Newton, Massachusetts, young Burton attended Bowdoin College, in Maine (B.A., 1909), where he was a quarterback on the football team and a Phi Beta Kappa student. Eager to become a lawyer, he studied at Harvard University Law School and was graduated in 1912. Believing that New England was not the ideal location for an aspiring lawyer not fortunate enough to have inherited an established law business, he moved to Cleveland, where his wife's uncle was living. (In June 1912 Burton had been married to Selma Florence Smith, whom he had known in high school. They now have four children, Barbara, William Smith, Deborah, and Robert Smith.) During the next five years the young attorney found the Middle West and West favorable territories for his law practice: in succession he was employed by the Gage, Wilbur and Wachner law firm in Cleveland (1912-14); as assistant attorney by the Utah Power and Light and the Utah Light and Traction companies in Salt Lake City (1914-16); and as an attorney by the Idaho Power and Boise Valley Traction companies in Boise, Idaho (1916-17).



HAROLD H. BURTON

With the outbreak of the First World War, the prospering attorney was commissioned a first lieutenant. He served (eventually as a captain) with the 361st Infantry, Ninety-first Division in the Army, receiving a citation and the Order of the Purple Heart, and the Croix de Guerre from Belgium, for his part in the Saint-Mihiel, Meuse-Argonne, and Ypres-Lys offensives. In 1919 his book *600 Days' Service,* a history of the 361st Infantry in the war, was published. In 1921-22 he served as a major with the Cleveland Grays.

From the close of the war until 1925 Burton was associated with the firm of Day, Day and Wilkin; and in 1925-29 with Cull, Burton and Laughlin. During 1923-25 he also served as an instructor in the law of private corporations at Western Reserve University Law School, Cleveland. In the late 'twenties a beginning interest in public affairs served as the springboard to his future political career. Having become concerned with plans for a regional government for Cleveland, Burton was made the unpaid research director of the citizens' committee which was promoting the idea. When the committee reached the point of drawing up a state constitutional amendment, it felt that Burton was the logical person to sponsor this measure in the State legislature. Consequently, largely through the efforts of the

BURTON, HAROLD H.—*Continued*

committee, Burton was elected to the Ohio House of Representatives in 1929.

That same year he accepted an appointment as director of law of the City of Cleveland, a post he held until 1932. In November 1931, when the city-manager system was supplanted by the mayor-council plan, Burton temporarily assumed the duties of Mayor until the mayoral election was held three months later. From 1933 to 1935 he then divided his time among his law firm, Andrews, Hadden and Burton, his chairmanship of the Cleveland Board of Education Committee on Citizenship Training, and the County Charter Commission of Cuyahoga County.

In 1935 Burton was nominated for Mayor of Cleveland, running as an Independent Republican. With the city overrun by gangsters, and 1935 a Democratic year, Burton's election on a reform ticket hinged on how strongly he could present his case to the voters. Although he did not have a gift for oratory, he campaigned sixteen hours a day in an attempt to contact as many diverse groups as possible, promising to make Cleveland "a happier place to live in, a better place to die in." These efforts were rewarded: he was elected (and re-elected twice) by the largest majority in the city's history. He chose Eliot Ness as his safety director, and together, with the help of the Cleveland *Press*, they "streamlined the city for swift, smooth law enforcement."

A major issue with which the Mayor was faced in his three terms in office was the problem of relief. Ever since 1935, when the Federal Government had turned relief measures over to the individual states to manage, Ohio had suffered a number of serious crises. By 1939 conditions were bad in Cleveland, as well as in other cities in the state. The rural-dominated State legislature, faced with the relief bill, had cut to fifteen million the eighty million dollars formerly allotted by the Federal Government. The estimated minimum need of the State was thirty million, and State laws made it almost impossible for the cities to levy taxes to raise the funds they needed. The cities of Ohio urged finally that a special meeting of the legislature be called to alleviate the situation, but Governor John W. Bricker '43 insisted that other means be found, saying that relief was essentially a problem for the big unemployment centers to handle locally and blaming the situation partly on WPA political manipulation.

In an address to the city's labor leaders, Mayor Burton said; "Labor can go to the Governor independently of the city. You can give him the devil far better than I can." In the end some state rulings were changed, the Federal Government contributed relief assistance, and Cleveland raised additional funds by the sale of bonds. When he relinquished his mayoralty in 1940, Burton was able to announce that the bonded debt of Cleveland had been slightly reduced. And, although a Republican, he claims credit for having obtained forty million dollars in WPA money in two years. During his period in office Cleveland reached a high level in civic morale—rackets were smashed, the racketeers imprisoned, and corrupt police officials ousted. The Mayor's emphasis on safety, public health, and free speech and tolerance gained for his city the National Safety Award in 1939 and 1940, the National Health Award, and the National Civil Liberties Award.

In 1940 Burton, although opposed by the State machine and boss Ed Schorr of Cincinnati, was elected United States Senator. In March 1943 the Senator came into the limelight when he, in collaboration with three other Senators—Joseph H. Ball '43, Republican of Minnesota; Carl A. Hatch '44, Democrat of New Mexico; and Lister Hill '43, Democrat of Alabama—sponsored the B2H2 bill, as Senate Resolution 114 has been called after the surname initials of the four men. The resolution called for United States leadership in forming a United Nations organization which should convene immediately to discuss the prosecution of the war, postwar problems, and, particularly, the establishment of an international police force to maintain the peace. Burton was one of eighteen Congressmen, nine Senators and nine Representatives, who barnstormed the United States in an attempt to impress upon the people the importance of the bill. Said Burton: "To my mind to fail to recommend some constructive postwar foreign policy that will translate into action at least the primary lessons of the tragedies of the First and Second World War is to default in the leadership placed in our hands." Senator Tom Connally '41, Democrat from Texas and chairman of the Foreign Relations Committee, was, according to *Newsweek*, "miffed at the four Senators' intrusion into his bailiwick," and the B2H2 bill was eventually buried in the Foreign Relations Committee. It was superseded by the Connally resolution which, although it recognized the importance of a general international organization to maintain peace and security, was considered by many as far too vague. Burton himself attacked the Connally resolution as "an easy way out for those who may wish to retreat from any advanced position in foreign affairs in the postwar settlement." During the Senate debate the Connally resolution was amended so as to include the substance of the Moscow agreement of 1943. This conformed closely to the B2H2 proposal, and as amended the Connally resolution was passed by a vote of 85 to 5. It established the Senate's approval of a general international organization to maintain peace and security. In February 1944 Burton's booklet, *America's Road to Lasting Peace,* was widely distributed to Republicans in public office.

Burton is an ardent proponent of a constitutional amendment to authorize the approval of treaties by majorities of both houses of Congress, instead of by two thirds of the Senate. Declares the former lawmaker: "This two-thirds requirement violates the principle of majority rule, which is a foundation principle of self-government." The forces advocating the amendment contend that the two-thirds Senate ratification makes it possible for a minority in the Senate to override a policy important to the welfare of the nation, and generally approved by the people themselves. Burton also urges that private enterprise and not the Government be instrumental in providing jobs for returning servicemen.

In regard to the more important bills presented on the Senate floor after Burton became a Senator, he voted against the repeal of the Neutrality Act; and for the Lend-Lease bill; for the legislation empowering the President in 1941 to extend the active military duty of enlisted men, selectees, national guardsmen, and reserve officers. In 1943 he supported the continuation of the reciprocal trade agreements program; voted for the Fulbright resolution and for the compromise servicemen's vote bill. In 1945 he voted for the George '43 bill which removed the Reconstruction Finance Corporation from the jurisdiction of the Secretary of Commerce, but opposed the confirmation of Henry A. Wallace '40 as Secretary of Commerce. He urged legislation to make the Fair Employment Practice Committee permanent; and proposed, with Lister Hill, a bill calling for a nationwide hospital construction program to be financed by Federal grants-in-aid to states. This was approved by the Senate in December 1945. In 1944 Burton made an extended investigation of slum conditions in the Capital, and advocated an opportunity for private agencies to provide better housing.

In the 1944 Presidential campaign, Burton announced support of Bricker when the latter's name was entered in Ohio's primaries. When Dewey '44 and Bricker became the Republican Party's candidates, the Ohio Senator stated that his vote would go to them. Said Burton: "We're going to have an anti-Roosevelt Senate, so we need an anti-Roosevelt President." Burton voiced the opinion that Roosevelt's continuance in office was not necessary to the winning of the war or the establishment of sound international relations. With the promotion of accord between Congress and the President as his primary concern, Burton declared: "Regardless of party, any man who remains President for twelve years is bound to accumulate frictions, disappointments, and prejudices that handicap him in dealing with the Legislature."

Senator Burton and Senator James M. Tunnell, Democrat of Delaware, both members of the War Investigating Subcommittee, were sent in January 1945 to the Mediterranean and Middle East areas to examine American investments, to investigate American agencies operating in the region, and to determine the state of petroleum resources. Burton reported on his return that he was "particularly impressed with the resources for wealth and prosperity in the oil fields of Iran, Iraq, and Saudi Arabia." Some other conditions in the region were said to be less heartening. Cost records of air bases improved or constructed there were inadequate, the Senators said, with the result that American rights in installations built or improved by American funds were seldom "clear cut." Burton and Tunnell also stated that unless the United States made commercial agreements—almost nonexistent now—with the countries of the Middle East, and unless she established credit agreements to permit citizens of these areas to purchase American goods with American money, the Middle East market would be closed to American trade after the war. The need for an economic policy toward the Mediterranean and Middle East was immediate, these two Senators emphasized.

Joining the campaign which began in June 1945 to insure ratification of the San Francisco Security Charter, Senator Burton indicated that its opponents might use a "perfectionist" attack upon the Charter instead of viewing it with a "revisionist" approach. In a three-hour speech in the Senate on June 13 he defended the veto arrangement insisted upon by the Soviet Union whereby one of the Big Five powers could veto the use of collective force to prevent aggression; he declared that this was a necessary limitation and as much in the interest of the United States as of Russia. He added that the Charter "comes well within the policy outlined" by the Senate at the time of the passage of the Connally peace resolution. In view of Burton's support of international cooperation, it had been expected in many quarters that he would support to the utmost attempts to hasten approval of economic cooperation; in July, however, he voted for Senator Taft's '40 unsuccessful motion to postpone to November 15 action on the Bretton Woods agreements.

In June 1945 Burton, together with his fellow Senators Hatch and Ball, introduced a Federal industrial relations bill (S.1171), which the authors claimed was designed to remove management-labor strife in the postwar period. Drafted by a committee of citizens headed by former labor lawyer Donald R. Richberg, who avowedly had not consulted any representatives of either labor or management in its formulation, the bill immediately drew the united opposition of organized labor. The bill proposed to reorganize the Federal agencies by 1) setting up an independent five-man Federal labor relations board to take the place of the present NLRB, the Conciliation Service of the Labor Department, and ultimately the WLB; and by 2) the creation of a special board of three members to control, under machinery now used by the NLRB, unfair labor practices either by employers or employees. This feature of the program, it was said, assumed that labor had reached the point where it might be considered on terms of equality with industry before the law, although labor legislation had for years been based on the presumption that labor was the weaker party in industrial disputes and required the protection of the Government to preserve its rights in collective bargaining. Other major provisions of the Burton-Hatch-Ball bill would require compulsory arbitration in many cases, put curbs on the union shop, place restrictions on the right to strike, and impose other restraints. In the flood of criticism that ensued, Philip Murray '41 of the CIO denounced the measure as a "bald-faced attempt to destroy labor unions and nullify the basic constitutional rights of workers"; the A. F. of L.'s William Green '42 labeled it a "strait jacket" which would lead to the regimentation of labor and industry and would undermine free collective bargaining.

Senator Ball, in an article in the New York *World-Telegram* on July 9, 1945, indicated the four major reasons which had impelled the authors to propose the bill: 1) "there is grave danger of widespread stoppages of production as a result of labor disputes"; 2) "Federal labor policy on labor disputes today is confused, with jurisdiction scattered among many agencies"; 3) "many closed unions . . . monopolize for a privileged few the employment opportunities"; 4) "it is high time, if we want industry to expand, to afford employers some protection against arbitrary and coercive actions by employees." In another defense of the bill,

BURTON, HAROLD H.—*Continued*

Burton declared, "It will strengthen America's system of private enterprise in the interest of employer, employee, and the public."

The Republican Senator was elevated to the Supreme Court bench in October 1945, as successor to Justice Owen J. Roberts '41, who retired in July. The Senate, waiving its customary procedure of holding open hearings on judicial appointments, on September 19 unanimously confirmed Burton's nomination as an Associate Justice. Commentators for the most part agreed that President Truman had "revealed an innate fairness" in naming a Republican to the Court with only one member of that party left on the bench, Chief Justice Stone '41. The choice received praise from Senators of both parties, although there has been considerable speculation as to where Burton's economic and other views would place him in the tribunal. "Those who know him best," wrote Lewis Wood in the New York *Times* before the confirmation, "describe him as a liberal Republican of marked independence, who could never be accused of reactionary tendencies, but whose appointment would certainly not enlarge the 'advanced' wing of the Court as typified by Justices Hugo L. Black '41, William O. Douglas '41, Frank Murphy '40, and Wiley Rutledge '43." Burton himself commented: "My position is center. I hold to the belief that if folks get around a table and talk things through they usually can come to the right and fair answer." President Truman was present at the Supreme Court installation ceremony on October 1, thus becoming the first Chief Executive to appear in the courtroom while in office.

In May 1944 Burton was elected moderator of the Unitarian Churches of the United States and Canada for a two-year term. He is a member of the National Board of Incorporators of the American Red Cross, and is a member of the American Legion and the Veterans of Foreign Wars. The Justice also belongs to the American, Ohio, and Cleveland bar associations, and to a number of clubs.

Mild-mannered but energetic, Burton, since the beginning of his political career, has not missed a day of work because of illness. The Justice's lack of hobbies can be plausibly attributed to his busy life. However, his and Mrs. Burton's love of the out-of-doors brings them frequently to the parks in and near Washington. Their two daughters are married. Both sons and a son-in-law in 1945 served in the armed forces.

CALLOWAY, CAB (căl'lō-wā) Dec. 25, 1907- Conductor; singer

Address: b. Cab Calloway, Inc., 1619 Broadway, New York City; h. Riverdale, N.Y.

Cab Calloway, the Negro orchestra leader, has been billed as "King of Hi De Ho" since the early thirties. He is famous for his individual style of singing, his voice having been described as containing "a joy and festive spirit which moves one to instant gaiety." Considered the "personality boy" among his colleagues, Calloway has been presented to the American public through almost every medium of entertainment—night clubs, the stage, the screen, and radio.

Cab (short for Cabell 3d) was born on Christmas night of 1907, in Rochester, New York. He was the second of the six children of Cabell and Eulalia (Reed) Calloway. When Cab was six years old the family moved to Baltimore, Maryland, where his father practiced law and conducted a real estate business. After school hours young Cab sold newspapers, and on Sundays he sang solos in the Bethlehem Methodist Episcopal Church, until he was graduated from Douglass High School at the age of seventeen. Although his father's fondest wish was to have Cab, the eldest son, study law, the boy had made up his mind to become an entertainer, and he turned to his older sister, Blanche, for advice and assistance when he finished school. She was his idol because she had gone to Chicago and was singing with a show.

Sister Blanche not only sent her brother the railroad fare for his trip to Chicago, but she got him a place as a singer with a quartet. Between performances he learned the fundamentals of acting under Blanche's tutelage and attended Crane College, purportedly in preparation for a law career. After a short period of drifting about from one South Side night club to another as a singer and master of ceremonies, Calloway found that he had a real talent for the drum. He had been spending most of his free time with musicians, and it was one night, while giving vocal assistance in an impromptu "jam session," that he tried his hand with the drumsticks and amazed himself as well as his friends by the results he obtained. A year of lessons on the drum followed, and in 1925 he secured the job that he looks back on as the beginning his career—that of drummer in the orchestra at the Sunset Cafe in Chicago.

When his musical apprenticeship was over Calloway organized his own orchestra and became both its leader and vocalist. "Cab Calloway and his Alabamians," as they called themselves, became very popular in Chicago, and within six months were on their way to New York to fill an engagement at the Savoy Ballroom in Harlem. At the Savoy the band was a dismal failure and the engagement was canceled. Calloway, becoming discouraged, dissolved the orchestra, and got himself a part in the all-Negro cast of a new Broadway musical comedy, *Connie's Hot Chocolates*. In it his rendition of the song "Ain't Misbehavin'" was a high spot and assured his success. Irving Mills, a Broadway manager, seeing Calloway's possibilities as an orchestra leader, became his personal manager and placed his discarded baton back in his hand. That same year, 1929, the Calloway orchestra joined Duke Ellington's '41 at the Cotton Club in New York, and for the next ten years the two musicians, who are good friends, played alternate engagements there. While the Ellington orchestra appeared at the Cotton Club, the Calloway band toured. It played in London and Paris as well as in numerous cities in the United States. It was during this long stay at the Cotton Club that Calloway developed the distinctive style of singing for which he is known today. One night, while introducing a new song, he forgot part of the lyrics. Forced to improvise quickly, he filled in the gaps with "skeeten, scaten, hi de ho." The enthusiastic reaction of the audience caused him to try it again, and before long the Calloway nonsense syllables had become a new style of jazz singing.

Cab Calloway, Inc.

CAB CALLOWAY

Early in his career the song "St. James Infirmary Blues" had become closely associated with the name of Cab Calloway. Shortly after he opened at the Cotton Club Calloway and his manager decided to find another song just as well suited to the singer's talents. After an unsuccessful search for a song the two sat down early one morning, when the club was empty of guests, and composed "Minnie the Moocher." The night he introduced the song Calloway was called back for six encores. His recording of Minnie's activities became internationally famous and a collector's item. The records have been sold in Bangkok, Sydney, and Shanghai, and in all the principal European cities. Whenever Calloway performs he includes these two songs in his program.

When the Cotton Club closed the Cab Calloway orchestra went on a tour of the United States. It appeared in such well known amusement places as the Casa Manana in California, the Panther Room of the Hotel Sherman in Chicago, and the Lookout House in Cincinnati. In theaters all over the country the Calloway troupe played to standing-room-only audiences, returning to New York just long enough to perform at the Strand and Paramount theaters. During a two-week engagement at the Paramount audiences paid $84,200 to hear him, a new summer record. In 1943 Calloway and the orchestra accepted an offer from the Park Central's Cocoanut Grove in New York, where they remained for an extended engagement. From there they went to Frank Dailey's Meadowbrook in New Jersey and finally back to Broadway for a prolonged stay at the Cafe Zanzibar, where Calloway heads the Negro group of entertainers.

In 1938 Calloway published the first edition of his *Hepster's Dictionary*, two million copies

CALLOWAY, CAB—*Continued*

of which were distributed. The pamphlet, which is the official "jive language" reference book in New York Public Library, is a collection of slang words and expressions used by entertainers and musicians—particularly in Harlem. In the foreword to the 1944 edition, which is the sixth, Calloway denies that any of the words are not actually used: he says they are authentic expressions which he discovered through careful research, or were contributed by people from all over the country. He has coined many of the phrases himself, being credited as the originator of the term "jitterbug." In Calloway's vocabulary "fortissimo" has become "sock it," and "scherzo" has been replaced by "medium bounce." Academic recognition has been given Calloway by New York University, which has awarded him the honorary title of Dean of American Jive.

Calloway has sung to fame many of his original musical compositions. His songs include "Chinese Rhythm," published in 1935, and "Jumpin' Jive," which appeared four years later. "Are You Hep to the Jive?" came out in 1940, and "Are You All Reet" in 1941. Three songs, "Virginia, Georgia and Caroline", "Geechee Joe," and "Mein Nein," appeared in 1942. Another novelty tune, the title of which is in deep "jive language", "Foo a Little Bally Hoo," was introduced the next year, with "If This Isn't Love" coming in 1945. In 1945 he is working on an operetta, tentatively titled *Rhapsody in Reverse*, which is based on the compositions of the old masters as they would be played in swing.

Calloway's unique brand of entertainment has been successfully adapted to the radio and screen. He has appeared in several song cartoons, including *Minnie the Moocher* and *Old Man of the Mountain*, and in the short subjects *Hi De Ho, Cab's Jitterbug Party,* and *Manhattan Merry-Go-Round.* Among the full-length motion pictures in which he has been featured are Paramount's *Big Broadcast* (1932), *International House* (1933), and *Roadshow* (1941), in which he was described as "a leader in the field of musical riot." In 1943 he was awarded an "Oscar" by the Negro Actors Guild for his performance in the Twentieth Century-Fox film *Stormy Weather*, in which Lena Horne '44 headed the all-Negro cast. In 1944 he returned to Hollywood to play a leading role in Andrew Stone's *Sensations of 1944.* Besides broadcasting regularly from the night club or hotel in which he happens to be playing, Cab has had his own program, *The Cab Calloway Quizzicale,* a satirical version of the question-and-answer radio shows. He has been a frequent guest on the *Fitch Bandwagon* and the *Coca-Cola Spotlight Bands* programs, and has made several test performances before televison cameras. In his survey of jazz for *Esquire's 1945 Jazz Book*, Leonard Feather states that some critics acknowledge Calloway's important place as a hot jazz singer, while most "consider him more of a showman and entertainer . . . the leader of a consistently fine orchestra, combining swing, precision, and finesse in its ensemble work with a high standard of inspiration."

During the war the Calloway orchestra was among the leading units which entertained for servicemen. Calloway and the band were the first group of musicians from the United States to tour the Canadian Maritime Provinces, as well as the first to entertain the United States troops stationed in Nova Scotia. The orchestra played at the reopening of the Stage Door Canteen in New York, and Calloway's *Quizzicale* was the first radio show to be broadcast directly from an Army camp.

Calloway has said that he is so sensitive to the moods of his audiences that he can tell exactly what they want to hear. "If I feel that they seem to want faster tempos, I always step up my orchestra and revamp the schedule of the tunes to come. It is always the duty of a bandleader to be ready to give his audiences what *they* want, not what he wishes to dish out." He auditions hundreds of young musicians who write and call him for hearngs, and, while he is unable to hire every talented hopeful he meets, he has helped numerous beginners to get jobs with bands.

Calloway and Wenonah Conacher were married in 1928 and have one daughter, Constance Wenonah. The musician weighs one hundred and eighty pounds and on the stage appears much taller than his five feet eight and a half inches. He achieves this effect by having his jackets and coat tails cut extra-long. Well known for his eccentricities of dress, Calloway is said to be the owner of forty suits and forty pairs of shoes. When working he makes as many as twelve changes in suits an evening, and he still frequently appears in the famous white zoot suit which he wore in the film *Stormy Weather.*

CANHAM, ERWIN D(AIN) (kăn'ăm) Feb. 13, 1904- Newspaper editor

Address: b. c/o The Christian Science Publishing Society, 1 Norway St., Boston, Mass.; h. 72 Crofton Rd., Waban, Mass.

Widely regarded as one of America's outstanding journalists, Erwin D. Canham became editor of the *Christian Science Monitor* in 1945 after four years' experience as managing editor of the paper and many previous years of *Monitor* service as a national and foreign correspondent. A native of Maine and a former Rhodes Scholar with degrees from Bates College in Maine and Oxford University in England, Canham reported from Geneva in the years when it was the political center of the world and headed the *Monitor*'s Washington news bureau during most of the nineteen-thirties. He has traveled extensively in Europe and the Orient, and has made many transcontinental tours of the United States with Presidential candidates. His column, *Down the Middle of the Road,* has appeared once each week since 1940 in the "dignified, intellectual, progressive" paper which is the only one of the eight Boston-published newspapers that has an international circulation. The *Christian Science Monitor* "shines like a bright star" among Boston newspapers, and is, in the words of Oswald Garrison Villard '40 in *The Disappearing Daily* (1944), "the sole remaining daily to recall the Hub's lost reputation for high intelligence and literary and intellectual taste."

The son of Vincent Walter and Elizabeth May (Gowell) Canham, Erwin Dain Canham was born into a Christian Scientist home in Auburn, Maine, on February 13, 1904, and he spent his youth in the general area of Auburn, which is thirty miles north of Portland. In this rural section many influences were to shape his future career. His father was agricultural editor of the *Lewiston Sun and Journal*, and the boy, in almost daily visits to the office of the country daily, early became familiar with printer's ink. In grammar school days he set type and folded and sold papers after school, and at the age of fourteen, while a student at high school, he worked during the summer on a local daily paper. The United States was fighting in the First World War at this time, and "because of the manpower shortage," he points out, he was a full-fledged reporter. Later, when the older men returned, he "reverted" to the composing room of the paper, working as galley boy and doing odd jobs. From that time he was occupied summer after summer with newspaper work of one kind or another, and there was never any question in his mind as to the choice of his vocation.

In 1921 young Canham entered Bates College in Lewiston. At the end of his junior year he was writing for a small paper, the *Hill-Top*, which was published in Poland Springs; "I sometimes managed to get in about twenty pages," he recalls with a smile. At this time he was also correspondent for eight metropolitan dailies and making more money than he did later as a full-time reporter. Debating was his chief extracurricular activity while in college. During his sophomore year he took part in the first debate with Oxford University to be held in America, and in the spring of his senior year he went to England with the college debating team, which competed with seven British universities. After receiving his B.A. degree from Bates in 1925 he worked as a reporter for the *Monitor* for a year and then went to Oxford as a Rhodes Scholar, studying there from 1926 to 1929 for the B.A. and M.A. he finally received in 1936. During all these years abroad Canham continued to report for the *Monitor*. His first important assignment was to cover American activities at the League of Nations Assembly in Geneva in the years 1926, 1927, and 1928. In 1929 he returned to America and reported Ramsay MacDonald's tour of the United States.

In 1930 Erwin Canham was married to Thelma Whitman Hart of Truro, Massachusetts. That year the young newsman was chief correspondent for the *Christian Science Monitor* at the London Naval Conference for three months, and then for two years he again reported the activities of the League of Nations from Geneva. In 1932 he was made head of the Washington bureau of the *Monitor*, a position which he held until 1939. During this period he frequently left Washington for *Monitor* news assignments: he attended the London Economic Conference with the American delegation in 1933 and was one of a group of twenty newspapermen to cover the inauguration of the Philippine Commonwealth Government in 1935. He wrote numerous articles on the Far East for the *Monitor* at this time. He also made several nationwide political surveys during these years and covered trips of American Presidents and Presidential candidates throughout the United States. By 1939 he was promoted from reporting to the general news editorship of his newspaper at the Boston publishing office, and in 1941 he was made managing editor. Since January 1945 Canham has been editor of the *Monitor*.

Bachrach

ERWIN D. CANHAM

The *Christian Science Monitor* was launched in 1908 by Mrs. Mary Baker Eddy, the founder of the Christian Science Church. Feeling that the newspapers of the period were too sensational and that their emphasis on crime, disaster, and death was detrimental, she ordered her Board of Trustees to establish a daily newspaper whose principle would be "to injure no man but to bless all mankind." The first issue of the *Monitor* appeared on November 25, 1908. Mrs. Eddy directed the paper generally in its early beginnings until her death in 1910, and the news policy which she formulated has since governed the paper. This policy was set forth in an editorial in the first anniversary edition of the *Monitor* and has been republished many times since then; it is, in part: "It is not to be understood that the *Monitor* has stooped to a censorship so narrow or opinionated as to render its news service inadequate, inefficient, or incomplete. Far from it. Whatever is of public importance or affects the public welfare, even though it be news of what is ordinarily reckoned as crime or disaster, is printed in the *Monitor* in completeness sufficient for information but without unnecessary embellishment or sensational display. The emphasis, however, is reserved for the helpful, the constructive, the encouraging, not for their opposites."

The editors interpret this policy by mentioning disasters only when they are too big to be ignored or when they point a moral, and by printing stories of crime only when they are of social significance. Death and illness are mentioned as little as possible, and the verb "to pass on" is often used instead of "to die." The *Monitor* is owned by the Christian Science

CANHAM, ERWIN D.—*Continued*

Church, and the profit motive is secondary to the idealistic one. It does not accept advertisements for tea, coffee, liquor, tobacco, or any other products which it considers unwholesome. Ninety per cent of *Monitor* subscribers are Christian Scientists. Although its Boston circulation is small (15,000), and its entire circulation only approximately 155,000, its readers are said to live in ninety-six different countries and the paper reaches more than half a million people. "One of the most influential newspapers in the world, certainly one of the ten best in the United States," the *Monitor* is not popular, says *Time* Magazine, because it accents information, shuns sheer entertainment. And Kenneth Stewart '43, discussing in *PM* the weaknesses of the Boston press, says that the "limitations" imposed by the religious body prevent the *Monitor* from being "a complete newspaper, and from winning the complete confidence of many in Boston."

Because of the *Monitor*'s many unique aspects, Canham's work both as managing editor and editor has been difficult but challenging. As *PM* points out, he faces problems which most editors do not face. The *Monitor* must make its pages seem timely to the great mass of its readers outside Boston who receive the paper anywhere from one to thirty days late, at the same time that it keeps up with the hour-by-hour coverage of its local competition. Villard mentions another difficulty—the conflict between magazine and newspaper ideals which ensues because the *Monitor* is more of a daily magazine than a newspaper. *Time* feels that Canham's most important and difficult work on becoming editor lay in seeing that the paper passed theological as well as journalistic tests.

Local problems as well as those connected with war have tested Erwin Canham's ability as editor. In 1943 *PM* published an exposé of anti-Semitism in Boston and denounced the Boston papers for suppressing the news of these uprisings. When the *Monitor* was taken to task on this matter, Editor Canham met the issue, saying that the *Monitor* had been investigating anti-Jewish violence in Boston for many months but did not print a story about it because many responsible leaders in the Jewish community were disturbed at the prospect of publicity, feeling that it would do more harm than good. Later *PM* mentioned the *Monitor*'s fairness in dealing with racial minority group matters. In 1945 *PM* also commented on the fact that in Boston, which is seventy-five per cent Catholic, the *Monitor* is the only paper that comments unfavorably on any activities of the Catholic Church. In an article on the *Monitor* in the *Saturday Evening Post* (September 15, 1945) Marquis Childs '43 wrote: "*Monitor* correspondents are held accountable for a balanced insight into the situation they are assigned to cover"; and in holding to that policy the newspaper will sometimes delay the printing of an article on controversial issues until the discussion may be rounded out by material from other sources.

The *Monitor* has an editorial council of nine people. Canham is in executive editorial charge of the paper but responsible on matters of business policy to the *Monitor* business manager and the board of trustees of the Christian Science Publishing Society, and on editorial policies to the board of directors of the Mother Church. "High policy" decisions are made by this board of five. Although most of the editor's time is occupied in the editing of the paper and the supervision of its foreign correspondence, he does a considerable amount of writing for the paper he edits. In April 1945 the *Monitor* published an article by him, "The Continuity of American Government," and in May he reported from San Francisco on the United Nations conference. Some of the San Francisco columns were serious in nature and were signed by the editor; others were written in "human interest" style and in these he humorously called himself "our man."

Since 1940 his *Down the Middle of the Road* column has appeared four or five times a month. Usually editorial in style, this column deals in a forthright and pleasantly readable manner with domestic and international subjects, economics, current phases of the Second World War, and certain aspects of politics. The *Monitor* is generally independent in its politics, and the editor does not commit himself to any party in his column. Canham frequently uses the column to explain *Monitor* policies and to discuss freedom of the press and postwar journalistic plans. Some of the columns are extracts from speeches made to Rotary Clubs, the American Society of Newspaper Editors, and other groups. *Down the Middle of the Road* is popular with *Monitor* readers, many of whom write to the editor on some of the controversial matters discussed in the column. Speaking before the Rotary Club after the dropping of the atomic bomb on Japan in the summer of 1945, Canham emphasized that "power alone can never be the guaranty of peace." The fundamental need, he continued, "is to straighten out our thinking . . . to determine . . . to alleviate any friction spots which may develop in relations with other nations and—fundamentally—to learn to understand why other peoples have come to think differently on some questions. . . .In carrying out this determination, the press and radio have a very great responsibility and an equally great opportunity."

A great deal of press and literary comment on the *Monitor* has been made during Canham's editorial years, possibly because the Boston *Evening Transcript* ceased publication soon after he assumed his editorial duties, and attention focused on the *Monitor* and other Boston papers after the demise of the venerable *Transcript*, even though the *Monitor* is essentially an international, not a local paper. Most of this comment is favorable. The *Monitor* is called "an aristocrat in its field," a paper "published by intelligent people for intelligent people," and it is admired because it does not proselytize. (It confines its religious message to one daily article on the *Home Forum* page.) It is frequently noted that it is read by many people who are not Christian Scientists. *Time* speaks of its "clean, unruffled prose," and its fine typography, and *PM* likes its timeless, leisurely style. *PM* also feels that it is consistently international in viewpoint, and Oswald Garrison Villard thinks the *Monitor's* conception of journalism is "the hope of the world." However, Villard criticizes the *Monitor* because it is too "soft-spoken" and does not crusade or strike out vigorously enough against wickedness and injustice. Villard also maintained that the *Monitor* supported the war, which he feels is inconsistent with its devotion to the teachings of Christ; he does point out, however, that the newspaper presented the Christian Scientist viewpoint about the war—that the victory of the democracies would mean a continuance of the slow but steady progress toward a world without war.

In 1942 the *Christian Science Monitor* received the fourth annual Maria Moors Cabot award for distinguished service in the field of inter-American relations. In 1943 the University of Missouri award for distinguished service in journalism was given to the international daily, and in 1945 it was chosen from among one thousand leading American papers for the thirteenth annual Francis Wayland Ayer award for typographical excellence. Also in 1945, the *Monitor* received the Helms Athletic Foundation award in recognition of noteworthy achievements in the realm of sports. Erwin Canham stopped in Los Angeles on his way to Boston from the United Nations conference at San Francisco to receive this award for his paper, saying at that time that it is the purpose of the *Monitor's* sport pages to tell the world that it is possible to compete keenly without bitterness or hatred.

The *Monitor* and other periodicals and books of the Christian Science Church are published in a "block-big, sedate Boston palace" which cost four million dollars and is a constant source of amazement to visiting journalists, who comment on its landscaped gardens, its "hushed and palatial precincts," and its "unbegrimed" pressmen and linotypists who do not smoke, drink, or swear in the newspaper's unhurried and serene atmosphere.

The *Monitor* editor is well liked by his colleagues who call him "Spike" and describe him as "clean-cut," affable, competent, and conscientious. Oswald Villard considers Canham an able and experienced newspaperman who believes that the *Monitor* owes its strength not to any individual but to the ideals behind it. Canham is aware of public criticism of his paper but he is ever conscious of the mandate which rules its policies. He realizes, too, that there is great power in being freed of commercial control and for that reason is more eager to maintain its idealistic standards and at the same time to prevent the paper from becoming a house organ. He feels that the essential function of a newspaper is to give facts, and not "to sell the informational birthright for a mess of entertainment pottage."

Erwin Canham is a Mason, a member of Phi Beta Kappa and Delta Sigma Rho, the Gridiron Club (in whose shows he has acted), the Association of American Rhodes Scholars, and of the American Society of Newspaper Editors. He was president for two terms of the Overseas Writers' Club and is a trustee of Bates College. As American correspondent, he contributes an article every three months to the *Round Table,* a British quarterly. He frequently speaks on the radio, and in May and June of 1945 broadcast over Mutual Network, substituting for Cedric Foster who was in the Pacific area. In December the editor began a weekly commentary over the ABC network. The program, under the sponsorship of the *Monitor,* also presented a dramatized documentation of special events headlined by the paper.

In appearance Canham is of medium height, broad-shouldered, with dark hair and eyes. He is described as a friendly man, relaxed in manner, and although of a serious, scholarly mien, he has a sense of humor that "lies just beneath the surface." His office resembles a spacious living room, and frequent callers are received there.

The *Monitor* editor and Mrs. Canham and their two daughters, Carolyn and Elizabeth, live in Waban, a suburb of Boston. The editor says that he has no hobbies, but while at home he spends much of the time out-of-doors, gardening and cutting wood on the acre of woodland behind his home. He does a great deal of his writing at home.

CANTERBURY, GEOFFREY FRANCIS FISHER, ARCHBISHOP OF *See* Fisher, G. F.

CARAWAY, HATTIE W(YATT) Feb. 1, 1878- Government official; former United States Senator from Arkansas

Address: h. Jonesboro, Ark.; 100 Maryland Ave., N.E., Washington, D. C.

The only woman ever to be elected to the United States Senate in her own right is Hattie W. Caraway of Arkansas, who in December 1944 completed thirteen years of service in that chamber. A Democrat and a Methodist, she was born on a farm in the Deep South, near Bakerville, Tennessee. Her birthday was February 1, 1878. The daughter of William Carroll and Lucy Mildred (Burch) Wyatt, she was given the simple name of Hattie. At fourteen she entered the Dickson (Tennessee) Normal College, graduating with her B.A. in 1896. (Many Southern "colleges" of the day were what one would now term high schools.) The future Senator led a very rural sort of life; indeed, she has told reporters that she had never even seen a railroad train until her marriage. It was in 1902, when she was twenty-four, that dark-eyed Hattie Wyatt was married to Thaddeus H. Caraway, a thirty-

HATTIE W. CARAWAY

one-year-old lawyer, and went to live in Lake City, Arkansas.

From that time on, Mrs. Caraway was a housewife of the classic model, even keeping a kitchen garden and helping her husband run the cotton plantation he later acquired. She took little part in political or social activities, devoting her time to her homemaking and to the rearing of her children, Paul Wyatt and Forrest. (A third son, Robert Easley, is deceased. Brigadier General Paul Caraway, "an outstanding planner," *Time* was to report in 1945, served in the Second World War as deputy chief of staff to the Chinese Combat Command under Major General Robert Battery McClure.) "After equal suffrage in 1920," Senator Caraway now reminisces, "I just added voting to cooking and sewing and other household duties. Of course living in Arkansas helped a lot, for down there we don't have to bother about making a choice between two parties." Six years after their marriage Thaddeus Caraway was elected prosecuting attorney of the Second Arkansas Judicial Circuit—on the Democratic ticket, of course. After two terms as prosecutor he was elected in 1912 to the Federal House of Representatives in the Sixty-third United States Congress, and was re-elected at two-year intervals to the Sixty-fourth, Sixty-fifth, and Sixty-sixth Congresses. Mrs. Caraway continued for "a good many years" to do all her own housework in Washington, as at home in Jonesboro, and entered into little social activity.

In 1920 (the first election, incidentally, in which women might vote) Representative Caraway entered and won the race for a seat in the upper house. He was re-elected to the Senate in 1926 for another six-year term, serving in the administrations of Harding and Coolidge. During his ten years in the Senate, Caraway had a reputation for a sharp tongue (he made perhaps half a dozen public apologies in the course of a year), for keenness in Senate investigations, and for his hatred of lobbyists (he became chairman of the Lobbying Committee). His particular interests were flood control and air safety legislation. The Caraways' sons, meanwhile, were both appointed to West Point, graduated, and started on their careers as Army officers.

In September 1931, during the Hoover ['43] Administration, Senator Caraway fell ill, and on November 6 he died. As a chivalrous gesture, and to give the politicos time to agree on a successor, Governor Harvey Parnell appointed Caraway's quiet widow to fill out the unexpired term, and she was duly elected in January 1932. (Her first official utterance on entering the Senate was, "The windows need washing.") Competition was keen for the nomination to replace Mrs. Caraway at the regular election; but, to everyone's surprise, she was persuaded by her fellow Senator Huey Long, the "Kingfish" of Louisiana, to campaign for re-election when her term expired in March 1933.

"To tell the honest truth," says Mrs. Caraway of Long's suggestion, "I was a good deal embarrassed, for, while the proposition had assets it was not without its liabilities." But she accepted his help and his advice—to doff her bright clothes for widow's weeds and to wear just one hat throughout the campaign. Then "down into Arkansas Long boomed with his sound trucks and Bible, and in the course of nine red-hot days he made exactly thirty-nine speeches in thirty counties," persuading the people of Arkansas (or as many as were white and had paid their poll tax) to send Mrs. Caraway back to the Senate. And they did, choosing her in preference to the wartime Governor of Arkansas, as well as a Democratic National Committeeman, a former commander of the American Legion, and three other opponents.

Assuming her seat in 1933, "Miss Hattie" was the first woman to be elected a United States Senator (Rebecca Latimer Felton of Georgia had been appointed in 1922 to fill out an unexpired term). A thoroughgoing supporter of President Roosevelt ['42] since his inauguration, she devoted herself to voting as she thought her late husband would have done, and to furthering his ideas. Seldom did she make a speech (about once a year) or enter debate. "I haven't the heart to take a minute away from the men," she confided. "The poor dears love it so." But she worked hard at being a Senator: "Every morning I got down to the office at eight, an hour before the office force. I read every bill, every line in the *Congressional Record,* and every book I thought helpful. As for committee meetings, I don't think I've ever missed one, and that's where the important work of the Senate is really done. Thank heaven, I was fortunate enough to get on Agriculture and Commerce and also Forestry, for they were matters I knew something about and had a keen interest in. Just by looking at me you ought to be able to tell that I'm a farm woman, and as for flood control, Arkansas has more miles of streams than any other state in the Union."

Senator Caraway was placed also on the Library and Enrolled Bills committees, establishing a precedent by eventually becoming chairman of the latter, with Harry S. Truman ['42] as the one other majority member. This is an undramatic but necessary committee which sees to it that every Senate-originated bill which has been passed is sent to the Government Printing Office in correct form, the proof checked for absolute accuracy, and an "enrolled" (official) parchment copy struck off, signed, and certified by the secretary of the Senate, the Vice-President, and the Speaker of the House of Representatives. After the President's signature is affixed, the enrolled bill is sent to the State Department, where it is kept for a year; then it is turned over to the National Archives.

During official sessions, Senator Caraway sat listening for hours, often bending over a crossword puzzle, while the men argued. "It's funny," she remarked at the close of debate on the Federal Land Bank Bill, "how they talk on after we've all made up our minds." "Conspicuously inconspicuous," without cosmetics and dressed in plain black, the Senator came to work by streetcar, often bringing her lunch; outside her office door there was often a row of milk bottles. Mrs. Caraway introduced a number of bills—forty-three on one memorable day, voted the regular Democratic line in an almost inaudible voice, and presided over the Senate for the first time in May 1932, in the absence of Vice-President Garner and the usual Senate president, pro tem. She was also the Senate's first woman committee chairman, first woman senior Senator, first woman to conduct a Senate committee hearing.

The Arkansan remained a stanch prohibitionist, anti-lobbyist, and defender of women's rights. (To the confusion of some, another Mrs. Caraway was president of the Women's National Republican Club during "Miss Hattie's" first full term.) Her one important defiance of the Administration, in January 1938, was in attacking the anti-lynching bill. Later that year Mrs. Caraway went back to Arkansas, without the help of her late friend Huey Long (whose widow Rose filled out his term from January 1936 to January 1937), and was reelected for six more years, again the only woman Senator.

In her second elective term Mrs. Caraway continued to support the President in general, but joined other Southern Senators in November of 1942 to prevent closure of debate on the anti-poll tax bill. She voted with the farm bloc on several occasions: for overriding the veto of the inflationary Bankhead '43 farm price bill; for forbidding the Administration to use subsidies for food price rollbacks, while permitting them to encourage production of certain crops; for the Bankhead amendment to force a "readjustment" of the ceiling prices on cotton textiles. She voted also to repeal the Executive order limiting salaries to twenty-five thousand dollars after taxes; for a tax which fell more heavily on smaller incomes; for the Smith '41-Connally '41 anti-strike bill, to override the veto; and for the Connally-Harness compromise anti-strike bill. Other Caraway votes in opposition to the Administration were for the McKellar bill to require confirmation of Federal appointments to most positions paying more than forty-five hundred dollars yearly, and for overriding the veto; she voted also to substitute the Rankin '44 "States-rights" voting qualifications bill for the Federal ballot bill.

In January 1943 Senator Caraway became cosponsor of the Lucretia Mott Equal Rights Amendment to the Constitution, the first woman Congressman to endorse the measure, which had been presented to the Senate eleven times. (Margaret Chase Smith '45 of Maine and Winifred C. Stanley '43 of New York were the first women Representatives to sponsor it.)

The public interest aroused by "the lady Senator" often proved irksome. "Sometimes," Mrs. Caraway once chuckled, "I'm really afraid that tourists are going to poke me with their umbrellas! And yet there's no sound reason why women, if they have the time *and ability*, shouldn't sit with men on city councils, in state legislatures, or in the House and Senate. . . .Women are essentially practical because they've always had to be. From the dawn of time it's been our job to see that both ends meet. And women are much more realistic than men, particularly when it comes to public questions. Of course, having had the vote for such a short time is a distinct advantage, for we have no inheritance of political buncombe."

In 1944, after thirteen years in the Senate, Hattie Caraway did little campaigning for the renomination. But her four opponents did. One of them, former Governor Homer Adkins, had a powerful political organization behind him, and another was a colonel. A third, Representative J. W. Fulbright '43, was not only "young, well-educated, handsome, well-to-do, and friendly as an Arkansas hound pup"; he had also made a national reputation during his first term in Congress in connection with the short resolution which committed the Congress to international cooperation. In the Arkansas primary that summer Hattie Caraway was a poor fourth, and at the runoff primary Fulbright was chosen to succeed her. When the Seventy-eighth Congress held its last session, on December 19, 1944, Mrs. Caraway's voice was heard only at roll call; but, on the motion of Senator Carl A. Hatch '44 of New Mexico, the Senate rose in tribute to her, an act reporters described as "almost without precedent." Mrs. Caraway, who was then nearly sixty-seven, admitted later that when legislation "has been your whole life for thirteen years, you feel kind of lost" without it. She had, however, no intention of retiring, but hoped for a job, preferably in the Department of Agriculture or Commerce, where she could put her legislative experience to use. And in early 1945 President Roosevelt sent her nomination to the Senate as a member of the Federal Employees Compensation Commission, a nine-thousand-dollar-a-year position.

In spite of her years in the National Capital, ex-Senator Caraway remains the same conservative figure. To quote her admirer George Creel '44: "Even without her own confession of domestic tastes, Mrs. Caraway would stand convicted on the strength of her looks: graying hair, parted in the middle and drawn back into a plain knot; a figure that scientific diet has never cabined, cribbed, nor confined; comfortable, roomy clothes, and a sense of complete capability, joined to an air of invincible placidity. While talking to her—as nice a way to pass an hour as could be imagined—one ex-

CARAWAY, HATTIE W.—*Continued*

pects her to start shelling peas at any moment, or else ask judgment on a batch of bread."

CASADESUS, ROBERT (MARCEL) (kȧ-sȧ-dȧ-zü′ rô″bâr′) Apr. 7, 1899- Pianist; composer

Address: b. c/o Arthur Judson, Inc., 113 W. 57th St., New York City; h. 32 Edgehill St., Princeton, N. J.

ROBERT CASADESUS

In France the name of Casadesus is renowned in the music world. In the United States it has become famous through Robert Casadesus, pianist and composer. He is "one of the most remarkable pianists of our day" and the "most self-effacing and honest of artists," says Jerome D. Bohm of the New York *Herald Tribune*; "one of the few virtuosos who have nothing in mind but the veracious conveyance of the composer's message."

Nephew of three famous musicians—Francis Casadesus, director of the American Conservatory at Fontainebleau (1918-22), Henri Gustave Casadesus, founder of the Société des Instruments Anciens of Paris, and Marcel Louis Casadesus, a cellist of international note—Robert Marcel Casadesus was born in Paris, April 7, 1899, the son of Varnay and Robert Casadesus. Since his mother had died at his birth and his father, an actor, was frequently on tour, he was brought up in his grandparents' home. His aunt, Rose Casadesus, the celebrated Parisian concert pianist, gave him his first piano lessons. Later, at the age of eleven, he began to study at the Paris National Conservatoire, winning the first medal in solfeggio the same year. In 1913 he was awarded the first prize in piano, and in 1919 the first prize in harmony. A year later he received the Prix Diémer and, with it, recognition as one of the foremost pianists of the day. At the conservatory he was the pupil of Louis Diémer, the famous pianist, and of Xavier Leroux, composer and former pupil of Massenet.

Casadesus says he began his career as a pianist in 1917, with a debut in Paris. Performances throughout Europe followed, and with each season he gave recitals in more distant lands, his tours taking him to Africa, Asia Minor, North America, and South America. In addition, he was professor of musical interpretation at the Conservatory of Genoa in 1929-30 and at the Conservatory of Lausanne in 1931-32. In 1935 he succeeded Isidor Philipp as head of the piano department of the American Conservatory at Fontainebleau, where he remained until the outbreak of the Second World War. Casadesus then brought his family to America. During the summers that followed he continued to teach—in 1940-41 at St. George's School, Newport, Rhode Island, and subsequently at the American counterpart of Fontainebleau at Great Barrington, Massachusetts, a school of music which Casadesus and his wife now conduct every summer.

On January 20, 1935, Casadesus made his American debut as a soloist with the New York Philharmonic Symphony, Hans Lange conducting. According to David Ewen, Toscanini '42 was in the audience and was so impressed by the performance that he urged Casadesus to appear as soloist with him the following season. Since that time the pianist has been soloist on numerous occasions with the Philharmonic and has appeared with the major orchestras all over the world.

Of a concert Casadesus gave after he came to the United States in 1940, a critic said: "Mr. Casadesus, one of France's foremost pianists, gave an admirable interpretation of the Mozart [*Coronation*] Concerto, possessing the clarity of style . . . essential for this music . . . as well as the combination of . . . delicacy and vitality." That same year, after a recital at Carnegie Hall, Howard Taubman of the New York *Times* observed that Casadesus is a mature musician who emphasizes what he thinks the music has to say rather than his own gifts as a virtuoso. "The Mozart Fantasie in D Minor was played with refinement of style that did not become artificial. . . . Perhaps the finest achievement of the evening was Schumann's *Kreisleriana* . . . the piano sang, and the tone glowed with the shifting hues that Schumann knew how to paint. Mr. Casadesus is a master of color, and this performance was the measure of his mastery." Olin Downes '43 has also written of the clarity, brilliancy, and taste of Casadesus' playing, and Louis Biancolli, in speaking of the pianist's flawless technique and tone, ranks him among the top five masters of the keyboard.

Although he is renowned for his interpretation of Mozart, Casadesus does not confine himself to a limited repertoire. In 1941 Irving Kolodin wrote in the New York *Sun*, "The recital by Robert Casadesus last night could be honored with the most telling of compliments . . . it was in a class by itself. . . . Mr. Casadesus started from the premise that this [the Sonata in B Minor] was the work of the manly genius of Chopin, rather than of the sick; and he had every resource of tone, technic, imagination, and scholarship to make that attitude the inescapable one for the work." Of his interpretation of Beethoven's *Emperor* Concerto, Virgil Thomson '40 observed, "Never an accent out of line; never a stress but for rhetorical reason. . . . His was an extraordinary performance . . . extraordinary for its beauty, its power, its physical perfection, its intellectual distinction." He again played this concerto with the New York Philharmonic Orchestra at a Red Cross benefit in April 1945, once more eliciting high praise from the critics—"beauty and poetry and vivid expression," "highly distinctive", "mellow and winning . . . and altogether competent in technical detail", "color gradations exquisitely modulated."

At a concert in Carnegie Hall in January 1945 marking the tenth anniversary of his first appearance in America, Casadesus brought high praise from the critics for his performance of the second book of Preludes by Debussy: "Here was pianism of the highest order. . . .It would be difficult to imagine a more exhaustive, magical mirroring of Debussy's fantastic creation." "He was never more fully a great master of the keyboard. . . . His absolute control of tone was above praise . . . marvels of technical skill . . . extraordinary insight and communicativeness." "He achieved so much beauty of texture, variety, delicacy, and subtlety of nuance as to make his performance thoroughly gratifying." Other concerts, too, have continued to receive equally high praise from critics. One of the great artists of our time," wrote a New York reviewer after a November 1945 concert. Another review at this time read: "Rarely does this pianist do anything but meritorious things. And rarely does he fail to bring the song measures of a number to the fore. Yet in his rendering of the concerto's solo part [Beethoven's Concerto in G Major], he 'threw' most of the lyrical passages away. . . . The only thing lacking . . . was the pulse of song to give the piece its complete life."

Casadesus' family share his deep love of music. His wife, the former Gaby L'Hôte, winner of a Prix Pagès of the Paris Conservatoire, is also a concert pianist. Both pupils of Professor Diémer, the couple met under musical circumstances: Casadesus, with a two-piano concerto he had just composed, arrived one day while Mlle. L'Hôte was receiving instruction. Professor Diémer suggested that the two students play the composition together. The friendship which developed later resulted in their marriage. Two of their three children are well along in their musical education. Jean, the oldest, who is studying the piano, has received a Paris award in recognition of his talent. Thérèse is still too young to choose her musical instrument, but Inez Foster of the *Christian Science Monitor* says that Guy plays both the violin and piano exceptionally well. Of all his performances, Casadesus anticipates most happily the recitals with his wife. Of one of these *PM* commented, "A thoroughly captivating evening of music was presented at Carnegie Hall by Robert and Gaby Casadesus who are both proficient and gifted artists. . . . The program was rendered with both energy and grace." Of the same concert the New York *Times* stated that they played the Mozart Sonata in D Major with a perfection of ensemble rarely heard in two-piano teams. "There were blendings and shadings of tone . . . that gave an individuality and personality to the duet almost never met with . . . except in solo playing."

Casadesus is the composer of many works, which include two violin sonatas, a sonata for piano and cello, three concertos for piano and orchestra, numerous preludes and etudes, two symphonies and two orchestral suites. His compositions are considered as having "positive merit." The etudes were called "worthwhile contributions to contemporary French piano music." Taubman considered five of them, premiered on Casadesus' fifth American tour, as "charming and brilliant . . . light, iridescent, and freshly felt; moreover, they do not take themselves too seriously." Casadesus wrote the *Ballet for the Birth of a Dauphiness*, an eight-part suite, in honor of the birth of his daughter Thérèse, who is called "La Dauphine." Employing a small orchestra in the eighteenth century manner, the Rochester (New York) Philharmonic Orchestra gave it its première in the 1943-44 season. It was called "witty and genial."

In 1937 Casadesus received a gold medal for a concerto for two pianos at the Paris Exposition. That same year he was made a member of the Order of Leopold of Belgium, in 1939 he was awarded the Légion d'Honneur star, and in 1944 an honorary D.Mus. degree from Lawrence College, Wisconsin. In August 1945 Casadesus was appointed honorary lecturer in the music department of Princeton University. His recordings include the C Minor Concerto of Mozart, the "Concertstück" by Weber and other works by Fauré, Scarlatti, and Mozart.

The five-foot-nine musician weighs one hundred and sixty-five pounds. His eyes are blue and his hair blond. Besides giving as many as sixty-five concerts in a year, he follows an intensive schedule of composing, teaching, and practicing, which may keep him at the piano more than eight hours a day. At such times an occasional brisk walk is his relaxation. With his family, he lives in The Barracks, Princeton's oldest Revolutionary house, where one of the neighbors and good friends is Albert Einstein '41. When the physicist comes in for an evening he usually brings along his violin. Such gatherings as these, Mrs. Casadesus points out, show "how music

CASADESUS, ROBERT—*Continued*

binds not only the family but its friends close in a common interest and enjoyment."

CHADWICK, SIR JAMES Oct. 20, 1891- British physicist

Address: b. c/o University of Liverpool, Liverpool, England; h. Otterspool Bank, Aigburth Vale, Liverpool, England

The chief British scientist associated with the atomic bomb project was Nobel Prize winner Sir James Chadwick, who in 1932 discovered the projectile—the neutron—which made uranium fission possible. The eldest son of J. J. Chadwick, he was born in Manchester, England, on October 20, 1891. He received his early education at a Manchester secondary school and in 1908 enrolled in the honors school of the Victoria University of Manchester.

British Official Photo.

SIR JAMES CHADWICK

It was in 1909, during his second year at Manchester, that the student first came under the influence of the famous English physicist Ernest Rutherford, when Lord Rutherford took over a course of lectures in electromagnetism. This proved a stimulating experience for him, he says, as did the research he entered upon in Rutherford's laboratory at the university the next year—"with great joy and, on occasions, alarm and terror." Rutherford was at this time continuing his studies, begun at McGill University in Montreal, Canada, of the properties of the alpha particle, and Chadwick's work for the next four years consisted of problems in this connection. Although the young physicist was awarded his M.Sc. degree in 1911, he elected to remain at the Rutherford laboratory and was thus present both when Rutherford announced his theory of the nuclear structure of the atom in 1911 and when Niels Bohr '45 perfected his quantum atomic model on the basis of Rutherford's and Max Planck's theories some months later.

Chadwick remained at the Rutherford laboratory until 1913. Then, on an 1851 Exhibition Science Scholarship, he went to the Physikalisch-technische Reichsanstalt at Charlottenburg, a surburb of Berlin, where he became associated in radioactivity experiments with Hans Geiger, whom he had met when the latter was Rutherford's assistant in Manchester. (These scholarships are administered by the Royal Commission for the Exhibition of 1851, which was "incorporated by supplemental charter as a permanent commission after winding up the affairs of the Great Exhibition of 1851. It has for its object the promotion of scientific and artistic education by means of funds derived from its Kensington Estate, purchased with the surplus left over from the Great Exhibition.") When the First World War broke out a year later Chadwick was interned in a civilian concentration camp in Ruhleben, Germany. The war years were not entirely lost for him, however, for he and several others managed to obtain permission to set up a makeshift physics laboratory in the camp, where they were able to carry out a bit of experimental work.

When Chadwick returned to Manchester in 1919 Rutherford had just demonstrated his history-making discovery that the nucleus of nitrogen could be disintegrated by alpha-particle bombardment. When a few months later Rutherford succeeded Sir Joseph J. Thomson as Cavendish Professor of Experimental Physics at Cambridge University, he invited his young assistant to accompany him to pursue further the artificial disintegration of elements by alpha particles. Chadwick, who had received the Wollaston Studentship at Gonville and Caius College, accepted, thus beginning a long and close association with his former mentor, whom he has called "the greatest experimental physicist since Faraday." In 1921 Chadwick received his Ph.D. from Cambridge University and was elected a Fellow of Gonville and Caius College. In the course of the next few years he was appointed university lecturer and assistant director of radioactive research in Cambridge's famed Cavendish Laboratory.

In the Cavendish Laboratory Chadwick worked with Rutherford on the artificial transmutation of elements by alpha-particle bombardment and on a series of experiments which probed the size and structure of the atomic nucleus. It was in the pursuit of the former line of attack that Rutherford and Chadwick first noticed the expulsion from the bombarded elements of what appeared to be hydrogen nuclei and thus discovered another of the fundamental constituents of the universe—named proton by Rutherford about 1922. In 1920 Chadwick's quantitative studies of alpha-particle scattering in the bombardment of selected elements provided experimental proof for Moseley's deduction that the electrical charge on the nucleus of the atom was the equivalent of the atomic number. "After the first rapid advances," Chadwick has however written of this period of his investigations, "progress became rather slow owing to difficulties inherent in the method of experiment. But Rutherford never lost his faith in the ultimate success of this work . . . [and about 1928] the development of electrical methods of counting particles enabled many striking advances to be made . . . and the subject of nuclear physics began to open up rapidly."

Chadwick's discovery of the neutron dates from the spring of 1932. For some months he had been following a line of investigation laid down by the German physicists Bothe and Becker of Giessen University and by Jean Frederic Joliot and his wife Irene Curie '40 (the daughter of Pierre and Marie Curie) at the French Institute of Radium. Bothe and Becker had found that the light metal beryllium, when bombarded with alpha particles, gave off an extremely penetrating radiation, which they had tentatively concluded to be akin to the therapeutic gamma rays emitted by radium. Varying the Bothe-Becker experiments somewhat, the Joliot-Curies had obtained even more astonishing results, which, assuming that the phenomenon obtained was a wave of radiation, could not be reconciled with known physical laws. With the aid of an old tube of radium emanation sent to him by the Howard Kelly Hospital of Baltimore—from which he extracted polonium which would give him alpha particles of known voltage—Chadwick repeated these experiments and devised others for purposes of comparison. His subsequent mathematical calculations convinced him that the results obtained could only be explained by the assumption of a particle of mass equal to the proton and having no electric charge—the neutron, the existence of which Rutherford had predicted several years before. Chadwick's discovery not only gave atomic physicists a powerful new weapon with which to explore the atom but also explained the mystery of the excessive weight of atomic nuclei in relation to the number of protons in their composition. In 1932 it brought him the Hughes Medal of the Royal Society and in 1935 the Nobel Prize in physics.

Chadwick left Cambridge University and the Cavendish Laboratory to accept the Lyons Jones Chair of Physics at the University of Liverpool in 1935—two years before he was to write of the death of Rutherford, "The world mourns the death of a great scientist, but we have lost our friend, our counselor, our staff and our leader." About November of 1941 he became associated with "Tube Alloys," the British atomic bomb project corresponding to the American "Manhattan District," and two years later was appointed chief scientific adviser to the British members of the American-British-Canadian atomic bomb policy committee operating in the United States. Since the partial removal of censorship it has been revealed that many British scientists were reluctant to join with him in the project lest they be creating "a planet-destroying monster," and that others, including Chadwick himself, often hoped the bomb would not work.

Sir James, who was knighted in January 1945, has been characterized as a man of "unusual composure," habitually "austere" and reserved. He was married in 1925 to Aileen Stewart-Brown, the eldest daughter of H. Stewart-Brown of Liverpool; the Chadwicks now have twin daughters. Chadwick is a Fellow of the Royal Society, a Corresponding Member of the Sachsische Akademie der Wissenschaften of Leipzig, and a member of the Athenaeum Club in London. Together with Rutherford and C. D. Ellis he published *Radiations from Radioactive Substances* in 1930, and he is author of a number of papers on radioactivity and allied subjects, which have appeared in leading British scientific periodicals.

CHARLOT, JEAN (shȧr″lō′ zhȧɴ) Feb. 8, 1898- French artist; author

Address: h. Toledo 13, Apt. 301, Mexico City

When "master muralist" Jean Charlot went to Mexico in June 1945 he was entering upon the year's fellowship awarded to him in April 1944 by the John Simon Guggenheim Memorial Foundation. One of sixty-nine winners selected from applicants from the forty-eight states of the Union and three provinces of Canada, Charlot, whose fellowship was given in the Latin-American Studies group, will write a history of the beginnings of the modern Mexican school of mural painting, a movement in which he took an active part.

Born in Paris on February 8, 1898, Louis Henri Jean Charlot has a mixed heritage of Spanish, Russian, and French ancestry. His maternal grandfather, Louis Goupil, whose own father had settled in Mexico about 1820, was an officer in the retinue of the ill-fated Emperor Maximilian of Mexico. After his marriage in Mexico City to Sarah Meléndez, of Spanish-Jewish descent, Goupil took his bride to Paris. Their daughter, Anna Goupil, married Henri Charlot, a Frenchman from Russia. The parents of the future artist settled in Paris, but their young son, Jean, who began to draw at the age of three, grew up with the magic of Mexico implanted in his imagination by the art treasures from the New World in his family's possession. "I had," he said at a later date, "a stage country in my head: many feathers, blue, green, and tropical pantomime." Educated at the Lycée Condorcet, young Char-

JEAN CHARLOT

lot went on to the Ecole des Beaux-Arts, where the First World War interrupted his studies; in 1917 he was drafted into the French Army, becoming a lieutenant in the Artillery after he had gone to the officers training school at Fontainebleau. With the Army of Occupation at the close of the war, he remained in Germany until 1920. The paintings of the great German colorist of the sixteenth century, Matthias Grünewald, captivated the young artist, and became a definite influence in his later work. Released from the Army, Charlot, who earlier in his art career had made a number of wood carvings patterned on Breton polychromed folk sculpture, now turned to woodcut and engraving, exhibiting in the Salon d'Automne, in Paris.

In December 1920 the young artist left his native France and went to stay with an uncle in Mexico, where he was eagerly received because of his Beaux-Art training and his skill in the techniques of lithography and wood engraving. He helped to revive interest in "the lost art of wood carving," illustrated books and magazines, wrote critical essays for Parisian and Mexican *revues*, and worked in the open-air atelier of Alfredo Ramos Martínez, "absorbing the country which had been so much a part of the tradition of his youth." Later he participated in the activities of the Syndicate of Technical Workers, Painters, and Sculptors, that short-lived artistic outgrowth of the Mexican revolution, which provided "an epochal opportunity" for an "extraordinary" group of talents—Charlot, Orozco '40, Rivera, Siqueiros, and others. Public works planned by the progressive Government of General Alvaro Obregón afforded wall space for murals. The Minister of Education, José Vasconcelos, directed the Government patronage of artists and in 1921 "a group of idealistic young men began to crystallize around the execution of the program . . . experimenting with the various techniques of encaustic and fresco painting." Freedom as to what and how they should paint was accorded to the artists, with one exception—the subject was to be Mexican. They were not limited in time and were paid a regular daily wage. There ensued a "period of national reconstruction . . . aiming not at individual gain or glory but at the advancement of the group and nation . . . the first collective attempt at mural painting in modern art."

Jean Charlot painted the first fresco (since the colonial era), the *Fall of Tenochtitlán*, in 1922. Representing the sack of the ancient Mexican capital city by the Spanish conquistadors, this fresco occupies one side of the stairway in the Escuela Preparatoria Nacional in Mexico City. The success of the mural, which shows the influence of Uccello and of Leonardo da Vinci, has been attributed to Charlot's sophisticated and complex background. But critics have pointed out that the artist's use of a mixture containing cement, instead of the traditional pure lime, sand, and water, has resulted in a weak coloration because of the necessity of using very thin and watery paint, and that the chemical reaction of the cement has tended still further to reduce the color values. However, the composition is enormously effective, according to Laurence Schmeckebier, "fulfilling at once the requirements of its architectural setting . . . as well as that of a unified pictorial structure." The artist's next murals, painted for the Ministry of Education Building in 1923, are considered to be his best Mexican frescoes. Two panels—*The Washerwomen* and *The Pack Carriers* (a third, *The Dance of the Ribbons,* was destroyed to make room for Rivera's work)—decorate the second patio of the building. Dominated by opposing diagonals, these frescoes are based on a strictly mathematical framework. The influence of El Greco is seen in the decorative use of figures in a surface pattern, according to Schmeckebier, who notes the beautifully modeled forms and amazing brilliance of color, which ranges from shining white, yellow, red, blue, and green to rich purple and velvety black. It was this conception of "dynamic movement of figures crystallized into a decorative mural form" which, modified later by his studies of ancient Mayan art, finally became "the Charlot style."

When the Syndicate lost its patron, Vasconcelos, whose ministry terminated with the 1924 elections, Charlot's work for the Mexican Government came to an end. He continued in Mexico, however, painting and writing, and in 1925 became the art editor of *Mexican Folkways.* It was in this capacity that he attracted the attention of the head of the Carnegie Institution's archaeological expedition in Chichen-Itzá (Yucatán), Dr. Sylvanus G. Morley, who in 1926 engaged Charlot to copy to scale the bas-reliefs in the Temple of the Warriors. On his own account the artist copied frescoes in the Temple of the Tigers and the "Nunnery." This work . . . had considerable influence on Chalot's own stylistic development . . . not only in the use of a new Indian type—the continuous nose-and-forehead curve of the Mayan profile—but also in a decorative use of the twisted figure." He remained in Yucatán for three years, then went to Washington in 1929 to work on two monumental books dealing with the expedition. The first volume, *The Temple of the Warriors,* in which Charlot collaborated with Earl H. Morris and others, was brought out by the Carnegie Institution of Washington in 1931. This was followed by *Preliminary Study* *of the Ruins of Cobá, Quintana Roo, Mexico,* in which Charlot collaborated with John Eric Thompson and others, and was also published by the Carnegie Institution, in 1932.

Charlot now began a long series of teaching and lecturing engagements. The first of these was with the Art Students' League, where he lectured on fresco painting intermittently from 1931 to 1941. During this period he also lectured at the Chouinard School of Art, Los Angeles; the Florence Cane School of Art in New York City; the Walt Disney Studios, Hollywood; the University of California, Berkeley; the University of Iowa; Columbia University, New York; the University of Georgia, Athens; Black Mountain College, North Carolina; and Smith College, Northampton. Of these various connections, the most outstanding was the three years, 1941-44, spent as artist-in-residence at the University of Georgia, through a grant of the Carnegie Corporation. Charlot gave "informal art instruction" to the students, who also assisted in the preparation of the three murals the artist completed during his residence. The first of these, officially tagged WAlpb3661 and done in connection with the Government's Section of Fine Arts of the Public Buildings Administration, was the result of an "also-ran entry in a 1940 major mural contest." Done in oil on canvas, four and a half by eleven feet, for the Post Office at McDonough, Georgia, *Cotton Gin* portrays the cotton processing in the district. Charlot found the Negroes "blue . . . to an eye pitched to the terra cotta of Indian Mexico." He also felt inspired to record the date—October 9, 1941—when he "held live cotton in his hand." The next mural project, sponsored by the university, was a fresco, nine by forty-six feet, on the façade of the Fine Arts Building. It occupied three panels above the portico, the subjects being *Plastic Arts, The Theater,* and *Music.* Although several months were required for composition, preparation of the wall, and blocking-in of the design, the actual painting of the fresco took only eleven days—an average of thirty-six square feet per day. Lunch and dinner were served on the scaffolding to Charlot and his assistants, who had to work rapidly because of the quick-drying properties of the medium.

After the completion of the Fine Arts Building fresco, Charlot was invited by Dean John Drewry, of the School of Journalism, to decorate a wall in a corridor of a wing of the Commerce-Journalism Building. Sponsored jointly by the university and the Atlanta *Journal,* the general theme of the mural is the origin and history of reporting. The left panel of "the largest pencil sketch in the world," as the mural was called in its early stages, is entitled *Anno DMI 1519 Emperor Montezuma's Scouts Cover America's First Scoop* and depicts Cortés' landing in Mexico, while the Emperor's "fourth-estaters" busily sketch the strange Spanish weapons and "hitherto unseen" horses. Charlot drew upon the findings of his previous researches for most of the Mexican detail but the steeds of the Spaniards were inspired by a farm horse named Pearl, sketched on the grounds of Black Mountain College in the fall of 1943. The right panel, *Anno DMI 1944 Press and Cameramen Flash on the Spot News. World War II,* shows a demolition squad going into action, with war correspondents jumping with the paratroopers, typing copy, and taking "candid" shots. For data Charlot visited a paratroop training school at Fort Benning, where he went to maneuvers every day for four days. In a smaller panel, placed over the entrance to the journalism reading room to connect the two murals on either side of the doorway, is the draped figure of a woman symbolizing Time. The results of Charlot's experiences in Georgia were set forth in a book, *The Charlot Murals in Georgia,* published by the university in the spring of 1945. In addition to the detailed account of daily activities, Charlot gives formulas, palettes, historical and technical discussion of fresco, the approach of the muralist as distinguished from that of the easel painter. The book is illustrated with photographs showing the murals in every stage of progress.

Although known chiefly as a muralist, Jean Charlot has had great success as an easel painter. His work was introduced to the North American public in 1923, when he exhibited with the Independent group in New York City. In 1925 he exhibited in the Mexican Section of the Pan American Exhibition at Los Angeles, and in 1928 the Mexican Government sent his paintings, together with work of other Mexican artists, to the group show held at the Art Center in New York. More than fifty one-man shows followed. *Parnassus* called an exhibition at the John Levy Galleries in 1931 "one of the most exciting shows of the season" and described certain paintings—*Bathers, Idol, Nude Reclining,* and *Luciana*—as "literally dazzling." An original and individual painter, Charlot was said to "combine the vitality of the baroque with the simplicity of the primitives." Carlyle Burrows noted the brusqueness and direct quality of his Mexican figure subjects in a later exhibition (1936) and the "curious grotesqueness" of his informal studies of women and children. A series of religious paintings, *The Mysteries of the Rosary,* in this exhibition had highly emotional color, but, according to James Lane, lack of religious sensitivity. In 1938 an exhibition of water colors at the Passedoit Gallery attracted attention for their monumental quality and resonant color. "His figures," wrote Martha Davidson in *Art News,* "seem chiseled out of rock of heroic scale, and they have the solidity, the magnitude, and the expressive force of their Mayan-Aztec ancestors." Outstanding papers included *Tortillera, Preparing for the Dance,* and *Philosopher.* Among canvases shown at the Bonestell Gallery in 1940 the critic of *Art News* singled out *First Steps* and *Market Place* for their experimentation in geometric form, and the "coloristic triumph" of *Interior* and *Nativity.* Father M. A. Couturier, of *Liturgical Arts* Magazine, pointed out, in an introduction to the catalogue, the impacted volumes, saturated colors, and mingling of violence and buffoonery in the religious paintings in the show, as well as the tender and childlike quality of the heroic *bambinos.* Charlot's last group of paintings at the Bonestell in April 1945 were mainly of folk festivals and biblical subjects. Maude Riley, in *Art Digest,* noted a "mural quality of flatness and carrying power" in two large canvases, *Dance of the Malinches* and *Mexican Kitchen.* The critic of the New York *World-Telegram*

CHARLOT, JEAN—*Continued*

considered a series of small paintings relating incidents on "The Flight Into Egypt" to be austerely and sophisticatedly put together, with rhythms established by repeated patterns and stirring harmonies produced by unrealistic colors. The informal subjects—*Rest on the Flight Into Egypt With Angels Washing, Rest on the Flight Into Egypt With Angels Cooking, Rest on the Flight Into Egypt With Joseph Unsaddling*, et cetera—give an idea of the "ingratiating" quality of this series. In October 1945 the Children's Room of the New York Public Library arranged a Charlot exhibition, stressing the artist's work in the juvenile field. In addition to paintings, colored lithographs and a number of books illustrated by Charlot were displayed.

Throughout his career the artist has been an enthusiastic print-maker. A portfolio of his black-and-white woodcuts, *Way of the Cross,* was brought out in France in 1920. Later, in collaboration with Albert Carman, he patented a color lithographic process. A collection of thirty-two of his chromolithographs, with inscriptions by Paul Claudel, was brought out in a second portfolio, *Picture Book*, published in 1933. Edward Alden Jewell found the forms bizarre and the message sometimes cryptic, but praised the "arresting and admirably orchestrated" color. He noted also that many of the social vignettes were "instinct with an understanding, a sense of human dignity and humor and pity that lift them into a realm of enduring significance." A third portfolio, of black-and-white process prints, also entitled *Way of the Cross,* appeared in 1938.

Charlot has been a fluent writer of critical and historical articles on art, contributing to many American and European periodicals. In addition to his books on the Mayan excavations and the Georgia murals, he is the author of *Art From the Mayans to Disney* (1939), a collection of essays, and *Catalogue of Prints* (1937). He has also illustrated twenty published books, among them *The Book of Christopher Columbus,* a lyrical drama by Paul Claudel, published in 1930; *The Sun, the Moon and a Rabbit*, by Amelia Martínez del Río (included in "Fifty Best Books of 1935"); *Characters of the Reformation* (1936), by Hilaire Belloc, with twenty-three portraits; *Tito's Hats* (1940), by Melchor G. Ferrer; Shakespeare's *Henry VI* and Prosper Mérimée's *Carmen,* published by Limited Editions in 1940; *The Story of Chan-Yuc* (1941), by Dorothy Rhoads; and *A Child's Good Night Book* (1943), by Margaret Wise.

Honors to Jean Charlot, besides the Carnegie Corporation grant in 1941 and the Guggenheim fellowship in 1944, comprise inclusion in "Among the Fifty Best Prints of 1929-1930" and "The Fifty Best Books of 1935." He is represented in the Uffizi Gallery, Florence; the British Museum, London; the Metropolitan Museum of Art, and the Museum of Modern Art, New York; the Phillips Memorial Gallery, Washington; the Walker Galleries, Minnesota; museums in Chicago, Philadelphia, and Rochester; and private collections.

On May 26, 1939, Charlot was married to Dorothy Zomah Day, of Brigham City, Utah. They have three children, Ann Maria, John Pierre, and Martin Peter Day. The slight, hazel-eyed artist, whose dark hair is now graying, prefers fresco painting to all other activities, and admits that the illustration of juvenile books is rewarding only when his own children approve the results. Although French by birth and training, and now an American citizen, Charlot is always associated with the modern Mexican movement in art.

CHASE, MARY (COYLE) Feb. 25, 1907-
Playwright; author

Address: h. 1364 St. Paul St., Denver, Colo.

Mary Chase, the author of the 1944-45 Pulitzer Prize comedy, *Harvey*, is a playwright with Celtic pookas and banshees in her pen. To provide the middle-aged protagonist of her play with a needed escape from reality, she invented Harvey, the perfect companion, an invisible white rabbit, six feet one and a half inches tall. One of the admirers of Mrs. Chase and Harvey has observed that the two have many attributes in common: "Both are genial, gentle, tolerant, and wise—and each share an Irish background."

Mary Chase, née Coyle, was actually born far from Ireland—in West Denver, Colorado, on February 25, 1907. However, her mother, Mary (McDonough) Coyle, had come from Ulster County at the age of sixteen to keep house for her four brothers, Peter, Timothy, James, and John, who in the eighties were trying their luck in the Colorado gold fields. Her father, Frank Coyle, had drifted to Denver after an unsuccessful attempt to reap a fortune in the Oklahoma land rush. After his marriage to Mary McDonough he became a salesman for a Denver flour mill. Although all of young Mary's four uncles were "men of talk and long memory," it was Timothy, who had attended Trinity College in Dublin, who captured her imagination with his tales of Irish folklore.

"I got the highest grades for studies and the lowest for deportment," the playwright has said of her years in Denver's elementary schools. She had the reputation of being a tomboy, and a book-lover, too. At the age of eight she read *A Tale of Two Cities*, at ten chose Thomas De Quincey for her favorite author (principally because his name attracted her), and at fifteen began Xenophon's *Anabasis* in the Greek. That year, 1922, she was graduated from the West Denver High School and entered the University of Denver, where she remained two and a half years before she went to Boulder to attend the University of Colorado. During summer vacations she served her apprenticeship as a reporter on the *Rocky Mountain News*, without salary.

At the end of a year at Colorado the future prize-winning playwright, who had completed a major in the classics in two years, gave up her formal schooling to accept a reporter's job on the *News*, this time with salary. John P. Lewis, then city editor of the Denver paper, has said of her work there: "Mary, like all girls on smaller papers around the country, did society and club notes and things like that, and finally was taken over on the city staff to be a sob sister. . . .In the sob sister's life, by the rules of this tradition, were the more infantile and more unpleasant chores in journalism . . . never being sane and normal but always writing highly artificial tragedy or forced humor. . . .Mary didn't take things very seriously on the surface, and we used to wonder if she would ever grow up. More recently some of us who knew her then have begun to suspect that maybe she grew up sooner than the rest of us." "She had the bland, amoral effrontery of a good aggressive cityside reporter," writes Wallis M. Reef, and a "flip, sharp tongue which contrasted nicely with her Madonna appearance." While she was with the paper the young reporter was fired three times, but co-workers say that this was nothing unusual; everyone on the *News* staff was fired at least twice.

Before her third departure from the paper Mary Coyle had been married, on June 7, 1928, to Robert L. Chase, "a tall serious-minded reporter" on the *News*, who is now managing editor. After she stopped working she found herself busy doing all the things she had always wanted to do, and she refused offers to return to the paper. Reef, radio news editor in Denver and a friend of the Chases, declares that in addition to her special interest, writing plays, she managed to "stay involved in about a half-dozen occupations, each of which would have been full time for anyone else. She aided in forming a chapter of the American Newspaper Guild, she handled publicity for NYA [a Government project of the depression period], and, with Mrs. Edward P. Costigan, widow of the late Senator from Colorado, fought for the rights of the Spanish-Americans in Denver, who had been getting kicked around. All this was done with a gaiety that astounded some of her dead-serious associates. She was likely to show up in a picket line wearing a fifty-dollar hat fantastic earrings, and a dress best described as slinky. The effect on employers was amazing. At one time," continues her biographer, "she was running a quiet and effective lobby for an oleomargarine concern and writing a weekly radio program for the Teamsters' Union. The group of people whose activities seem to revolve about Mrs. Chase would, on a chart, be a sort of vertical section of Denver's social and economic life."

Mrs. Chase's interest in the theater had begun at the age of eleven. At that period, in order to attend a matinee at a Denver theater she would play truant from school and walk the five miles from her home to save the carfare. Although her first writing took the form of the short story, her goal was always playwriting. When the New Deal added the Federal Theater to the WPA projects, Mary Coyle Chase, an ardent admirer of the late Franklin Roosevelt '42, saw her first play produced. The play, *Me Third*, was a comedy concerned with a Western politician whose campaign slogan was "God First, the People Second, Me Third." The WPA production attracted the attention of Broadway producer Brock Pemberton '45, and, in 1937 he brought it to New York under the title *Now I've Done It*. Although the play failed to win the support of either press or public, Pemberton encouraged Mrs. Chase to continue with her writing.

MARY CHASE

Among the plays that Mrs. Chase wrote after the political satire was *The Banshee*, a tragedy based on the legend of the Irish spirit who warns families of an approaching death. The manuscript was well thought of by critic friends, but Pemberton, who saw it after the beginning of the war, advised that production of the play be postponed until after the war. It was shortly after this that the playwright, seeking an escapist plot, conceived the idea of *Harvey* (originally *The White Rabbit*), which kept New York audiences smiling long after its première in November 1944.

Briefly, the theme of the play is: It is better to be zany and amiable than to be sane and disliked. Elwood P. Dowd, the central character (played by Frank Fay '45), although "mildly potted all the time," is an inebriate of good morals, good taste, and good manners, as is also his pooka friend and drinking companion, Harvey, the white rabbit. The respect with which Mrs. Chase handled the psychotic Mr. Dowd may have been prompted by advice given to her by her mother: "Never be unkind or indifferent to a person others say is crazy Often they have a deep wisdom. We pay them a great respect in the old country, and we call them fairy people, and it could be they are sometimes." It took Mrs. Chase two years to

CHASE, MARY—*Continued*

write the play, working after her three children, Michael, Colin, and Jerry, had gone to bed and her husband, whose hours are from 5:00 P. M. to 1:00 A. M., had gone to the office. (She works with a four-foot miniature stage.) "I rewrote it fifty times," says the author. "My pooka [spirit in animal form] was represented at first by a canary; when I changed it to a rabbit of man's size, although the change had its advantages, the situations required more delicate handling." Pemberton reports that Mrs. Chase never lacked faith in the play, and that she proved throughout its preparations for Broadway to be "an adroit playwright who knew her material upside down and inside out." The awarding of the Pulitzer Prize for *Harvey*, however, came as a surprise to Mrs. Chase. Her husband received the news over the wires at his office and hurried to a movie theater where he knew she was. When he told her, reports *Variety*, she screamed so loudly that she nearly started a panic in the theater.

Among the New York critics, on the other hand, the announcement of the award met with a divided reaction. A few felt that while *Harvey* was an extremely pleasant play, it was not an example of distinguished writing. The others who disapproved saw the comedy as condoning lunacy and drinking, or as a poor attempt to mix fantasy and farce. For the most part, however, the reviewers were enthusiastic over the story, even though many pointed out an unevenness in quality: "Its fresh and imaginative side," commented Louis Kronenberger '44, "is marred by much very routine farce-writing." "The wacky tale," wrote Howard Barnes of the New York *Herald Tribune*, "is certainly my choice for the most endearing and engaging play of the season." "It [Elwood Dowd's Harvey-inspired philosophy] is a boozy acceptance of reality, without complaint, without bitterness, without envy, hatred or ill will," said Burton Rascoe of the New York *World-Telegram*, while Lewis Nichols of the New York *Times* called it "one of the treats of the fall [1944] theater."

In 1941, for the entertainment of mountaineer infantrymen in training at Denver's near-by Camp Hale, Mrs. Chase had written a travesty on the old melodramas, with the addition of song and dance bits. This play, *A Slip of a Girl*, was enjoyed by the soldiers, says its author, "but for some unexplainable reason the USO failed to take it over." One of her short stories, "He's Our Baby," appeared in the April 1945 issue of the *Ladies' Home Journal*. In this story, described as subtly ironic and witty, Mrs. Chase introduced a new technique which enabled her to establish character and motivation with great economy. At the end of 1945 she was working on a book for children, based on *Harvey*.

In October 1945 Mrs. Chase's tragedy, *The Banshee*, was brought to New York, with Fay Bainter as the star. Although the play, reentitled *The Next Half Hour*, had grossed nearly twenty-seven thousand dollars in a week's tryout in Washington, it met with adverse critical comment on Broadway, and producer Max Gordon '43 ended the run after eight performances. An expedition into Irish folklore, *The Next Half Hour* presented a tale of a superstitious mother who "hears the wail of the banshees, foresees impending disaster, and tries to circumvent it." While most of the critics found the play tedious and fruitless, Burton Rascoe wrote that it had "warmth, truth, and tension."

Mrs. Chase is described as "a beautiful woman with wide gray eyes, rich brown hair, and a white, imperious face." Her friends say that although most of the anecdotes told about her are amusing ones, she seldom smiles and there is a hint of melancholy in her eyes. One of the most frequently repeated stories is the one concerning the time the Chases decided they could at last afford to have the house redecorated and invited their three sons and a few friends to draw pictures in crayon on the old wallpaper. These murals were on exhibition longer than planned, however, for more pressing bills delayed the repapering for several months. Mrs. Chase, whose income from *Harvey* was to provide her with more than fifteen hundred dollars a week, says that around her house "money has never been anything you made; it has been merely something you owed."

CHIFLEY, JOSEPH B(ENEDICT) Sept. 22, 1885- Prime Minister of Australia

Address: b. Parliament House, Canberra; h. Bathurst, Australia

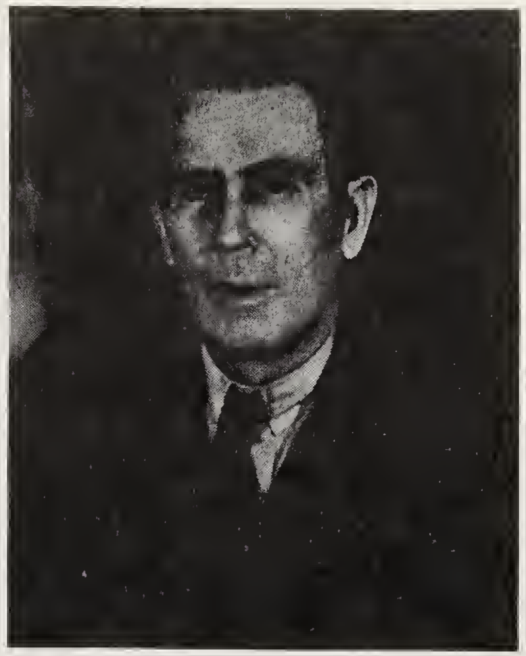
After the death of Australian Prime Minister John Curtin '41 on July 4, 1945, the Australian Labor Party caucus, in what has been called by some observers an unexpected move, elected Joseph B. Chifley Prime Minister to succeed Curtin. Chifley, who entered politics from the ranks of the working class and was Prime Minister Curtin's closest friend in the Government, is a "solid Laborite," pledged to the socialist policies of the Curtin Ministry. Had Curtin been able to choose his successor, observers say he would have nominated "Ben" Chifley.

Joseph Benedict Chifley was born in Bathurst in the hilly western part of New South Wales, on September 22, 1885. His mother and his paternal grandparents were Irish, while his father, a blacksmith, was Australian. At an early age he left school and took a job with the New South Wales Railway, rising in time to the position of locomotive driver on the Sydney-Melbourne express. As a member of the Federated Union of Locomotive Engineers during these years, he developed an active interest in the Labor movement. But before entering Federal politics in 1928, he gave a large part of his time to the study of economics, finance, and industrial law, and he was an advocate for his union in the state and Federal industrial arbitration courts of Australia.

In 1928 Chifley was elected a Labor member of the House of Representatives for the Macquarie, New South Wales, constituency (of which his birthplace, Bathurst, is the center). This was the same election by which Curtin entered Parliament, and it is said that the friendship of the two newcomers began in the House, where they sat together on a back bench. In 1929 Chifley received his first Cabinet post, as Minister for Defense in James H. Scullin's Labor Government. During 1929-30 he was also a member of the Federal Accounts Committee. Then in 1931, together with Curtin and other Laborites, Chifley lost his seat in the general elections that were forced by defections from the Labor Ministry over its financial policy. After this defeat Chifley returned to Bathurst to become a shareholder of the Bathurst *Advocate,* a conservative labor newspaper and to contest, unsuccessfully, for several elective offices.

Although he failed to gain re-election to Parliament for some years, Chifley was not allowed to sever all connections wtih the Government, for non-Labor ministries requested his services. In 1935 Chifley was appointed by Prime Minister Joseph A. Lyons to the Royal Commission on Monetary Banking Systems. It was his investigation as a member of this body that gave him the practical experience on which he was to draw for his banking program while wartime Treasurer of the Commonwealth. In November 1939 Chifley was made a member of the Capital Issues Advisory Board. In 1940 Essington Lewis, then Director General of Munitions in the Cabinet of Prime Minister Robert Gordon Menzies '41 (United Australia Party), sought Chifley's advice on wartime labor problems, later having him appointed to the Ministry of Munitions as Director of Labor Supply and Regulation for New South Wales.

Resigning the last-named post near the end of 1940, Chifley again contested his former seat in the general elections. Branded "Communist" by opponents on the Right, and "Conservative" by the extreme Leftists, he nevertheless was victorious in the balloting, which brought many of his Labor colleagues back to Parliament for the first time since 1931. Although the Labor Party was not yet in power, Chifley's financial knowledge was once more utilized by the Government when it made him a member of the Board of Enquiry into Cash Order and Hire Purchase Agreement Systems of Trading in Australia in February 1941.



JOSEPH B. CHIFLEY

In the course of the next several months the Labor Party repeatedly refused to participate in the formation of a coalition Cabinet, and subsequently, on an amendment to the budget, supported by two independent members, succeeded in bringing about the resignation of the Government. Thus the Labor Party came into power, and with the formation of Curtin's first Labor Ministry in October 1941 Chifley was given the portfolio of Commonwealth Treasurer, for which his fiscal experience made him the obvious choice.

As Treasurer, Chifley designed and guided through Parliament what has been called "perhaps the most comprehensive system of wartime financial controls of any Allied government." His experiences in depression days had convinced him of the necessity for strict governmental regulation of all fiscal policies if economic security for the people as a whole was to be achieved. Hence, as wartime Treasurer, besides increasing taxes and adopting a stringent budget to meet the expenditures of a war economy, Chifley strengthened governmental control over banking and stock transactions and drastically extended price-control measures. In particular, he sponsored two bills which give the Commonwealth Bank, operated by the Government, supervisory powers over the entire banking system and authority to direct financial policies into Government-approved channels.

In 1942 Chifley received from Prime Minister Curtin the additional portfolio of Minister for Postwar Reconstruction, which he held simultaneously with the Treasury portfolio until a Cabinet reconstitution early in 1945 gave the post to John Dedman. As announced at the time of the appointment, Chifley's first task was to be the promulgation of a master plan for postwar reconstruction patterned after the Atlantic Charter. Influenced by his own reaction to the depression of 1929 and the succeeding years, he directed his platform toward the betterment of conditions for the "little man," advocating jobs for all who want work,

CHIFLEY, JOSEPH B.—*Continued*

social security measures, slum clearance, and other methods to raise the standard of living, all this to be financed by taxation based on ability to pay. But being a realist, Chifley said: "The Government will plan boldly but it has no starry-eyed dreams of a new world." Then he went to work and by mid-1943 had laid down a program calling for the rehabilitation of agriculture, the decentralization of industry, slum clearance and housing development, water conservation and expansion of electrification projects, improvement of hospital and medical services, and retraining of soldiers and war workers for peacetime employment. In the Labor Party, it has been observed, he leads a group which considered planning for social reform a wartime as well as a peacetime duty.

In the spring of 1945, with Prime Minister John Curtin ill and Deputy Prime Minister Francis Michael Forde out of the country representing Australia at the United Nations conference in San Francisco, Chifley became Acting Prime Minister. Reports agree that it was his capable leadership during these weeks before Curtin's death in July, as well as the Labor Party's hope that his conservative socialistic viewpoint would draw the independent votes to the party's standard in the coming 1946 general elections, which prompted the party caucus to pass over Forde and elect Chifley by a 3-to-1 vote. (In the Australian Labor Party a caucus is formed by representatives of the party from both the House of Representatives and the Senate, and its decisions are binding upon all Labor politicians.) To some persons the result of the election came as a surprise, as is evidenced by a pre-election report from a New York *Times* correspondent in Melbourne. "Expert observers," he wrote, "believe that against Mr. Forde, nobody will really be in the race."

The new Prime Minister, who had only reluctantly agreed to offer himself for party leadership at former Prime Minister Scullin's urging, retained the Treasury portfolio. He pledged himself to continue Curtin's socialist policies, many of which he had helped to frame, and to carry out his program for improving the Australian standard of living, for which he is said to have "concrete plans." In the sphere of international affairs, he believes in unity within the British Commonwealth and in Australo-American cooperation. "America," he says, "is the dominating Pacific power bound to keeping the peace in this vast area. Australia is a Pacific power. The people of the two countries will and must work side by side."

Chifley has a reputation for calm judgment and practical realism. As Commonwealth Treasurer, with the task of handling war finances and promoting a strict over-all economy, he won the respect of bankers, Treasury officials, and the Australian people. Parliamentarians say of him: "Give Ben time to light his pipe and take a few puffs and he'll solve any problem you put to him." In fact, problems during the last five years were solved as he and Curtin strolled, smoking the while, down Canberra's tree-lined streets. The man who now guides Australia toward socialism, in the belief that capitalists are merely "ordinary blokes" who will eventually accept socialism and even like it, has been described as a hard and conscientious worker, unflinching in his adherence to his convictions. Although "not an outstanding orator in the sense of brilliant rhetoric," he has a deep, somewhat rasping drawl which, with his deliberate manner and direct approach to the subject, holds his audiences. Tall and gaunt, with his pipe clenched between his teeth, he is a cartoonist's delight. His years on the railroad have left their mark in his complexion, in his eyes which show the effect of hours of gazing at glistening rails. He married in 1914 and owns a small home in Bathurst.

CHRISTIANS, MADY (mā-dē) Jan. 19, 1900- Actress

Address: b. c/o Michel Mok, 1545 Broadway,
New York City

Since the early thirties the Viennese-American actress Mady Christian has enjoyed a well-established prominence in Europe and America, both on the stage and in motion pictures. In addition, she has appeared on radio programs and has lectured widely on the theater.

Marguerita Maria Christians was born January 19, 1900, in Vienna. Her father, Rudolph Christians, was well known in Europe as an actor and manager; her mother, Bertha (Klein) Christians, was an opera and concert singer. The family came to the United States in 1912, to New York, where the father managed a German repertoire company at the old Irving Place Theatre. Young Madi was educated privately. (Little Viennese girls are affectionately known as "Madi," and their brothers are "Bubi," like the American "Sis" and "Bud." The Christians continued to call their Marguerita "Madi," which was changed to "Mady" during subsequent tours of the Continent with theatrical companies.)

When she was sixteen Madi persuaded her father to allow her to play the heroine of one of his productions. Under the name of Eva Seetzen, she appeared in a one-act operetta, *Brüderlein fein*. After her first performance Christians said to his daughter, "Madi, I think you'd better get married." On the other hand, a reviewer who saw her in this difficult role (she played both an old woman and a seventeen-year-old bride) predicted that the young girl had a rosy future. "She is tall and slender, unusually pretty, vivacious in manner, sings charmingly in a sweet, well-trained soprano, and speaks English without an accent," he added.

In spite of her father's opposition, Madi was determined to become an actress. Her mother was sympathetic with this desire and did not allow her to become discouraged. In 1917, having given up her own career to devote her energies to her husband and daughter, Mrs. Christians took Madi to Europe, where she was enrolled in Max Reinhardt's school of acting. According to Elizabeth Valentine of the New York *Times*, "it was four years before anyone except Max Reinhardt and her mother thought there was any use bothering with her. . . .Mrs. Christians persisted; if her daughter wanted to be an actress so badly, then she would become one. Without her intelligent support, Madi would probably have quit."

Miss Christians made her professional debut under Reinhardt's aegis in Molière's *l'Avare,* at the Deutsches Theater in Berlin. Her performance was a failure, but Reinhardt encouraged her to continue as his student. After three years of discouragement, she suddenly blossomed into a full-fledged actress when she played opposite the great Italian actor Alexander Moissi in Tolstoi's *The Light Shines in the Darkness.* When Reinhardt refused to extend her contract in keeping with her new status, Miss Christians left his company and joined Ferdinand Bruckner's cabaret Schall und Rauch (Sound and Smoke). Within two weeks she was the star of the show, whereupon Reinhardt offered her a new contract on her own terms. The actress accepted, and remained under Reinhardt's management for five years, appearing all over Europe in as many as forty-five plays a year.

Appearing in both classical and modern works, Miss Christians soon became popular with Continental audiences. She acted in plays by Shakespeare, Lessing, Goethe, Molière, Lonsdale, Pirandello, and others. Gifted with a good soprano voice, the actress also played musical comedy roles. In Europe, too, she was the lead in almost sixty films, including *Glass of Water, Waltz Dream, Queen Louise, Burning Heart,* and *The Empress and I,* with Maurice Evans '40. She made German, French, and English versions of *Dich hab ich geliebt,* and in 1933 she was the star of the film *Friedericke,* which had a musical score by Franz Lehár. Lehár had known Miss Christians for many years, and had called her "my little fiancée" since she was four. *Who's Who in the Theatre* reveals that in 1931 the Viennese actress was touring the United States in *Marching By,* which she left before it reached Broadway.

The year 1933 found Miss Christians performing in Berlin as the Nazi tide began to rise. She says now that she became acquainted with the machinations of the Gestapo when the secret police dispersed a meeting of actors who planned to protest the Nazi domination of the theater. Later in the year she came to the United States. The newspapermen who interviewed her upon her arrival reported that this "luxuriantly blond Brünnhilde" told them she was "married fine" to Dr. Sven von Mueller, editor of a Hamburg newspaper. They have since been divorced, and Miss Christians has returned to Germany only once, to attend her mother's funeral in 1938. In 1939 she became an American citizen. "I am, first of all, an American actress," Miss Christian declared, "and I insist upon being listed and considered as one. Of European background, yes, but primarily and basically an American actress."

Lucas-Pritchard

MADY CHRISTIANS

Back in the United States, the actress began a long unbroken streak of bad luck. She gave "a rich and sincere" performance in *The Divine Drudge,* adapted from a novel by her close friend Vicki Baum, but the play was a dismal failure. Reviewing Miss Christians' Broadway debut in this play, Brooks Atkinson '42 remarked, "It would be worth sitting through fifty bad plays to see her perform." As though to test him, there followed two more "quick flops," Rachel Crothers' *Talent,* and the Theatre Guild's *Races* (1934). In 1934 Miss Christians did radio work and appeared as the bedraggled mother of seven children in the motion picture *The Wicked Woman* (MGM), a story of misery in a Texas swamp "which since has caused Miss Christians to view all swamps and much of Texas with a feeling akin to a sharp attack of malaise."

Nevertheless, after 1934 she divided her time between the film capital and Broadway. In February 1936 she played the title role in *Alice Takat* (Ed Wynn's '45 production "folly"), which ran for eight performances. That year also she played with Edward Arnold in the film *Come and Get It* for United Artists. In 1937 she appeared in *Seventh Heaven* (Twentieth Century-Fox)—as a street cleaner's wife—Paul Muni's '44 *The Woman I Love* (RKO), and *Heidi* (Twentieth Century-Fox), in which she slapped Shirley Temple's '45 face.

She returned to Broadway early in 1938 in George S. Kaufman's '41 comedy *Save Me the Waltz,* another eight-performance failure. Later, in the spring, she had the important part of Hesione Hushabye in Orson Welles's '41 production of Bernard Shaw's '44 *Heartbreak House.* The actress found Welles a dynamic director with an intellectual approach to the play.

Then in October 1938 Mady Christians opened in one more queen's role, Gertrude in Margaret Webster's '40 production of *Hamlet.* With Maurice Evans in the title role, this uncut version of the Shakespearean drama was very popular with Broadway audiences. The critics were unanimous in their praise of Miss Christians' performance, their reviews abounding in superlatives. John Mason Brown '42 declared that Miss Christians gave to the part "a brand

CHRISTIANS, MADY—*Continued*

new tragedy which the text has always demanded in vain. She is warm . . . attractive, interested, and queenly . . . capable of tragedy in the closet scene and coquetry throughout." In complete agreement, Brooks Atkinson stated: "Mady Christians' frightened, tortured, grieving queen is the best one this theater-goer has ever seen."

Miss Christians' next play was also a Webster-Evans production: in early 1939 she opened in *Henry IV*, as Lady Percy—called "one of the most vivid characters that Shakespeare ever created in so small a compass." Her scenes with Wesley Addy as Hotspur were described as "an exquisite mixture of tenderness and humor . . . a charming interlude of domesticity almost in the Noel Coward '41 manner."

In 1939 also, the star played Hedda Gabler (one of her European roles) for Talking Book recordings of the Ibsen play, distributed by the Library of Congress for use by the blind. This was the first time that such recordings were done by theatrical stars instead of "straight readers." In 1941 the actress appeared in the brief run of the play *The Lady Who Came To Stay*.

When Lillian Hellman '41 wrote her powerful drama *Watch on the Rhine*, Miss Christians was given the leading role. This former favorite in the Berlin theaters was cast as Sara Müller, the American-born wife of a German anti-Fascist. The play opened on Broadway April 1, 1941. It was a triumph for the author and performers; with Paul Lukas '42, the male lead, Miss Christians earned high critical commendation. In the opinion of Brooks Atkinson, "Mady Christians' Sara Müller is full of womanly affection and a crusader's resignation to realities." *Watch on the Rhine* itself fared well, too, winning for its author the annual award of the New York Drama Critics' Circle. It was also listed among the best plays of the 1940-41 season by Burns Mantle '44.

In 1943 Miss Christians lectured on the theater in the hinterland. That year she also appeared in the motion picture *Address Unknown*, again playing opposite Paul Lukas. This was the film version of Kressman Taylor's best seller, another anti-Nazi drama which dealt specifically with Nazi corruption. While in Hollywood Miss Christians also played in *Tender Comrade* (1944), starring Ginger Rogers '41. This picture, in which she had a small part as a housekeeper, received unfavorable reviews.

When Miss Christians read Kathryn Forbes's '44 stories about "Mama," titled *Mama's Bank Account*, she was enthusiastic about them. Then, when she heard that Richard Rodgers '40 and Oscar Hammerstein '44 were going to produce a play based on these stories, she wrote to each of them, asking for the part of Mama. It was somewhat of a coincidence, therefore, that John van Druten '44, after adapting the stories for the play, suggested Mady Christians for the part. (The playwright, incidentally, dedicated the play to Miss Christians.) *I Remember Mama* is a tender comedy-drama about a Norwegian-American family governed by the wise, simple mother. The actress prepared carefully for the role, developing a Norwegian accent by studying with a Norwegian woman who did not realize how marked her accent was. Miss Christians says that she derived most of the feeling for the part from memories of her own mother. A short time after the very successful Broadway première in October 1944, the star remarked: "I'm still walking on air. This is the most beautiful part I've ever acted, except perhaps some of the classics, and to have the part in a beautiful play that is also a hit seems almost too good to be true. It will take me a few weeks to get used to believing it."

The critics were almost as enthusiastic about the play as Miss Christians, and they found many complimentary things to write about her performance, too. In the words of *Variety*, "Mady Christians has been outstanding before . . . but her Mama is superlative." "Most people who see the play will certainly remember Mama, and will be unable to think of her as anyone but Mady Christians," wrote another reviewer. And, as if echoing this, Elizabeth Valentine declared, "In fact, Miss Christians steps over the fine line between acting and being." Writing in the New York *Post*, Naomi Jolles declared that Miss Christians' portrayal of the sympathetic, understanding mother "has made her a truly dimensional figure and audiences have accepted Mama as real, sometimes to the eclipse of Miss Christians." Another critic commenting on the actress' triumph in the part observed that Miss Christians' performance "gets the lusty response it deserves." Burton Rascoe called her performance as Mama the finest of the year. The same critic also named Miss Christians as one of the ten most beautiful actresses of the year. She was awarded the Delia Austrian Medal by the Drama League of New York for the most distinguished performance of the season. The list of previous medal winners includes Katharine Cornell '41, Helen Hayes '42, Maurice Evans, Raymond Massey, Paul Muni, Alfred Lunt '41, Lynn Fontanne '41.

Miss Christians' contract for this play was for a period of at least two years. She studied singing again during that time, and she taught the theory and practice of acting in a course officially named "The Study of Roles and Scenes" at the Columbia University 1945 summer session, to the delight of a class of thirty. Professor Milton Smith, director of the University Theatre, has described Miss Christians as "a brilliant and thoroughly experienced practitioner of the art of the theater."

Questioned about her method of handling a part, Miss Christians has said, "I think it out intellectually first; I make careful research. . . . Little by little during the early rehearsals, I begin to feel it; there is one point there where I am overboard—all emotion—too much—this performance is terrible. After that I taper off; then once again during rehearsals I play it on feeling, and this time it is better. I begin to know how much to let loose. Finally the opening night I am playing mostly on feeling—controlled, of course—the mental understanding of the role acts as a brake and a guide. But once you've hit it right—after that you can do it from memory. It would be impossible to feel a part night after night for months."

Besides her stage and screen performances, Miss Christians has also done radio work, and she has made recordings of plays for the American Foundation for the Blind's Talking Books. She is a member of the Actors Equity council, the union's governing board. Her interests extend beyond the theatrical sphere: on April 18, 1945 she spoke at the International Security luncheon of the Independent Citizens Committee, and in September she joined a committee of Broadwayites backing Eugene Connolly for election to the City Council. In late 1945 she was reported to be working on her autobiography.

One writer has remarked that after seeing Miss Christians as Mama she found the actress' own, or offstage, personality a surprise, for, unlike Mama, Miss Christians has a "quick, rushing manner and talks eagerly and volubly." Radiant with vitality and enthusiasm, she has said: "I like life—the state of the world I do not like, naturally—but I think I am essentially a happy person." She enjoys her small farm in Connecticut, where she raises "too many beans and tomatoes." Long interested in directing, she hopes that some day she will direct young actors and actresses—"The older ones scare me. But the young ones—maybe I can do something for them."

An attractive, smartly tailored woman, Miss Christians has bright blond hair and gray-blue eyes, and has long been described as pretty and sometimes as beautiful. Because of her height (she is about five feet seven inches tall) and her "noble speech and regal bearing," Miss Christians has portrayed many queens: in addition to Gertrude of Denmark, she has played Anne of England, Louise of Prussia, Elizabeth of Spain, the Empresses Maria Theresa and Eugénie, and a number of fictional rulers. Possibly a disadvantage of her height has been that in playing romantic scenes opposite shorter leading men in Europe (where the average height is less than in America) she nearly always had to sit down or drape herself on a convenient piece of furniture. In fact, she claims to have played more scenes in this manner than any other actress.

CHRISTISON, SIR (ALEXANDER FRANK) PHILIP Nov. 17, 1893- British Army officer

Address: b. c/o War Office, London

One of the lesser known leaders of the Burmese campaign in the Second World War, Lieutenant General Sir Philip Christison commanded the first British force ever to win a major victory over the Japanese. In late 1945 he was in a more publicized role as commander of the Allied forces maintaining order in Java and the other Netherlands East Indies, where the Indonesian nationalists had risen in revolt against Dutch colonial rule and declared an Indonesian Republic in August.

Bassano, Ltd.

LT. GEN. SIR PHILIP CHRISTISON

Sir Philip's mother was English, but he comes of a distinguished Scottish family on his father's side. Christison's great-grandfather was Professor of Humanity at Edinburgh University. His grandfather, who also taught there, was Queen Victoria's senior physician in Scotland, and was created a baronet. His father, Sir Alexander Christison, was surgeon general of His Majesty's Bengal Army, one of the first Army doctors to use chloroform. The first of five children of Sir Alexander's second marriage, to Florence Elworthy, Alexander Frank Philip Christison was born on November 17, 1893, eleven years after his father succeeded to the baronetcy. He is now heir presumptive to his half-brother, Sir Robert Christison, twenty-three years his senior.

The future general attended Edinburgh Academy, where he was something of an athlete, and went on to study medicine at Oxford University. He played on the University College rugby team, and also refereed matches. Somewhere in his education, too, "Christy" Christison acquired a good knowledge of Gaelic and of ornithology. In 1914, after the First World War had begun, Christison joined the Royal Army Medical Corps. But, he says, "I was so horrified at the bad tactics of generals in France that I thought, 'Can't I save more lives by being a good soldier than by being a bad doctor?'"

Accordingly, Christison obtained a commission as second lieutenant in the Queen's Own Cameron Highlanders, and went to France with his battalion in August 1914. In the next three and half a years the young officer was mentioned in dispatches, wounded, and twice decorated, winning the immediate award of the Military Cross at Loos, and a bar, meaning a second award, at Arras. In February 1916 Captain Christison was married to Elizabeth Mitchell, daughter of the Bishop of Aberdeen and Orkney.

(Continued next page)

CHRISTISON, SIR PHILIP—*Continued*

Unlike most British officers, Christison has served in a number of infantry regiments. In 1919 he held command of the Seaforth Highlanders' Sixth Battalion, and from 1920 to 1923 and then from 1924 to 1927 he served, respectively, with the King's Own Borderers and the Camerons. In 1929-31 the infantryman had a staff job at the War Office, and was made brevet major in 1930. After two years as brigade major Aldershot Command, Christison was assigned to the Staff College as General Staff Officer 2. In 1937 he was given command of the Fourth Battalion of the Duke of Wellington's Regiment, with the rank of lieutenant colonel. Later that year he was promoted to colonel.

In 1938 Christison assumed command of the Fourth Indian Quetta Brigade in British Baluchistan, a land of deserts and rugged mountains.. He is said to be a great admirer of the Indian soldiers, and he has familiarized himself with their traditions and addresses them in Urdu. While in Quetta the Colonel, an enthusiastic bird fancier, used to set out on a camel as a one-man bird-study expedition: his findings were published as *Birds of Northern Baluchistan* (1940). In 1940-41, with Britain engaged in the European war, he was commandant of the Staff College at Quetta; then the forty-eight-year-old officer was called back to England as brigadier to the General Staff.

Promoted to the acting rank of major general, the Scotsman was given command of the new Fifteenth Scottish Division. This was formed of the remaining battalions of the Highland and Lowland regiments which had been cut to pieces in the Battle of France in 1940. But in December 1941 Japan also declared war, attacked and captured Singapore and Lashio, and infiltrated the British lines in India. Christison was sent back to Baluchistan as general officer commanding. Then, in November 1942, he was given the new Thirty-third Indian Corps to prepare for the jungle campaign in Burma. "For a year," to quote an official release, "General Christison and his officers and men learned the geography of the country, its mountains, jungles, its climate, knowing that when the time came they would have to go 'against the grain'—over the mountains from west to east, not down the valleys running from north to south." In January 1943 he was made a Companion of the Bath, and in that year was promoted to three-star rank (temporary). The General had a special reason for wanting to beat the Japanese, for his only son, twenty-four-year-old Lieutenant John Anthony Alexander Christison, had been killed at the Hlegu Roadblock.

Next Christison was then transferred to command of the Fifteenth Indian Corps (it included the Fifth and Seventh divisions), which went into action against the Japanese in Arakan in November 1943, as part of General Sir William Slim's '45 Fourteenth Army. "When we go forward, we go forward to stay—and the hell with infiltration!" Christison told his men. At that time the Japanese held nearly all of Burma; it was Christison's corps which inflicted their first defeat by British forces. This was at Arakan, northeastern India, in February 1944.

His Seventh Division was cut off and surrounded by the enemy, but (to quote a later citation) "his cheerfulness . . . inspired his whole force," and division commander Messervy formed his troops into the famous British square and stuck it out. For eighteen days this "box" fought off the Japanese, living on supplies dropped by India-based planes. When Christison's Fifth Division came to relieve the beleaguered Seventh, the two joined forces under his leadership, hemmed the Japanese in between them, and hunted down the scattered enemies, killing ten thousand. Between battles in the Arakan jungle, the General found time to note two hundred and fifty different kinds of birds; each of his patrols was also instructed to watch for signs of rhinoceroses, as well as Japanese.

To quote the Southeast Asia theater commander, Admiral Lord Louis Mountbatten '42, "After that victory the Fifteenth Corps, fighting often in the worst conditions on the whole Burma front, secured the necessary air bases and ports from which the victorious advance of the Fourteenth Army over the Chindwin and down the center of Burma was sustained. [Perhaps the best known of these was Akyab, in January 1945.] Finally it was the Fifteenth Corps forces which made the amphibian and air-borne landings south of Rangoon [in May 1945] to capture that city, and set the seal of success upon the Burma operation."

When the Japanese surrender brought the war to an end in August 1945, Christison and the other English, Scotch, Irish, Welsh, Indian, East and West African, American, and Chinese soldiers, sailors, and airmen in the theater had liberated 85 per cent of Burma. That sweltering tropical jungle, incidentally, is host to every communicable disease, and infested also by leeches and poisonous snakes; during the first six months of 1944 there were more cases of illness in the Fourteenth Army than the entire strength of that army, and in the comparable period of 1945, there were six sick men for each battle casualty. When Lord Louis speaks of Christison facing the worst conditions on the front, therefore, it follows that those conditions were impressively bad.

Sir Philip—he was knighted on the field at Imphal in September 1944 as a K.B.E.—took command of the Allied Land Forces in Southeast Asia during the absence of General Slim. He was engaged in reoccupying Singapore and releasing the war prisoners and civilian internees there; later, when assigned the same task in the Netherlands East Indies, he had to cope with the Indonesian Nationalists' revolt against Netherlands rule in September 1945. His job of restoring order Christison described as "walking about a powder barrel, stamping on the fingers of those who are trying to touch a match to the powder."

In a situation where the solution depended to a considerable extent on the personality of the Allied occupying general, Christison, it was reported, seemed determined not to incite the Indonesians. He kept his men in the background as much as possible, and ordered them not to wear any weapons except when on duty. Christison emphasized that it was not his intention to pull Dutch chestnuts out of the fire. "Our only business is to disarm the Japs," he said, "release war prisoners, and, of course, maintain law and order, which is most desirable from our point of view. I expect to be treated as a guest." Ironically, however, the small British force found it necessary to use the available Japanese to help police the Indies, as choosing native or Dutch guards would, the General said, be playing politics. The end of October found Christison's men holding out against armed violence, in which a British brigadier was killed, and trying to arrange some peaceful settlement.

On October 31 General Christison announced: "These direct and unprovoked attacks upon British forces cannot in any circumstance be permitted, and unless the Indonesians who have committed these acts surrender to my forces, I intend to bring the whole weight of my sea, land, and air forces and all the weapons of modern war against them until they are crushed." (Prime Minister Attlee '40 had earlier charged that the Nationalist Movement had been sponsored by the Japanese for two or three years.) An ultimatum to the Indonesians in East Java, including the Surabaya naval base, to surrender their arms, expired on November tenth, and Christison's Java forces, under Major General E. C. Mansbergh, began to bomb and shell "known centers of extremist activity," in support of the Fifth Indian Division's advance toward Surabaya. Within a few days the Indians and Indonesians were locked in a bitter house-to-house struggle. The Indonesian president Achmed Soekarno charged the British and Dutch ex-prisoners with massacring an innocent civilian population, and the Allied field commanders stated that the rebels were employing surrendered Japanese weapons in a manner that suggested Japanese influence, and committing atrocities upon men, women, and children. Starvation and suffering were mounting among the Javanese population as a result of the disruption of communications.

In early December, according to United Press correspondent John Bower, the Indonesians controlled most of the communications, and British control in Java was limited to a few spots. Conferences among Christison, Premier Sutan Sjahrir of the Indonesian Republic, and Dutch Governor-General Hubertus Van Mook '42, failed to change the situation, and the (British) Allied commanders in the theater, Mountbatten and Dempsey '44, decided on a policy of employing whatever force might be necessary to overcome opposition. To this end, some of Christison's troops burned down two Indonesian villages, one in retaliation for the massacre of survivors of an airplane crash, and the other after snipers from the village had driven Indian troops from a rail crossing. By mid-December, however, the Allied troops were still outnumbered, although reinforcements were reported on their way to General Christison.

"Christy" to his friends, "The Smiling General" to his Indian troops, Sir Philip is considered by his officers "one of Britain's greatest generals." According to Darrell Berrigan of the New York *Post*, "graying, kindly, studious, unaffected," are the adjectives applied to the tall general. He is a member of the British Ornithologists Union and the Bombay Natural History Society, and one of the first questions he asked the Japanese general in Java was whether his soldiers had shot any of the local rhinoceroses. The versatile Scotsman is said to be "no mean performer" on the cello and bagpipes, a student of Celtic literature and music, a crack shot, an angler, a good athlete, a keen bridge player. His home is in Edinburgh. Sir Philip and Lady Christison have three daughters, Heather Cameron, Alison Ann, and Fiona.

Who's Who, 1945

CLARK, TOM C(AMPBELL) Sept. 23, 1899- United States Attorney General

Address: b. Department of Justice, Washington, D.C.; h. 2101 Connecticut Ave., N.W., Washington, D.C.

The highest law officer of the United States Government is, since July 1, 1945, Attorney General Tom C. Clark. The Attorney General, who shares with one fellow Cabinet member (the Postmaster General) the traditional right to be addressed as "General," heads a department which has been described as "probably subject to more political pressure than any other. It is loaded at all times with potential political scandal." In addition to the classic functions of criminal detection and prosecution, law interpretation, prison supervision, and representing the Government in tax, claims, and customs cases, Clark's Department of Justice handles immigration and naturalization, antitrust prosecution, and is concerned with public lands. In time of war it enforces rationing, priorities, and other wartime controls, as well as prosecutes civil espionage and sabotage cases. And, as Arthur Krock '43 points out in the New York *Times*, "as the President's legal counsel as well as the chief law enforcement officer of the Administration, Attorney General Tom C. Clark will have a great deal to do with shaping legislation, with official courses toward industry, with the character of the Federal bench and bar, and with what may be termed the 'moral climate' of the Truman '45 regime. . . . The attitude and record of General Clark accordingly will have much to do with whatever score for high-mindedness is made by President Truman."

Tom Campbell Clark ("Tom" is not a diminutive, as many think, but his official name), whom President Truman nominated for the Cabinet in May 1945, was born about forty-five years earlier, September 23, 1899, on "the best residential street in Dallas, Texas." The son of Jennie (Falls) and William H. Clark, he is of Scotch-Irish ancestry. Tom's grandfather and father were well known lawyers, active in public affairs and Democratic politics. The boy did well at school and sports, worked on student publications, and attended Sunday school faithfully. (Clark is a Presbyterian.) After studying at the Bryan High School, where he edited the monthly publication, and won debating and oratorical honors, the youth entered the Virginia Military Institute, the private "West Point of the South," where he remained a year (1917-18); in this period he stood forty-sixth in his class of 242 cadets. He next served briefly as a sergeant in the 153d Infantry, and at the end of the First

TOM C. CLARK

World War went on to the University of Texas. At the university he won his B.A. in three years and his LL.B. the next year (1922). (In 1945 he received an honorary Doctor of Laws from the John Marshall College of Law.)

Admitted to the Texas bar in 1922, Clark joined his father and brother in their Dallas law practice. In November 1924 he was married to Mary Jane Ramsey (daughter of a State Supreme Court justice), who had lived in the sorority house next door to Clark's Delta Tau Delta house at the university. (The Clarks have one son, William Ramsey, and one daughter, Mildred.) The likable young attorney became active in Texas politics, and is described as a "political protégé" of Senator Tom Connally's '41 and of Representative Sam Rayburn's '40. With Connally's backing, Clark left private practice in 1927 to enter "that great political school, the D.A.'s office," as civil district attorney of Dallas County. *Newsweek* says that he did not lose a case during his five years there. "A good lawyer doesn't file a suit unless he's sure he'll win," Clark says; and *Time* reports that "among Washington legal eagles he is known for his bulldog tenacity in preparing cases."

In 1932 Clark resigned from his office to re-enter private practice, and spent two years as master in chancery in the Joiner oil litigation. In 1934 his earnings dropped because he spent a great deal of time campaigning for the election of his partner, William McGraw, as attorney general of Texas. According to the report of a Texas Senate investigating committee in 1937 (when McGraw was a prospective candidate for Governor), Clark experienced "a tremendous and startling increase in earnings" after his partner took office. Clark's friends explain that this was because he was again able to turn his full attention to his practice. In January 1935, according to the report, the Texas Petroleum Council engaged his services at a salary of twelve thousand dollars a year. Clark denies that this was for serving as a lobbyist, although he did appear before the State legislature to speak against the chain store tax bill as representative of the Safeway grocery stores. The Texas investigating committee censured Clark for not being "willing and eager to make a full disclosure of his financial affairs," but his explanations proved satisfactory to the Judiciary Committee of the United States Senate when he was questioned, before the unanimous confirmation (on June 14, 1945) of his appointment as Attorney General.

With the sponsorship of Senator Connally and Representative Hatton Sumners, Clark was appointed to the Department of Justice in 1937, as special assistant to the Attorney General of the United States, Homer S. Cummings. First assigned to the Bureau of War Risk Insurance, the rangy Texan was transferred in 1938 to the revitalized Antitrust Division, where he specialized in cases concerning violations of the marketing and wage-hour acts. A year later the dynamic division head, Thurman Arnold '40, sent Clark to New Orleans to take charge of the field office there, and a few months after that made him chief of the division's West Coast offices, with headquarters at Los Angeles. There, according to *Newsweek*, Clark "won a reputation for ending price-fixing in the lumber industry."

One month after the Pearl Harbor attack and the entrance of the United States into the Second World War, Attorney General Francis Biddle '41 appointed Clark coordinator of alien enemy control in the Western Defense Command. The West Coast was alarmed by the presence of the many thousand Japanese (by birth or ancestry) and of the thousands of German and Italian citizens, and in February 1942 President Franklin D. Roosevelt '42 ordered them all to be evacuated from the Pacific Coast military zone. General John L. De Witt '42 was responsible for the evacuation, but Tom Clark was attached to his staff to handle the job and coordinate the work of all the Federal agencies concerned. The situation was a delicate one, for West Coast feeling ran high against the "alien enemies," while civil liberties groups were concerned with the protection of the rights of the sixty thousand racial Japanese who were American citizens, of whom many had relatives in the country's armed forces. Clark managed the job "with firmness and humaneness." Raymond Moley '45 writes, "I was in California when it was under way, and everyone concerned praised Clark's exemplary conduct." The lawyer organized the inland relocation centers, and established the legal machinery to handle the évacués' private affairs.

Clark's relocation work brought him, reportedly, an offer of a colonelcy, but apparently he preferred to return to the Department of Justice. Appointed first assistant to Assistant Attorney General Arnold in the Antitrust Division, the Texan was given charge of the War Frauds Unit in May 1942. There he worked closely with the Special Senate Committee Investigating the War Program, better known as the Truman Committee, often basing prosecutions on facts unearthed by Senator Harry S. Truman and his committeemen. At the end of March 1943, when Thurman Arnold left to become a Federal judge, Clark succeeded him as Assistant Attorney General heading the Antitrust Division. "There will be no witch-hunting, no uprooting of American customs or traditions," he told businessmen, "but there will be practical, swift, hard-hitting law enforcement." (When he became Attorney General two years later Clark again emphasized that the Government planned no program of persecution of business, but a strong enforcement program to maintain fair competition.) He was concerned particularly with preventing cartels (trade barriers set up by private agreement), from lowering the standard of living and from endangering the postwar peace by restricting production for their own profit.

During the five months Clark spent as head of the Antitrust Division the cases he prosecuted included a combination of some large New York department stores in an advertising boycott against a newspaper whose editorial policies they resented. Perhaps the most bitterly contested case was that of the motion picture consent decree, the agreement under which producers, distributors, and exhibitors operated, and under which the division had suspended its antitrust divorcement suits against Warner '45 Brothers, Paramount, MGM (Loew's, Inc.), Twentieth Century-Fox, and RKO-Radio Pictures. According to Moley, Clark "reached a settlement which quieted things, and all parties were sorry when Mr. Clark was transferred to other duties." On the other hand, *Variety*, the organ of show business, reported that after negotiating with the Big Five companies from mid-1943 until early 1944, Clark reported to Biddle that another consent decree could not be worked out, and recommended that the antitrust suit be resumed. This was done late in 1945.

Clark's War Frauds Unit meanwhile dealt with charges that followed the Truman Committee's revelations of the Wright Aeronautical Corporation's methods; of the Anaconda Wire and Cable Company, which admittted supplying defective wire and cables to the United Nations armed forces; and of the indictment, under the antitrust law, of the National Lead Company, its Titan Company, and E. I. du Pont de Nemours and Company "on charges of participating in a world-wide conspiracy to control the production and marketing of titanium compounds," of which 98 per cent of the supply was being used in war products. (In July 1945 it was announced that the Government had won the titanium cartel suit.) "Because cartels are, in effect, private economic super-governments, ruling over whole segments of our economy," said Clark in June 1943, "they were able to divide world markets, to undermine the Good Neighbor Policy by allowing South America to become in many instances the exclusive market of Axis economic interests, and to withhold processes and products necessary for the conduct of the war both from the United States and other members of the United Nations." (Statements like this caused the Assistant Attorney General to be accused by defendants of trying his cases in the newspapers.)

In August 1943, when Clark exchanged positions with Wendell Berge and became head of the Criminal Division, he took his War Frauds Unit along with him, and also the enforcement of priority orders, price control, rationing, and food allocation laws. Those who had hoped his appointment would mean greater vigor in prosecution were not disappointed. Within a few months the Texan had completely reorganized his division to handle the more than fourteen thousand complaints it was receiving each month. *Newsweek* reported that Clark's telephone rang on an average of once every three minutes; "he occupied the hottest legal seat in the country. New York, Los Angeles, and What Cheer, Iowa, may be on the line at the same time with prosecution problems. . . . But no one in the department ever saw Clark get excited or heard him raise his voice."

Up to June 1944 his staff had reportedly won 92 per cent of its war frauds trials; by June 1945 his War Frauds Unit had won 250 convictions and $350,000 in fines. On occasion Clark himself argued cases before the Supreme Court, although only a stern order from his little daughter could make him discard his Western-style attire for the required formal morning dress. According to *Time,* he specialized in civil-rights and peonage cases. While working twelve hours a day ("I have to work long hours because I'm not as smart as some other fellows"), Clark found time to keep his Capitol Hill friendships in good repair, and to listen to the troubles of his division's five hundred workers, send them personal notes at Christmas, and encourage his less-experienced attorneys.

Clark also became president of the Federal Bar Association, which he helped to organize. Drew Pearson '41 writes that he "quit as its head after shocking Southern colleagues by demanding Negroes be admitted"; according to *Newsweek,* however, his enforcement of the wage-hour law in the South "gave due regard for regional conditions." In January 1945 Attorney General Biddle designated Clark, with two assistants, to conduct the prosecution of the spies William Colepaugh and Erich Gimpel, who had been landed from a U-boat on the Maine coast. The eight-day trial, which was conducted by a military commission behind closed doors, ended with the death sentence for both defendants (later commuted to life imprisonment by President Truman). Clark has said that this was his most interesting case.

A year earlier Charles Van Devander and William O. Player, Jr., in their column *Washington Memo,* had written that Tom Clark would succeed Francis Biddle as Attorney General within a month. Actually, it was fifteen months (May 1945) before Clark was appointed, by President Truman, to replace Biddle, and then the news was reported as coming as a surprise to everyone, including the new Attorney General. Commentators traced the appointment to the influence of Democratic National Chairman and Postmaster General Robert E. Hannegan '44, Senator Connally, Speaker Sam Rayburn, and also reminded their readers that Clark had worked with Truman when the latter had headed the investigating committee. Clark's appointment —coincidental with those of Lewis B. Schwellenbach '45, to replace Labor Secretary Frances Perkins '40, and Clinton P. Anderson '45, to replace Agriculture Secretary Claude Wickard '40 —was seen as a step toward replacing Eastern New Dealers by "organization Democrats"

CLARK, TOM C.—*Continued*

from the West, and the three were described as "mildly liberal . . . realists, not visionaries." All three had, however, supported much of the Roosevelt program.

Shortly after taking office on June 30 Clark announced plans for reorganizing the Justice Department and consolidation of some of its seven divisions, with contemplated annual savings of millions of dollars. One of the changes, announced several months later, was the assignment to the Federal Bureau of Investigation of all future investigations of antitrust cases, and of all criminal investigations to be undertaken by the Department. In the case of the antitrust suits, Clark indicated that bringing the FBI into the picture was not a move to produce more criminal indictments, although the Department intended to pursue a strong policy of antitrust enforcement during the reconversion period. Another plan announced by Clark was that of creating a new bureau on juvenile delinquency, headed by experts. In addition, he said that he would encourage Federal attorneys throughout the country to institute the "Brooklyn system," a method which has been used by Federal authorities in Brooklyn, New York, for several years. Under this system offenders under twenty-one are placed on probation before instead of after conviction. Their cases are investigated before they are brought to trial, and in many instances these persons are not prosecuted. Clark also recommended the establishment of youth centers to train young delinquents, these centers to be staffed by psychiatrists and other experts.

With the war not yet ended when he took office, the new Attorney General was faced with many pressing wartime problems. In July he was authorized by the President to order removal and repatriation of dangerous enemy aliens, and to this end he named a three-man board to hear cases of hundreds then in custody. He announced a coordinated campaign against black markets, to be prosecuted jointly by the Justice, Treasury, and Agriculture departments, and by the OPA. Cases of this sort and of tax evasion, he said, were to be heard first; with the coming of V-J Day he warned that the Justice Department did not propose to relax its vigilance.

After Japan's surrender the Attorney General's office was presented with new considerations—those of demobilization, the termination of war-derived authority, the protection of veterans' rights. In October Clark told reporters that the chief concern of the Department was then the prosecution of tax delinquents, while antitrust enforcement was the second big concern. Experience has shown, he told the Senate committee investigating the full employment bill, that the stifling of competition has "a pronounced effect on employment." It is the job of the Justice Department one commentator observed shortly after the end of the war, to see to it that during the reconversion period there is no promotion of monopoly while new enterprises are being formed and the Government is disposing of surplus war plants and other goods and properties. For his part, Clark emphasized in various speeches that it was not the intention of the Department to "make persecution out of prosecution."

One of the most complicated of the reconversion problems concerned the disposal of the fifty-two Government-owned aluminum plants, built during the war, in a manner that would insure fair competition in the industry. Involved in this was the question of the future of the Aluminum Company of America (Alcoa), declared a monopoly by the Federal courts in March 1945. In a report submittted to Congress in September, Clark recommended the reorganization and subdivision of Alcoa into a number of competing companies to bring about more efficiency, lower costs, and more jobs. This measure, the company claimed, would "destroy property values running into millions of dollars owned by thousands of small investors" and institutions, and prepare the way for Government subsidies.

The next month Congress was asked to "decide whether the Government should subsidize new producers of aluminum, both to carry out Clark's program for the dissolution into smaller companies of Alcoa and to fix a line of policy to be followed in the disposal" of the Government's seven-hundred-million-dollar plants. The difficulty of a solution lay partly in the fact that only Alcoa seemed to be in a position to buy and operate the plants without Government assistance. Another factor was that no peacetime consumer demand equaled that of the wartime aviation industry, with the result that large stockpiles of aluminum had piled up by the close of the war. Of the solution, the *Christian Science Monitor* wrote in October: "Whether it is measured in terms of dollars, of consequences on American industry, upon employment, or upon the pattern set between Government and private enterprise the issue now transcends any other reconversion problem that has come out of World War II." As put by W. Stuart Symington '45 of the Surplus Property Administration, Congress seemed to be faced with a choice between monopoly control of the aluminum industry by Alcoa and Federal subsidies, or Government interference in business, in the words of others.

Other monopoly cases with which Clark's Justice Department became concerned before the close of 1945 were those of the Permutit Company and of several companies engaged in manufacturing electrical goods. The Permutit Company was charged, with companies representing five foreign countries, of "dividing the world into six areas of operation with which each of the member companies would have the exclusive right to manufacture and sell the patented water-purifier equipment and process." The electrical companies, General Electric Company, Westinghouse Electric Corporation, two of their subsidiaries, and an export company controlled by them, were charged with having formed an international cartel in 1930 with leading German, British, and Swiss manufacturers.

Tom Clark is over six feet tall, dark, young-looking. He shows his Texas background by wearing a "ten-quart" Stetson hat, by colorful bow ties, of which he has scores, by his calm geniality, and by a soft Southern drawl. Clark is described as having graying hair, brown eyes, "a long nose with a slight bump to it, something of a double chin, a broad grin, and . . . a genius for making friends," particularly in Congress. A Mason (Scottish

Rite and Shriner), he belongs to clubs in Washington, Dallas, and Los Angeles. Before he became Attorney General he used to insist upon driving an ancient, dilapidated car. Now that he no longer has time for hunting and fishing, Clark depends on dieting and volleyball to keep his weight at one hundred seventy-five pounds; if he gets home before dark he plays ball with his son, and he likes to take young Mildred shopping. On Sunday mornings he cooks the household's hot cakes. He also claims a talent for frying chicken and concocting fruit salad; and he adds that he is "one of the greatest dishwashers in the country." Tom Clark's usual greeting to anyone he knows, a nice blend of Southern formality and Western breeziness, is "Hya doin', sir?"

LT. GEN. LUCIUS D. CLAY

CLAY, LUCIUS D(UBIGNON) Apr. 23, 1897- United States Army officer

Address: b. c/o War Department, Washington, D.C.; h. 3900 Connecticut Ave., Washington, D.C.

The first man to direct civil affairs in the American zone of occupation in defeated Germany is the Army's "tough-minded" administrative expert Lieutenant General Lucius D. Clay. When President Roosevelt '42 in March 1945 announced Clay's appointment as deputy to General Eisenhower '42, then commander of the Allied military government in Germany, he said: "The task of developing an organization for occupied Germany and administering it is one for which General Clay is particularly qualified by reason of his splendid service in the civilian as well as in the military branches of government." A top-ranking engineer, Clay also became a leading production and supply specialist after Pearl Harbor. When General Joseph T. McNarney '44 became Eisenhower's successor, Clay remained as his deputy military governor.

A distant kinsman of the statesman Henry Clay, Lucius DuBignon Clay was born in Marietta, Georgia, to Sarah (Francis) and Alexander Stephens Clay. His date of birth is April 23, 1897, the year his father, a prominent lawyer, was elected to the United States Senate. (Alexander Clay held his Senatorial seat until his death in 1910.) In preparation for a military career, young Lucius was sent to the United States Military Academy. Immediately after his graduation from West Point in 1918, when the United States was at war, he received his commission as a second lieutenant in the Corps of Engineers on June 12, and on the same day he was promoted to first lieutenant and to captain (temporary). Three months later the young officer was married to Marjorie McKeown.

Clay's first assignment was as instructor at the Officers' Training Camp at Camp Humphreys, Virginia. In December 1918 he was assigned to the Engineers' School at the same post, and a year and a half later, in June 1920, he was graduated from the civil engineering course. In February of that year he had received his captain's bars (permanent). The following year he served as a professor of military science and tactics at Alabama Polytechnic Institute in Auburn, then returned to Camp Humphreys in August 1921 as engineering officer and instructor in the Engineers' School.

After a year in this teaching post, and another year during which he was engaged in preparing the training regulations at the camp, Clay was assigned to West Point as an instructor (August 1924). At the end of four years he returned once more to Camp Humphreys. In the course of his tour of duty there, in July 1930, he was graduated from the course for company officers at the Engineers' School. He was then assigned to Corozal, Panama Canal Zone, for service with the Eleventh Engineers. In September 1931 Clay was transferred to the Office of the District Engineer at Pittsburgh. In this post he was in charge of the construction of Lock and Dam Number Two on the Allegheny River until 1933, when he reported to Washington for duty in the River and Harbor Section of the Office of the Chief of Engineers. In 1934 Clay represented the United States at the Per-

CLAY, LUCIUS D.—*Continued*

manent International Navigation Conference at Brussels.

Clay joined General Douglas MacArthur's '41 staff in the Philippines in October 1937. With headquarters in Manila, he served as adviser on engineering projects and the survey of water power facilities. His next assignment took him back to the United States, to Texas, where he was appointed district engineer at Denison in August 1938. There he supervised construction of the Red River dam for two years. Engineering combined with aviation was to occupy him next, for in October 1940 he became secretary of the Airport Approval Board and assistant to the administrator of civil aeronautics. For his work in this position Clay was given the Legion of Merit award in April 1945. The citation reads: "For exceptionally meritorious conduct in the performance of outstanding service while in charge of the civil airport program of the United States from October 1, 1940, to December 16, 1941. Working in close cooperation with the War, Navy, and Commerce departments, General Clay organized and directed a construction program which included improving and enlarging 277 airports and constructing 197 new ones in the continental United States, Alaska, and certain Pacific islands. General Clay displayed unusual judgment, foresight, and energy in establishing a national system of airports which has proved to be of tremendous value to the United States in the war effort."

In March 1942, a few months after the entry of the United States into the war, Clay became deputy chief of staff for requirements and resources in the Services of Supply (later redesignated as the Army Service Forces). The following July he was assigned to the headquarters of the Army Service Forces in Washington, D.C., as assistant chief of staff for matériel, a title later changed to director of matériel. (At this post, in December 1942, he was advanced to major general [temporary].) In his capacity as director, the General was largely responsible for the procurement program of the Army Service Forces. As right-hand man to General Brehon Somervell '42, commanding general of ASF, Clay dealt directly with top WBP officials and manufacturers. He studied the capacities and techniques of war plants, as well as their manpower and supply problems. The Army's hard-hitting matériel director "needled" manufacturers in filling contracts and contributed to the development of new weapons.

During this period Clay wrote a long and detailed article, "The Army Supply Program," which appeared in *Fortune* Magazine in February 1943. In this thorough survey the supply chief explained the Army's production policy and discussed the origin and operation of its supply program. This program, revised to meet wartime needs, was ready in February 1942. It was based on "the mobilization rate, and the composition of troops deemed desirable at that early stage of the war, and it included large quantities of matériel that our allies had ordered or requested the year before." Calling for sixty-two billion dollars, the program was gradually adjusted to changing requirements and supplies until the original cost was halved. Clay discussed various phases of production, including scheduling and the problem of schedule breakdown. In plain language, using technical, explanatory illustrations, Clay painted the complex picture of the Army supply program and its numerous dependent factors. Emphasizing that "the requirements for all-out war are insatiable," Clay declared, "Production must be controlled by the necessities of war; it should never dictate requirements."

In April 1944 Clay headed a board of five officers assigned to investigate Army operation of the Breakers Hotel in Palm Beach, Florida. The decision of the Army to abandon this luxurious resort as a hospital provoked considerable public controversy. In its report the board of Army officers submitted its unanimous recommendation to relinquish the project as an "impracticable and financially unsound" venture. A month later Clay testified before the House Military Affairs Committee on the subject of surplus materials. He informed the committee that the War Department did not want the job of disposing of such supplies but rather believed that this task should be taken over by some outside agency. However, Clay pointed out that the War Department did want authority to determine what should be labeled surplus after the war and to select supplies to be held for national defense. He also added that some war plants must be held as "stand-by" equipment for five years or more after the war, certainly until it was known what the future military picture was likely to be. War plants recommended for prompt sale were those producing explosives and other types of manufacturing units whose rate of obsolescence of equipment and product is high. He also included those war plants equipped to serve civilian needs.

In August 1944 Clay appeared as a witness before the Senate War Investigating Committee, which considered production problems. He blamed the failure to reach certain production goals on manpower shortages, fatigue, and optimistic war news, which had the effect of "dulling the sense of urgency." Clay emphasized, however, that the general production picture was "magnificent." That same month *In Fact* reported a special press conference held by General Clay at which he denied an antilabor charge spread by press and radio. The supply director declared: "There has never been a case, so far as we have heard, where our men lacked ammunition due to any strike or other lag in production." Also in August, when the shortage of heavy-duty truck and bus tires became acute, Clay offered to the WPB the Army's plan to increase the output of these supplies. He outlined a furlough program for soldiers formerly engaged in the tire industry, providing leaves for such men over thirty stationed in the United States, and not in the infantry. In the fall of 1944, when there was trouble with supply lines after the Allied capture of Cherbourg, Clay, the Army's "prize troubleshooter," was sent to that French port. So successful was he in handling the difficulties in the wrecked city that one writer stated that in one day Clay "doubled the supplies shipped to the front, quintupled them before he left."

In December, when the Nazi offensive brought intensified production, the director of the Office of War Mobilization and Reconversion James Byrnes '41 requested Clay's assignment to his staff. Released temporarily by the Army from military service, Clay joined Byrnes as deputy director for war programs and general administration, retaining his uniform and rank. His primary responsibility was to coordinate the programs of all agencies concerned with war production and to "expedite the delivery of supplies from the assembly lines to the front lines." For the brief span of four months the General served as assistant to Byrnes, establishing a reputation for severe home-front policies. Some civilian officials resented Clay's tough "military-first" point of view, and it is reported that the OWMR advisory board desired the officer's dismissal.

But Clay's determined attitude remained unchanged; he was called "perhaps the most influential voice" in the Government's stern home-front policies. It is believed that he was responsible for many of the controversial "crack-down" measures, such as the racing ban, the ban on display lighting, and the curfew, reportedly adopted for their psychological effect on the home front. Acting as "buffer between the brass hats and the war agencies," Clay supported Byrnes's war measures and incurred the wrath of business-as-usual individuals. In the critical manpower situation he endorsed the May '41-Bailey '45 bill for limited national service. He opposed reconversion experiments before V-E Day, insisting that the "need and demand for military supplies will be at their peak on the date the Germans quit." Throughout his activity in the OWMR Clay maintained that the important job was to supply the fighting forces—he was called the "conscience" of the home front.

Following his assignment as deputy to General Eisenhower, Clay went overseas in April 1945. (That same month President Truman '45 nominated Clay for promotion to lieutenant general, and the Senate later confirmed the nomination.) Knowing Clay's capabilities, Eisenhower had requested this assignment for his friend. (General Joseph T. McNarney succeeded Eisenhower late in 1945.) According to plan, following the surrender of Germany the administration of the country was placed under the direction of the Allied Group Control Council—later the Allied Control Council (France, Great Britain, the Soviet Union, and the United States); the policy the Council would follow was indicated by the Potsdam agreement. As deputy military governor, Clay was given the direction of civil affairs in the American zone of occupation in southern Germany. Clay was reported to be sensitively aware of the public relations part of his job, and of keeping the support of the American people while he dealt with the problems of German economy. A writer for *Look*'s Washington bureau, in describing Clay's job of "driving an American twelve-horse team and keeping it in step with three similar teams," stated, "The horses of the team are the twelve divisions of the United States occupation government: ground army; naval; air; transport; political; economic; finance; reparation, deliveries and restitution; internal affairs and communications; legal; prisoners of war and displaced persons; and manpower."

The press welcomed Clay's appointment to this formidable job, calling him a strong believer in duty and principle. The appointment was consequently interpreted as a sign of stiffening AMG policy in Europe. The New York *Herald Tribune* editorially expressed its approval of the choice of Clay for the post: "Apart from his excellent personal qualifications, however, it is satisfying to know that an Army man has been selected for what is essentially an Army job. The occupation of Germany, quite possibly for some years to come, will mean extirpating the last vestiges of Nazism, of policing an anarchic state and providing direct control over German economy and public services." Analyzing Clay's past record as a severe administrator, most commentators agreed that "life will be hard for the German citizen, but things may be a little easier for the American." It was also pointed out that Clay does not belong to that group of persons who sympathize with the German people, as distinguished from their leaders. The *United States News* ventured the opinion that "the German civilian can expect a minimum of the things that make life more comfortable. But he can expect that as quickly as possible the debris of war will be cleared away and civil affairs set to moving on the basis of a solid organization."

Clay's first public statements on the planned military government of the Reich reassured those who had feared a policy of leniency might be adopted toward the conquered Germans. In an interview on May 17 the General outlined plans for Germany. He emphasized that the people would have a military government whose main purpose will be to de-Nazify the territory and restore the democratic processes. There was a fundamental split in the Allied Control Council, wrote Raymond Daniell '44 in September, between those who wished to continue the Anglo-Russian-American alliance and those who wished to preserve "a vestige of German industrial and military strength to defend Western civilization at the Elbe." This conflict, Daniell claimed, would come to a showdown on the issue of whether "reparations or the German standard of living was to be the primary consideration."

The question of how much industry Germany should be allowed to retain was answered from the American zone by General Clay, who stated, as Eisenhower did, that the Potsdam directives controlled American policy. His Government, he declared, interpreted these directives as "calling for the establishment in Germany of a standard of living equal to, but not above, that of surrounding countries." From American observers in Germany came the report, however, that the American Military Control Council under Clay was not carrying out the policy to eliminate Germany's power to make war. And the *Stars and Stripes* in December quoted a high-ranking officer to the effect that the American military government faced "complete collapse." Specialists of all kinds were desperately needed, he revealed; while William L. Shirer '41 indicated that hasty redeployment was responsible for an attitude of indifference.

Until General George Patton '43 was relieved of control of Bavaria after charges of laxness in removing Nazi officials from office, similar criticism was directed at other American of-

CLAY, LUCIUS D.—*Continued*

ficers. In response, Eisenhower had stated in October that Nazis were to be deprived of a vote in Germany, that the Army would "uproot Nazism in every shape and form." Several other positive steps could be seen by the end of 1945. Clay announced in October that the Allies had seized the three hundred German plants of I.G. Farbenindustrie. Of these, the war plants would be destroyed; the others would be dismantled and turned over to the Allies as reparations. (This issue of reparations was one on which the Russians had accused the British and Americans of being dilatory.)

In October the Allied Control Council formally proclaimed "the abolition of the National Socialist Party and the Nazi bureaus and subdivisions which had directed every phase of German life." Clay then announced that United States military government teams would be withdrawn from the administration of small towns and rural counties the next month, with transfer of this lower-level administration to non-Nazi Germans. By February 1, 1946, the General revealed, the first move would be made to increase this to state level, but American officers would be retained in a supervisory capacity, he added. (He has expressed the opinion that the Allies must remain in Germany for at least a generation.) At the end of the year he reported that German prisoners of war were being trained as administrators, policemen, and leaders of democracy. In explaining these moves, strongly criticized as premature, Clay said, "We are pulling out of a job that can best be left to the Germans. We believe we can better hold them responsible for administration if we give them a freer hand. In this way the German people will know that their own organs are responsible for the successes and failures of administration."

The food problem, another knotty question, was pointed up by Clay's statement in November that there was no food "in any substantial amounts" in Europe, and the request from the American zone for three hundred thousand tons of food to supply civilians in the area. The next month he assured the Council of State Minister Presidents (the chiefs of the German Government in each of the provinces in the American zone who "oversee and coordinate intrazone communications, trade, and finance), that the United States would not let the people starve, that food would be sent to them. The expenses, he explained, would be met when Germany was able to pay.

Clay's ninety-five-thousand-word official report on conditions in the American zone, issued at the end of the year, gave a gloomy picture. There was unrest and lawlessness among adult Germans, he pointed out, chiefly among displaced persons; and, although primary schools were slowly opening, teachers were scarce and juvenile unruliness was another problem. Without question, the Germans faced a cold, hungry winter, he said, for the scarcity of necessities, of adequate shelter and transportation was becoming serious. Even such advancements as the return of religious freedom and an uncensored press were hampered by the difficult circumstances.

Throughout all the months of the Allied occupation it was becoming more and more obvious that the United States Army was anxious to turn over the control of Germany to civilians as quickly as possible. The problems caused by redeployment of Army personnel, and the feeling that the military are not properly prepared by training and experience for civil government were offered as reasons for a speedy transfer of duties. Finally, in November, while in Washington for discussions with the War Department, Clay disclosed that it appeared likely that this transfer would proceed rapidly during the early months of 1946. (Already such replacement had begun.)

From the beginning of the Allied occupation strong criticism was directed against the military government for its progress in de-Nazifying and deindustrializing Germany. The Allied Control Council itself by the end of 1945 had not determined on a unified program. The French, Clay reported on a visit to Washington in November, were opposed to any unification of Germany which might strengthen it industrially, and this stand, which hindered rehabilitation, was in opposition to Potsdam directives.

Blunt, tough, and thoroughly an Army man, General Clay is a trim military figure. He has coal-black hair, bushy brows, and a voice described as a "deceptively soft baritone." In April 1945 Clay received the Distinguished Service Medal for "exceptionally meritorious and distinguished service . . . as director of matériel." In September he was awarded the Russian Order of Kutuzoff, First Class for this same service and also for his work in demilitarizing Germany.

General Clay belongs to the American Society of Civil Engineers and the Society of American Military Engineers. He also is a member of the Permanent International Navigation Congress, while his clubs are the Army and Navy, and the Army and Navy Country Club. When Clay received his new assignment as director of German civil affairs he was frankly pleased, glad to leave his Washington desk for duties overseas. The General's two sons, Lucius Dubignon and Frenck Butner, were in Europe during the war, one in the Air Force and the other in a tank outfit.

COLBERT, CLAUDETTE (kôl-bâr) Sept. 13, 1905- Actress

Address: h. Holmby Hills, Los Angeles, Calif.

One of Hollywood's most important box office attractions in the past decade, Claudette Colbert has won recognition for her portrayal of three types of characterizations—undiluted sex appeal (*Cleopatra*), light comedy (*It Happened One Night*), and mature drama (*Since You Went Away*). Born Claudette Chauchion in Paris on September 13, 1905, in 1910 she was brought to New York with her brother Charles by her parents, Georges and Jeanne (Loew) Chauchion. Lily, as she was nicknamed by her father, attended Washington Irving High School, where she studied art and designing with the hope of becoming a great fashion designer. Upon her graduation in 1923 she went to work as a general "handy" girl in a gown shop in order to learn more about designing. She supplemented her thin pay envelope by giving French lessons in the evenings.

But whatever ambitions she had in the field of dress designing evaporated when Anne Morrison, the playwright, not only suggested that she become an actress, but found her a three-line part in *The Wild Westcotts* (1923). Once Claudette Chauchion walked on the stage, she knew that she never wanted to do anything but act. (It was at this time that she changed her name to Colbert.)

After the tryout performance in Stamford, Connecticut, where the neophyte actress trod the boards in company with Cornelia Otis Skinner['42], Elliot Nugent['44], and Edna May Oliver, Miss Colbert's part was expanded. But the play soon closed, and then began the succession of small parts, short-lived engagements, and discouraging road tours, the school of most successful players. *We've Got To Have Money* (1923), *The Marionette Man* (1924), which closed in Washington, *The Cat Came Back* (1924), *High Stakes* (1924), and *Leah Kleschna* (1924) followed in quick order. Her luck turned when she appeared in the farcical comedy *A Kiss in a Taxi*, which ran for all of 103 performances. That opus (as well as several others of her earlier plays) was produced by Al Woods.

Then came the mysterious *Ghost Train* (1926), and the allegorical *The Pearl of Great Price* (1926), a spectacular production which died after thirty-two performances. Miss Colbert's first good opportunity to display her talent came in the role of Lou, the snake charmer, in Kenyon Nicholson's *The Barker* (1927). In that role, too, her nice legs attracted attention, and this led to her first part before the camera, playing opposite Ben Lyon in the silent film *Love O' Mike*, which was filmed during the 172-run performance of *The Barker*. Starring with her in *The Barker* were Walter Huston, and Norman Foster, to whom she was married in 1928. (The Fosters were divorced in 1934.) *Love O' Mike* proved a failure for her, however. "I'll never make another motion picture," she declared, and subsequently she graced Broadway's *Fast Life* (1928), *Tin Pan Alley* (1928), Eugene O'Neill's *Dynamo* (1928), which critics deemed the only bad play O'Neill ever wrote, and Elmer Rice's['42] *See Naples and Die* (1929).

CLAUDETTE COLBERT

Then Miss Colbert accepted a tempting offer from Paramount's New York studios. She made her "talkie" debut as the harassed heroine trying to elude Edward G. Robinson in the mystery thriller, *A Hole in the Wall* (1929). Paramount next cast her in *The Lady Lies* (1929), in which she was an instant hit. In 1930 Miss Colbert appeared in *The Big Pond* (with Maurice Chevalier), *Young Man of Manhattan*, and *Manslaughter*, for which she was dispatched to Hollywood. With the exception of the *Smiling Lieutenant* (1931), Miss Colbert's succeeding movies were a series of trivial pictures—*Secrets of a Secretary, Honor Among Lovers*, and *His Woman*, in 1931; and *The Wiser Sex*, *Misleading Lady*, and the *Man From Yesterday*, in 1932—in which she portrayed sweet, clinging, virtuous women. Finally, she boldly demanded the role of Poppaea, "the wickedest woman in the world," in DeMille's['42] *The Sign of the Cross* (1932), which depicted the persecution of Christians under Nero.

While Miss Colbert was now undisputably a star, until the revelation of her flair for comedy she was seen only in a string of comparatively undistinguished photoplays: *The Phantom President* (1932), *Tonight Is Ours* (1932), *I Cover the Waterfront* (1933), and *Three-Cornered Moon* (1933). Then Paramount loaned Miss Colbert to Columbia Pictures to play opposite Clark Gable['45] in *It Happened One Night* (1934), a highly diverting, lively comedy, skillfully directed, which concerned the adventures of a runaway heiress and a romantic newspaperman journeying by bus from Miami to New York. It was released by the studio with little fanfare, and immediately won for its director, Frank Capra, and the players a handsome collection of "Oscars." Now a veritable classic, it is still frequently revived.

Directly after her sensational success in *It Happened One Night*, she surprised her friends by accepting the *Imitation of Life* (1934) role, making her the mother of a grown daughter, in order to be able to do the same thing years later without being typed as a mother.

COLBERT, CLAUDETTE—*Continued*

It was she who chose the unknown Fred MacMurray to act with her in *The Gilded Lily* (1935), which made him a star. (Miss Colbert has made a practice of appearing in only two pictures a year, for which she is paid $150,000 each, and she regularly heads the list of high-salaried movie players, although her earnings are less than those of several actors who also have radio, recording, or other contracts.)

The actress was also to appear in a variety of films, ranging in mood from the allure of *Cleopatra* (1934) and the stark drama of *Private Worlds* (1935), to the expert comic artistry of *She Married Her Boss* (1935), *Tovarich* (1937), *I Met Him in Paris* (1937), *It's a Wonderful World* (1939), and *Midnight* (1939). Lesser successes included *Under Two Flags* (1936), a tale of life and love in the French Foreign Legion, the historical *Maid of Salem* (1937) and *Drums Along the Mohawk* (1939); *Bluebeard's Eighth Wife* (1938). *Zaza* (1939), the story of a French can-can dancer, was her one real failure.

In 1940, after the failure of *Boom Town*, a cavalcade of the oil industry which critics considered more as a parade of stars—Miss Colbert, Clark Gable, Spencer Tracy '43, and Hedy Lamarr—than a good play, the actress went back to the business of light comedy in *Arise My Love*. Set against the background of current events in Europe, this was a series of romantic scenes between a beauteous American reporter and an American aviator (Ray Milland) whom the girl has saved from a Spanish death sentence by pretending to be his wife. This was followed by *Skylark* (1941), with its slight plot about divorce; *Remember the Day* (1941), a sweetly nostalgic picture in which Miss Colbert appealingly portrayed a small-town, definitely gray-haired schoolteacher; and *Palm Beach Story* (1942), a wild slapstick farce written and directed by Preston Sturges '41.

In *No Time for Love* (1943) Miss Colbert, as a high-priced photographer, ventured deep into the mud usually braved only by the sandhogs who build tunnels under rivers. Next she relegated to the background her sartorial elegance and glamour as one of the exhausted young nurses wearing GI brogans and coveralls in *So Proudly We Hail* (1943), called an arresting, sincere war film, a tribute to the gallantry of Army nurses on Bataan.

For *Since You Went Away* (1944) Miss Colbert, giving perhaps the most notable performance of her career, became Anne Hilton, the successful wife and mother who upholds "that fortress—the American Home"—meanwhile graying perceptibly and learning to be a welder. While David O. Selznick's '41 first production since *Gone With the Wind* (1939) and *Rebecca* (1940) was considered a human document of the Second World War, charged with atmosphere and Americana, many critics felt that the two hours and fifty-one minutes running time of the film was marked by too many repetitive climaxes and too many heart-tugging sequences. After playing the mother of Jennifer Jones '44 and Shirley Temple '45 in Selznick '40-International's *Since You Went Away*, Miss Colbert went back to a young role opposite Fred MacMurray in *Practically Yours*, and was "admirably naïve, simple, and charming" in that lively comedy. Next came a less successful comedy, United Artists' *Guest Wife*, and then another mother role in the emotional drama *Tomorrow Is Forever*, opposite Orson Welles '41, in which she chose the co-star as well as her role. She was also reported to have signed with Sam Wood '45 of Columbia Pictures for *Jubal Troop*, having terminated her fourteen-year contract with Paramount in 1944.

A brown-eyed brunette who wears her reddish-brown hair in bangs, Claudette Colbert is five feet four and one-half inches tall and weighs one hundred and eight pounds. She is known in the film capital as the actress who will not present the right side of her face to the camera, because, she claims, that profile does not photograph well. When this preference was forgotten once by a director who had approved the construction of a set which necessitated the actress' entering a room with the right side of her face toward the audience, the set was dismantled and rebuilt.

At no time in her career, however, has the chic Miss Colbert relied upon beauty and physical appeal alone. These attributes are fortunate to possess, she believes, but a good story and a competent and showmanship-wise director are more important for a star. She has proved her theory that getting to the top does not depend upon having "connections" or a flashy "act," and that the so-called "breaks" are not mere accidents but the result of careful planning and knowing how to take advantage of opportunities. She is said to be friendly, completely untemperamental, and popular with cast and crew. She likes to dance and listens frequently to orchestral music, especially that of Tchaikovsky and Sibelius.

Miss Colbert and her husband, Joel Pressman, who is a physician and surgeon, live in a spacious house built at the time she achieved stardom. Working closely with the architects and builders, and concentrating on every detail, the actress spent weeks in New York shopping for incidental chairs, silver, lamps, and the original Manet which hangs over the drawing room fireplace. She says that one of the most important objects in the house, pinned over a mirror in the upstairs sitting room, is a little Silver Sun hanging from a pair of skis. Miss Colbert won the trophy at Sun Valley in the winter of 1939. She is proud of it because to get it a woman must cover the course in two minutes, fifteen seconds. Miss Colbert made it in one minute, forty-seven seconds.

COMDEN, BETTY May 3, 1918- Playwright; actress

Address: h. 47 W. 68th St., New York City

GREEN, ADOLPH Dec. 2, 1918- Playwright; actor

Address: h. 240 Central Park South, New York City

"The theater is *jammed* with young talent," protests Adolph Green, in answer to Billy Rose's '40 contention that there is no scarcer commodity. And *On the Town* (1944), the musical ballet-comedy of which Green and Betty Comden are co-authors, is an even more effective answer. George Abbott '40, who directed the show, was the only person involved in its creation who is on the wrong side of thirty: Leonard Bernstein '44 (composer), Jerome Robbins (choregrapher), Paul Feigay (producer), and Oliver Smith (stage sets, co-producer) are the other young talent responsible. On Broadway, *On the Town* has made theater history in at least two other respects: it is the first musical ever bought by Hollywood in a pre-production deal, and it is the first in which its authors are also actors.

The story of *On the Town*—"the daffiest musical comedy plot in years"—involves three sailors on a twenty-four-hour leave in Manhattan who are smitten by a picture of "Miss Turnstiles" on the subway and promptly set out to find her. The search takes them to Carnegie Hall, Central Park, Times Square, three quite identifiable night clubs, and Coney Island, all of which come in for their share of cheerful kidding in song, dance, and dialogue. It might be gathered that both of the young author-actors are New Yorkers—and they are. It might be added that they are fanatical New Yorkers, with no intention of ever becoming anything else.

Betty Comden is a product of Brooklyn, where she was born on May 3, 1918, the daughter of Leo and Rebecca (Sadvoransky) Comden. Her father was a lawyer, her mother a schoolteacher, and her brother (overseas in 1945) is a doctor. So far as she knows there were no writers or actors among her more distant ancestors either, but she has been writing and acting ever since she attended Brooklyn Ethical Culture School, where the students read books like Scott's *Ivanhoe* and dramatized them. And Betty continued to write while in Erasmus Hall High School, but by this time, having acquired the discouraging notion that an actress had to be "very beautiful," she spent her other creative moments at the Clay Club in Greenwich Village instead of trying out for high school plays. By the time she matriculated at New York University she had decided to major in dramatics, however.

BETTY COMDEN

Major in dramatics she did, with the idea of teaching it later. But teaching must have been an extremely half-hearted ambition. Guided by her unschoolteacherish subconscious, she never took quite enough teaching courses to get her license; and when she received her B.S. degree in 1938 she began patiently making the rounds of theatrical agents—with no luck at all. It was during that period that she met Adolph Green, who was doing exactly the same thing with exactly the same results.

Her collaborator-to-be was born in another New York City borough, the Bronx; the date was December 2, 1918, the parents Daniel and Helen (Weiss) Green. Adolph had written poetry and acted in school plays in grammar school and at camp, but his actual dramatic experience was even less impressive than Betty's at this point. Graduated from Clinton High School in 1934, he found Wall Street more eager to employ his talents than Broadway, and accepted a job as a Wall Street runner. By the time he met Miss Comden he had been "vaguely looking" for work as an actor for four unexciting but athletic years.

There were plenty of other young people in the same predicament in those semi-depression days. One of them, Judy Tuvin, knew the owner of the Village Vanguard, at that time the last stronghold of old Village bohemianism; he told her that he would like to put on some kind of a show there that would employ young talent. Judy Tuvin brought Adolph Green down to the Vanguard; Adolph Green promptly brought in Betty Comden and Alvin Hammer; Betty Comden introduced John Frank. The Revuers were being born, even if they didn't know it yet. It was only after the

ADOLPH GREEN

five of them had been putting on separate acts for a while that the idea came to them of doing a satirical show together. Fortunately all of them not only sang, danced, and acted, but were endowed with ingenuity and imagination—necessary qualities for a group of performers who had to write their own lyrics, music, and dialogue as well as provide their own backdrops and costumes. The Revuers' light-hearted kidding of advertising, journalism, American magazines, and Hollywood attracted all sorts of important theatrical people to the Vanguard, and from putting on one show every Sunday night they were soon playing three nights a week, then six. The Vanguard was rapidly becoming a popular night club, too: the owner was encouraged to install a telephone and to get a liquor license.

In everything but a financial sense The Revuers were already a success—and even twenty-two dollars a week apiece was some improvement over their original five dollars—but in September 1939 the mercenary five forsook the Vanguard for the Rainbow Room in Rockefeller Center. After a two months' engagement there they were invited to put on a weekly program over NBC—a program on which Dinah Shore '42 and the Basin Street boys also appeared. Engagements at Radio City's Music Hall, at Loew's State, at Spivy's, at Cafe Society (both Downtown and Uptown), and several television shows followed. It was while playing an engagement at the Blue Angel that they got their first movie offer—to play in *Duffy's Tavern*. That particular deal fell through, but in Hollywood they worked at the Trocadero until assigned by Twentieth Century-Fox to appear in *Greenwich Village* (1944).

The brief glimpse of The Revuers in *Greenwich Village* hardly made movie history. Only Miss Comden and Green returned to New York, however. Judy Tuvin (now Judy Holliday) and Alvin Hammer had succumbed to the lures of Hollywood; John Frank had dropped out of the group some time before, to go into defense work. The twosome that remained ended by accepting another engagement at the Blue Angel, and their satire did not seem to suffer from a depletion of their ranks. Then, one spring night, their friend Leonard Bernstein wandered in, with Paul Feigay and Oliver Smith in tow. The three young men asked the two remaining Revuers if they would be interested in doing the book and lyrics for a full-length show built around the idea of *Fancy Free*, the highly successful ballet by Bernstein and Jerome Robbins. There was no doubt that they would.

Soon, too, there was no doubt about what they wanted the show to be. In the first place, they wanted to make their characters three-dimensional—particularly the three young sailors, with their feeling of having to crowd everything into twenty-four hours. They wanted to capture the sailors' feeling about a big, strange city, too—not just any city, but New York, which is not quite like any other place in the world. They wanted everything in the show to be there for a reason, with no gags simply for gags' sake. Most of all, they wanted the music and the ballet to spring naturally from the story. "Integration" was the word they kept using while they worked.

The story, the character development, and the various numbers in *On the Town* were all Miss Comden's and Green's ideas, but neither of them is sure of who invented what—Miss Turnstiles, for example. Their collaborative technique was what it always has been—a matter of sitting down and talking, and writing down in longhand whatever came out of the interchange. As for the show's lyrics, some of them were written before Leonard Bernstein had composed the music for them; the music already existed for the ballads. It all sounded pretty hit-and-miss, but even before the book was in final shape RKO had seen the show's possibilities and had agreed to invest $31,500 in it on condition that it be the only film company involved. Then, before the first rehearsal, Metro-Goldwyn-Mayer offered to buy the film rights for $100,000 in cash, plus a percentage of the gross for another $150,000, plus an investment of $62,500 in the stage production. The president of RKO waived his company's condition, not wanting to hold up the deal—and that was how *On the Town* became the first musical comedy ever bought by Hollywood before it reached the boards. When *On the Town* opened in Boston late in December 1944 to almost unanimous "rave" notices, the reason for Hollywood's interest became obvious. The Boston *Post* critic predicted that the show would "probably do for New York what *Oklahoma!* did for that state in the wild West"; and the New York opening later that month found it doing something similar for the Adelphi box office, at least.

Not every New York critic "went completely overboard" for the show, but those who did went very far over. *PM*'s Louis Kronenberger '44 pronounced *On the Town* not only "much the best musical of the year," but "one of the freshest, gayest, liveliest musicals I have ever seen." Lewis Nichols of the New York *Times* called it "the freshest and most engaging musical show since the golden days of *Oklahoma!* Everything about it is right . . . a perfect example of what a well-knit fusion of the respectable arts can provide for the theater." Ward Morehouse of the New York *Sun* ransacked his vocabulary of adjectives and came up with "brisk and festive," among others. E. C. Sherburne of the *Christian Science Monitor* described *On the Town* as "theatrical caviar, lifting caricature . . . one notch higher into a vein close to the ballet, which is nearer abstraction in entertainment than anything else now on the boards." The *New Yorker*'s Wollcott Gibbs found the whole affair so unlabored and effortless as to seem almost an improvisation. In *Variety*, however, these words appeared: "Not all the players are professional, and some appear to be semi-pros, if not amateurs. Not a real laugh was delivered at the debut and vocally the show is mediocre." The same reviewer pronounced the night club interlude "distinctly unfunny." Burton Rascoe did not go this far, but found *On the Town* only "pretty good fun," for those who are not "too exacting"; and the New York *Post* seemed to be somewhat reluctantly amused.

Those who didn't like the book were also in the minority. Here was "the best musical comedy book since *Pal Joey*," said Louis Kronenberger; Lewis Nichols found the book "coherent for a change," differing from most in that it speeded the action along instead of stopping it dead; the *Christian Science Monitor*'s critic also singled the book out for special compliments. But the New York *Herald Tribune*'s Howard Barnes decided that George Abbott's "shrewd direction" had made much of "scant material," while Wilella Waldorf talked in the New York *Post* of "proceedings" which "run all the way from slightly satiric tidbits to something approaching children's charades."

The parts that Betty Comden and Adolph Green wrote for themselves in *On the Town* are by no means the leading parts; if anyone could be called the star in a musical without starring roles it is Sono Osato '45, "Miss Turnstiles," who proves herself as ingratiating a comedian as she is a dancer. The sailor who finally acquires Miss Turnstiles and the predatory female taxi driver whose prey is the second sailor are almost equally fat parts. But Burton Rascoe has picked out as one of the high spots of the season's stage productions the scene in which Betty Comden (the lady anthropologist) pronounces Adolph Green (the third sailor, lost in the Museum of Natural History) "a rare specimen of the dolichocephalic skull." *Cue* says of Miss Comden that she "will remind you faintly, faintly of a young Fannie Brice," while Green "has that great showman quality, that indefinable cockiness that distinguishes a Joe E. Lewis or a Bob Hope '41 or even an Al Jolson '40 . . . which defies description, but is inherent in the way these men walk, talk, use their hands."

In the summer of 1945 the Comden-Green team, on leave from *On the Town*, wrote the book and lyrics for *Billion Dollar Baby*, for which Morton Gould '45 supplied the music and George Abbott '40 the directing. Smith and Feigay opened the production before the end of the year.

In private life dark-haired, attractive Betty Comden is part of another team: she was married on January 4, 1942, to Siegfried Schutzman, an artist who in 1945 is a sergeant in the Engineers, on detached service in connection with the Information and Educational Division. He was stationed in New York just in time for the opening of *On the Town*, which made everything "perfect." Mrs. Schutzman pronounces herself "just so happily married that there's nothing very colorful about my social life." She cooks, keeps house in a quite unpalatial apartment on West Sixty-eighth Street, owns no pets, and has no special eccentricities except a hatred of shopping (combined with a love for pretty clothes) and an equally violent distaste for being kept waiting. (She cannot cure herself of promptness.) Although she isn't on a diet she never eats chocolate; she didn't smoke even before the cigarette shortage; and she is no kind of parlor entertainer at all, if shows at the Stage Door Canteen and at veterans' hospitals can be excepted. As a member of the Independent Citizens Committee of the Arts, Sciences, and Professions, she makes sending telegrams to Congressmen one of her hobbies.

Adolph Green is unmarried, and interested in nearly everything—particularly the arts. Music is his special love—he whistles, can sing symphonic and rather unknown orchestral works from beginning to end and sound like a whole orchestra. Some day he would like to be a composer and conductor of symphonic music like his friend Leonard Bernstein. He also has a phenomenal memory, and as a student of the motion picture from way back amazes and sometimes annoys his friends by his ability to name the casts of every movie ever made. His chief dislikes, he says, are another Adolph —and "chi-chi."

CRABTREE, JAMES W(ILLIAM) Apr. 18, 1864—June 9, 1945 American educator; secretary emeritus of National Education Association since 1935; served as secretary to N.E.A. from 1917 to 1935, during which period membership grew from 10,000 to more than 200,000; secretary of former President Hoover's '43 Advisory Commitee on Education (1931-32) and World Federation of Education Associations (1935-38).

CRAWFORD, CHERYL (chĕr'ĭl) Sept. 24, 1902- Producer

Address: b. 49 W. 45th St., New York City

"If you want to produce [plays]," says Cheryl Crawford, "you must go after playwrights, give them some of your ideas, work with them on their own." Then comes editing, changing, rewriting—and getting the author to accept necessary changes. "I've never seen a play that could be put into rehearsal from the original script, except something by Eugene O'Neill," she explains. The producer engages and supervises the director, designers, cast, and other workers, makes all the business arrangements, decides on billing, attends to the hundreds of incidental details, finds the financial backing—and pays the bills. Not many women have succeeded as producers, but Cheryl Crawford, Manhattan's one active woman producer, has presented such hits as the memorable revival of *Porgy and Bess*, the gay *One Touch of Venus*, and the record-breaking Margaret Webster '40 production of *The Tempest*. In association with Miss Webster and Eva Le Gallienne '42, Miss Crawford is also business director of the projected American Repertory Theatre, to open in September 1946.

Cheryl Crawford was born in Akron, Ohio, on September 24, 1902. Her father, Robert K. Crawford, was in the real estate business; her mother was the former Luella Elizabeth Parker. Miss Crawford's early ambition, not encouraged by her three brothers, was to be a missionary; but she became interested in the theater at fifteen, when she played Lady Macbeth in an amateur production. At Smith College, which she entered after a year at Buchtel College, her interest grew into an ambition on contact with Professor Samuel Eliot's drama courses. There Miss Crawford wrote a long play for which her professor gave her an "A," and two short ones which were produced at the college. ("They were rotten," she says now.) Cheryl Crawford is said to have been the first undergraduate to produce financially successful plays at Smith—Kyle Crichton describes them as "toga-mad tragedies"—and during junior vacation she built scenery and did some directing in Frank Shay's Provincetown company.

Miss Crawford was graduated with the B.A., *cum laude,* in 1925. Then, according to *Cue,* she "squeezed into the Theatre Guild's newly formed drama school." After a year of trying, not too successfully, to support herself in New York, she got a job with the Guild. *Theatre Arts* says that she began in a secretarial job, while other sources say she was engaged as third assistant stage manager. At any rate, in the fall of 1926 she was an assistant stage manager for the Guild production of *Juarez and Maximilian,* the cast of which included Alfred Lunt '41, Margalo Gillmore, and Edward G. Robinson, and she also understudied Helen Westley. From 1927 on Miss Crawford shared in the Guild production of Dorothy and Du Bose Heyward's *Porgy* in New York, accompanied it on tour, and "played guardian to the company when it took the production to London," where it opened in April 1929. By 1930 twenty-seven-year-old Cheryl Crawford was casting director of the Theatre Guild, with the title of assistant to the Board of Managers. She was drawing a salary reported as $10,000 a year, and a place was being made for her on the Board.

The Theatre Guild was at the peak of its activity during these years. From 1926 to 1928 it produced fourteen hits in a row, a record never equaled by any other organization. But Cheryl Crawford felt, like many other younger members, that a permanent acting company should be established. Led by play-reader Harold Clurman, this group planned a noncommercial, experimental acting company. Miss Crawford obtained from the Guild Board their option on Paul Green's *The House of Connelly,* borrowed the services of young Franchot Tone '40 and Morris Carnovsky, and was given one thousand dollars toward production expenses. The group of about thirty actors, headed by the three directors (Crawford, Clurman, and Lee Strasberg), then spent the summer of 1931 as a sort of theatrical training camp, rehearsing *The House of Connelly.* At the end, the Theatre Guild agreed to put up half the production cost, Miss Crawford helped raise the remainder, and the play was presented. Notices were excellent and the backers broke even.

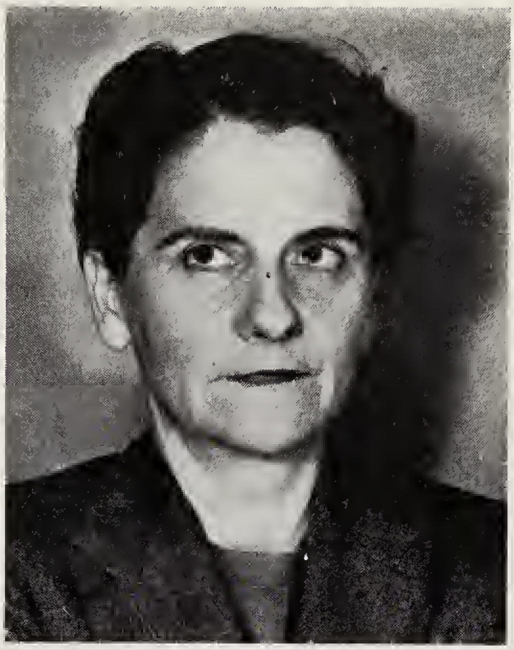
In early 1932 Miss Crawford and Harold Clurman resigned their Guild positions to become full-time directors, with Lee Strasberg, of the incorporated Group Theatre. They paid themselves fifty dollars a week, plus five hundred dollars apiece for each production (regardless of who actually directed it), thereby putting themselves in the middle pay bracket of the group. Established players like Tone, Carnovsky, and Luther and Stella Adler received several times that salary; but all the members were on regular salary, regardless of whether or not they were actually working on a current production, and regardless of the size of their current parts. There was a strong group feeling and an emotional intensity among the members which gave rise to a number of amusing stories, especially with regard to the "Stanislavsky system" which they employed in preparing roles. Cheryl Crawford devoted herself to what the others called "dirty jobs"—mainly raising money and shaping scripts into playable form; however, of *1931—*, Clurman quotes her in *The Fervent Years* as saying, "It is our theater's duty to produce such a play." The Group Theatre "supplied the New York stage in the 1930's with much of its vigor and excitement": it developed Clifford Odets '41, introduced William Saroyan '40 to the theater (with *My Heart's in the Highlands*), presented a number of important experimental plays, added luster to Tone, Carnovsky, and the Adlers, and trained many noted actors and directors, among them John Garfield, Elia Kazan, Robert Lewis, Roman Bohnen, Lee Cobb, Sanford Meisner, J. Edward Bromberg, and Alexander Kirkland. It actually had to suspend operations in 1933—and came back that fall with a smash hit, Sidney Kingsley's '43 *Men in White*, co-produced with Harmon and

Ullman '45. In 1935, incidentally, Clurman and Miss Crawford went to the Soviet Union for a five-week study of the Russian theater.

After six years with the Group Theatre, which had been torn by dissension during the last years, Miss Crawford resigned in April 1937. She announced her intention of becoming an independent producer, an unusual occupation for a woman. According to Kyle Crichton, her first undertaking was *Four Cents a Word*, but she never brought it out of rehearsal. "Slight doubts began to annoy me," is the way Miss Crawford puts it. In early 1938, however, she presented *All the Living*, directed by Lee Strasberg, a study of conditions in an overcrowded, understaffed state institution for the insane. *Theatre Arts* called it "a first production she may well be proud of"; the *New Republic* came closer to the consensus by saying, "You have to do a good deal of shaking down to get its best content quite clear of drifting clutter, but that the result is worth the effort." The public apparently did not care to make that effort. "This was the time of my dizzy spells," says the producer.

After this, writes Crichton, "it took her a year to get her bearings. She mistrusted her judgment, her health was affected, and she was financially a cipher. A friend invited her to stay in the country, and she left Broadway with eagerness." The next Crawford production, Maxwell Anderson's '42 *Family Portrait*, was presented in March 1939, with Judith Anderson '41 as Mary, the mother of Jesus. (Miss Crawford had deliberately "cast against type," feeling that Miss Anderson's force and power would save the role from insipidity.) Staged by the well known Shakespearean director Margaret Webster, who also played Mary of Magdala, *Family Portrait* was highly praised by reviewers but was a partial financial loss. Cheryl Crawford and John Wildberg next took over the 1,400-seat summer theater at Maplewood, New Jersey—and lost $6,000 on their first two productions there. "We decided we were licked, anyway," says Miss Crawford, "and brought in a play *we* liked: Tallulah Bankhead '41 in *The Second Mrs. Tanqueray*." This was very successful, and the producers followed it up with other Broadway-level plays for week-long showings at half the Broadway prices. The Maplewood playhouse, which continued to be their base of operations, flourished and, in her words, Cheryl Crawford "stopped being a neurotic mess." She began to work at building up a future audience, holding discussions between the acts and giving lectures between shows.

In January 1942 Miss Crawford returned to Broadway with her long-planned revival of George Gershwin's "folk-opera," *Porgy and Bess*. When produced by the Theatre Guild in 1935, it had been a critical success but a financial failure; but Miss Crawford, assisted by John Wildberg, turned it into a resounding hit. Spoken dialogue was substituted for Gershwin's recitatives; the orchestration was thinned out and generally clarified; various touches of pretentiousness were eliminated. With most of the original cast, under the baton of Alexander Smallens and the direction of Robert Ross, the revival moved "more confidently, more dramatically, and more honestly than ever before," to quote Richard Watts, Jr. Despite the large orchestra required, Miss Crawford managed to hold production costs down to $16,200—"an astonishingly low figure," made necessary because of her difficulty in finding backers—and made a reported net profit of $5,000 weekly. The show ran nine months on Broadway, unprecedented for a revival, toured for a year and a half, returned in September 1943 to let New York have another look, toured the South and West, returned in the spring of 1944 to do "incredible things" to the box office of the City Center, and went right on touring. But its producer was not immune to headaches. The season in which she launched *Porgy and Bess* also saw her ill-fated revival of Barrie's *A Kiss for Cinderella*, starring Luise Rainer, and the unfortunate *The Flowers of Virtue*, which she managed for Marc Connelly.



CHERYL CRAWFORD

Although an average of fifteen scripts a week came to Miss Crawford's office, none were satisfactory. For her next production (with Wildberg), she asked S. J. Perelman and Ogden Nash '41 to write a musical comedy book based on F. Anstey's story, "The Tinted Venus." Then she got Kurt Weill '41 to do the music, Agnes de Mille '43 to work out the dances, Mary Martin '44 from Hollywood to play the title role, Kenny Baker from radio and John Boles from movies to co-star. The result was *One Touch of Venus*, which took the town by storm in October 1943. The selection of Mary Martin was especially praised: "Only Miss Martin, I think," wrote Howard Barnes, "could get away with being an animated statue of . . . the top glamour girl of the Hellenic age." Ballerina Sono Osato '46 was another hit of the season, and Miss Crawford soon rewarded her with featured billing. With a production cost of $145,000 and a weekly salary list between fourteen and fifteen thousand, *Venus* grossed a reported $1,650,000 during its first year in New York, plus a $150,000 advance from Mary Pickford '45 for the screen rights; two months later it started its tour. After the production cost was repaid, Crawford and Wildberg reportedly shared the remaining 50 per cent of the gross.

CRAWFORD, CHERYL—*Continued*

Meanwhile, in October 1944, Miss Crawford's production of *The Perfect Marriage,* with Miriam Hopkins and Victor Jory, was called "singularly uninspired." It closed in January 1945, and shortly afterward Miss Crawford presented Margaret Webster's production of *The Tempest,* with the ballet dancer Zorina '41 as Ariel and the Negro actor Canada Lee '41 as Caliban. Its $50,000 cost was supplied by a reported twenty-seven backers. Played on a multilevel revolving stage, and with music scored by David Diamond, *The Tempest* was acclaimed by reviewers and ran for 101 performances, an all-time record (the previous high for performances of "this most difficult of Shakespeare's plays to stage" was thirty-two). It went on tour in September 1945, including an engagement at the New York City Center.

About this time Cheryl Crawford announced the result of many months of planning—a repertory theater supervised by Margaret Webster, Eva Le Gallienne, and herself, to be opened in September 1946. Miss Crawford, who is business manager, put a stock issue on the market late in September 1945, and by early November announced that two-thirds of the required $300,000 had already been raised. The American Repertory Theatre, Inc., as it is called, is to have a repertory of six plays to be prepared by a company of about thirty actors, under contract for a minimum of two seasons, and headed by Eva Le Gallienne and Victor Jory.

The Ohio-born producer is described as "brisk yet gracious, and comely with her blue eyes, tailored clothes, and short, wavy dark bob." Generally calm, she seldom attends her own premières because the strain is too great. Miss Crawford is said to have read "everything in poetry" and to remember all of it, and is credited with the most complete collection in existence of American popular sheet music since 1900. On the slightest encouragement, her friends say, she will sing any old popular song one can name with more enthusiasm than voice, and tell who wrote it. But Miss Crawford's main preoccupation is with the theatrical possibilities of anything she comes across: "In fact," wrote Mary Anderson in the New York *World-Telegram,* "it is her belief that everything, whether it's cooking her specialty of spareribs with an original sauce, delving into psychoanalysis, or listening to a symphony, bears on the theater." She seldom has lunch: "On light days," Miss Crawford says, "I sometimes have a double orange juice in a drugstore."

CRIST, WILLIAM E(ARL) (krĭst) Aug. 10, 1898- United States Army officer

Address: b. c/o War Department, Washington, D.C.; h. 1417 44th St., N.W., Washington, D.C.

The manifold problems involved in the occupation of Japan have been the subject of international concern since General Douglas MacArthur '41 first assumed control of the defeated Empire in early September 1945. Serving under the Supreme Commander as chief of the military government section is Brigadier General William E. Crist, who is charged with the responsibility of maintaining law and order in Japan. Crist's twenty-five-year Army career had taken him to the Orient twice before, when he served for periods in China. In the course of the Second World War the General has seen duty in the Soviet Union, Hawaii, and on Okinawa, as deputy commander of the military government.

A Pennsylvanian, William Earl Crist was born in the capital city, Harrisburg, on August 10, 1898, the son of Samuel Curtis and Emma Levina (Orr) Crist. He attended the United States Military Academy at West Point, earning his degree in 1920. Upon graduation Crist was commissioned a second lieutenant, on July 2, and on the same date promoted to first lieutenant. Two months later the young West Pointer entered the Infantry School at Fort Benning, Georgia, from which he was graduated in June 1921. Crist then remained at the Infantry School as an instructor for two years. His next assignment, in July 1923, took him to Tientsin, China, where he was stationed with the Fifteenth Infantry at the American Barracks. Returning home in 1926, he joined the Twenty-eighth Infantry, serving at Madison Barracks, New York, for a year. Following this, for an eight-month period he was instructor in the Infantry Unit of the R.O.T.C. at Cornell University. By the summer of 1929 the Lieutenant was back at West Point as an instructor, where he remained for three years.

Crist's next assignment took him back again to China, in October 1932. As a Chinese language student, the American officer was stationed at Peiping until the following July, when he became acting assistant military attaché at Nanking. Now a captain (he had been promoted on August 1, 1935), Crist returned to the United States in 1936 to join the Sixteenth Infantry at Fort Jay, New York. In August 1937 he enrolled in the Command and General Staff School at Fort Leavenworth, Kansas, from which he was graduated the following June. Assigned to Fort Benjamin Harrison in Indiana, he served with the Eleventh Infantry and in September 1939 became plans and training officer of this unit. In November of that year he was transferred to Washington, D.C., and assigned to the Military Intelligence Division of the War Department General Staff. On July 1, 1940, he was promoted to major. After the United States entered the Second World War the officer rose rapidly in rank. Made a lieutenant colonel (temporary) at the end of 1941, he was advanced to colonel (temporary) in August of the next year, and to brigadier general (temporary) in March 1943. Early in 1943 he went from his duties in the Capital to Camp White, Oregon, to serve as assistant division commander of the Ninety-first Division, with which he remained until the end of the year.

In December Crist was assigned to the Army Group in Washington, and shortly thereafter he became head of the Army division of the United States Military Mission to the Soviet Union. In Moscow the General participated in significant negotiations with the Russians: It was this mission which arranged for extension of the Anglo-American England-to-North Africa shuttle-bombing experiment to the use of bases in the U.S.S.R. This bold cooperative venture was first planned by Roosevelt '42 and Stalin '42 at the Teheran meeting, and was inaugurated in June 1944, when American Flying Fortresses, protected by fighter planes, bombed targets in Rumania, then continued on their route to land on secretly constructed American air bases in the U.S.S.R. After refueling and reloading, the planes made the reverse trip, dropping bombs over Germany on the way.

The General went from the European theater to the Pacific in November 1944, joining the Tenth Army in Hawaii as chief of the Civil Affairs Office. Under the command of Lieutenant General Simon Bolivar Buckner '42, the Tenth Army invaded Okinawa, the largest of the Ryukyu Islands, on April 1, 1945. Crist landed on the island with the invasion forces, and there served as deputy commander for the Okinawa Military Government—the first military government director to go ashore on Japanese-controlled territory. During the campaign he was faced with the problem of handling the natives in camps; when the main battle ended on June 21 his troubles multiplied. For then began the trek of the refugees from the caves—by July 2 more than two hundred and fifty thousand civilians were under American care. Crist was thus confronted with the largest hostile population yet encountered in the Pacific. According to reporters on Okinawa, his administration was stern but just, and while tight control on civilians was exercised, the people seemed to respect the Americans and to show confidence in them.

U.S. Army Signal Corps

BRIG. GEN. WILLIAM E. CRIST

Discussing the American program on the island, Crist emphasized that the plan was based on the use of salvage. "We are determined to house, clothe, and feed the civilians from materials available on the island," he said, adding, "We will avoid the use of any article of which there is a shortage in the United States, and we will keep at an absolute minimum the use of American shipping in providing for civilians." Included in the regulation of scarce items were cigarettes and blood plasma. (Crist held that Okinawans could supply their own blood donors and not use American-donated plasma or whole blood.) On the whole, the military government sought to provide for the minimum humanitarian needs of the people "without pampering them." It was also pointed out that the military had no intention of raising the living standard of the natives, except in the matter of sanitation because of the presence of American troops on the island. John Beaufort, writing from Okinawa to the *Christian Science Monitor* in May 1945, noted that while Crist's handling of civilians had been strict, there was "no evidence of unfairness or undue harshness."

General Crist was reassigned in July 1945, this time to the Civil Affairs Division in Washington. Shortly after the Japanese surrender in August, he was fully instructed on military government policy and sent to join MacArthur's occupation forces in Tokyo. He became chief of the Military Government Division, responsible for the supervision of finance, public safety, health, utilities, and transportation. His forces consist of more than four thousand specially trained officers, including men with experience in the administration of various Pacific islands. Among his men are those trained in the military government schools of eight United States universities, plus the faculties of these schools, specialists in Japanese language, industry, law, and customs. In addition, specialists have been withdrawn from Europe for Japanese occupation service. Crist is considered well equipped for his present command, for it is believed that his service in China and with the Intelligence Division have provided him with valuable knowledge of Japanese mentality.

The wife of the Army officer is the former Margaret Koster, to whom he was married on May 14, 1921. They have a son, William Earl. The General is a Mason and belongs to the clubs Scabbard and Blade, and Sojourners.

CURRAN, JOSEPH E(DWIN) Mar. 1, 1906- Labor leader

Address: b. National Maritime Union of America, 346 W. 17th St., New York City; h. 870 Riverside Dr., New York City

A rank-and-file seaman in the early days of the merchant marine in the United States, Joseph E. Curran was also a natural leader, aggressive in action, progressive in viewpoint. As president of the National Maritime Union since its organization in 1937, president of the Greater New York Industrial Union Council since 1940, and vice-president of the CIO since 1941, he has become an outstanding leader of American labor.

Joseph Edwin Curran was born on New York's East Side on March 1, 1906. His parents, Eugene and Ida (Cohan) Curran, were Irish Catholics. Eugene Curran died when Joe was two years old; and his widow, who became a cook in Westfield, New Jersey, remarried. Joe's schooling was brief. After he was expelled from the seventh grade of the parochial school for his irregular attendance, he became a caddy, then a "factory monkey." At fifteen he went to New York City, where he took a job as office boy with the Gold Medal Flour Company. There young Joe could watch the ships on the near-by rivers, and it was not long before he had signed on his first ship as an ordinary seaman, in 1922 beginning a seventeen-year period at sea. He was paid thirty dollars a month, for which he often worked sixteen hours at a stretch.

At sixteen Joe was a "big, nervy kid who knew all the answers," in other words, a good talker and an aggressive leader. He soon compensated for his lack of education by reading—not fiction, but whatever else he could find in the ships' libraries or on shore, about world economic and labor conditions. He learned about ships and seamen primarily through firsthand experience: "Fo'c'sle" Joe sailed pretty nearly everywhere on the globe. And lurid stories are told of his early years, when living and working conditions in the merchant marine were tough. Today, Curran does not appreciate romances of the sea: "I've been to sea," he says laconically.

His background also accounts for the seasoned toughness of Curran that has earned for him the respect and loyalty of the men in his National Maritime Union. He first became a union man in 1935, when, in order to sign on the S.S. *California* sailing from New York, he joined the International Seamen's Union, affiliated with the A. F. of L. Even then, it is said, he did not think well of the organization: "Their officers were not seamen's officials, but shipowners' agents." He did not like the *California* either—the food and pay were bad, he said. When the ship docked in California, at San Pedro, her crew found out how much better the seamen's wages and conditions were on the West Coast, as the result of a strike of the previous year, and the men turned to Curran to lead them. He told the shipowners' agents that the *California* would not move unless her crew was given pay equal to that of West Coast sailors, and better conditions. When the newspapers reported the strike, it reached the attention of the Secretary of Labor, Frances Perkins '40, who informed Curran that if the crew would take the *California* back to New York there would be no discrimination against the men and their grievances would be given a hearing. Curran agreed to cooperate, but when the ship reached the East the owners discharged sixty-four of the crew.

This incident started the big East Coast strike in the spring of 1936: sailors began walking off ships and demanding the reinstatement of Curran and the rest of the ousted *California* crew. The officers of the International Seamen's Union threatened to expel those who joined the "outlaw" strike.

Meanwhile, while the strike was going on, the I.S.U. negotiated a contract giving pay raises to the crew. This agreement was challenged by Curran and the insurgents, however, because the terms fell short of the Pacific Coast wage scales which they had demanded. A request that the seamen be allowed to vote on the acceptance of the agreement was denied. According to Philip Taft in the *Political Science Quarterly,* "For the insurgents the strike was not only a struggle for higher wages, but a maneuver to embarrass the national officers of the seamen's union." The rank and file led by Curran, it is said, felt that men who were more recently sailors should replace the old-line incumbent officials. The strike dragged on for ten weeks. It was finally brought to a close upon the shipowners' promise that strikers would be reinstated, without discrimination. In October, nevertheless, a new strike broke out in another attempt to nullify the contract. Three months later it was formally ended, with no agreement having been reached. (The strikers claimed that the NLRB had assured them that elections would be held to determine collective bargaining representatives. Furthermore, it is pointed out, these insurgents were faced with financial difficulties.)

Out of this deadlock grew the National Maritime Union of America. Curran was determined to form a new body completely independent of the I.S.U. In May 1937 he led some thirty-five thousand members of the old union into his organization. (In June the right of the union to represent the men was decided by NLRB elections.) At the constitutional convention in July the new group voted to join the CIO. Curran was elected president, and he has been re-elected at each succeeding convention. With Joseph Kennedy['40], at that time head of the United States Maritime Commission, he was able to cooperate. When the Commission opened hearings in New York, Curran gruffly admitted: "This is the first time the seamen have ever had a chance to say what they really think at one of these things." They were allowed to state their complaints: lack of decent sleeping quarters, sanitation, good food, et cetera.

Curran soon became one of the most popular union heads in the country. As leader of the East Coast merchant mariners, he took a Left-wing stand similar to that of Harry Bridges['40], who headed the West Coast longshoremen. In contrast to the leadership of these men was that of the more conservative Joe Ryan of the International Longshoremen's Association and Harry Lundeberg of the Sailors' Union of the Pacific. Curran made friends quickly among the East and Gulf port employers with his long-term cooperative policies. As the majority bargaining agency for the ship and dock personnel of fifty-two major shipping lines on these coasts, Curran's N.M.U. negotiated contracts with many of them.

But Curran—independent, dramatic, outspoken—could not escape, from the beginning of his career, the charge of "Red," or "Communist," a charge the labor leader has repeatedly denied. However, all groups are welcomed by the N.M.U., and Communists have been among its most loyal members. Persons on both sides of the political fence have offered opinions on Curran's sympathy with, or awareness of, this radical element. Some declare that he is being "used" by the Communists for a "front"; others, members of the N.M.U., feel that he is aware of the Communists' influence, that when he is unable to cope with it he will oust these members. To the Dies['40] Committee's charges of communism in 1939, as well as to later charges in which evidence was submitted, Curran and his spokesmen retorted that such evidence was forged.

JOSEPH E. CURRAN

In July 1940 the Greater New York Industrial Union Council was organized—an affiliation of one hundred eighteen local CIO unions that corresponded to the Central Trades and Labor Council of the A. F. of L. Joseph Curran was unanimously elected president of the council, which represented between three hundred fifty and four hundred thousand local union workers. One of the resolutions adopted stated that "labor has declared its willingness and desire to cooperate in a genuine and effective program of national defense, the true cornerstone of which is the protection of labor's rights of self-organization and collective bargaining." Curran now held a position of considerable influence in labor circles.

Soon, however, charges arose that Curran was "using his office in the CIO . . . council for partisan purposes." Some resentment against certain of his acts came from within the more conservative CIO membership. These members disapproved of a telegram sent by him asking local unions to support the emergency peace mobilization in Chicago in August 1940, before the United States entered the war. Curran then said: "In my opinion, the mobilization of peace sentiment in this country is by far the most important issue facing the labor movement today." Of the group protesting his stand he said: "If these unions were as quick to protest conscription as they are to protest against the Chicago peace mobilization, they would be working in the interests of organized labor. . . .If it wasn't the peace telegram it would be something else. There are certain forces at work in this city to hamper the organization of the unorganized and destroy the prestige of the CIO." Later in 1940 his endorsement of John L. Lewis['42] (when Lewis called for the defeat of Roosevelt['42]) and his opposition to Lend-Lease contributed to the split in the CIO, with Sid-

CURRAN, JOSEPH E.—*Continued*

ney Hillman '40 leading the faction that endorsed aid to Britain, and the Communists supporting the isolationist stand. Curran, it was argued, had been forced into his Lewis endorsement by the Communists. (Curran at this time was running for Congress on the American Labor Party ticket.) Curran, however, issued a call in May 1941 for seamen who had gone into other fields to return to merchant ships to assist during the emergency.

After the Nazi invasion of Soviet Russia, the N.M.U. reversed its isolationist stand, leaving Curran to answer a good deal of criticism. At the union's national convention in July 1941 he declared, "We recognize the present struggle of Great Britain and the Soviet Union against the forces of fascism to be sincere and requiring the full support of all liberty-loving people throughout the world." He declared that the N.M.U. would not abandon its drive for higher wages and improved working conditions. But his proposal that all seamen on the East and West coasts and on the Gulf unite under the banner of the N.M.U. was flatly rejected by an official of the Seafarers International Union of the A. F. of L. At its convention the N.M.U. also voted down a "Red inquiry" move—a proposal that an outside trial board be set up to investigate the charges of communism against Curran—and it adopted a resolution for discontinuance of the Dies Committee. Curran has also defeated other moves to investigate N.M.U. membership.

After the United States entered the war Curran devoted himself to the war effort. At the national council meeting of the N.M.U. in 1942 he said that everything must be subordinated to the one great task—that of defeating Hitler '42 and the Fascist aggressors: "As seamen, our major task is to man the ships, even at great personal sacrifice, and guarantee the delivery of the vital war materials and supplies to every part of the world where our forces and those of our allies are fighting." He was reported to be especially pleased when a Liberty freighter, the *Booker T. Washington,* was put in charge of a Negro captain, with both white and Negro officers serving under him: Curran had been the first maritime leader to welcome Negroes into his union. In March 1943 Curran announced to the State Department that his union had refused to man ships carrying goods to Spain. That same year, in July, he accused the War Shipping Administration of misinforming the public by its complaint that there were not enough vessels for wartime shipping. There were hundreds of vessels, Curran claimed, lying idle, or being used for unnecessary luxury shipping. There was no shortage of seamen either, he stated. He also demanded a second front in Europe.

The war years continued to be stormy ones for both Curran and his union, although Admiral Russell Waesche '45, Commandant of the Coast Guard, paid tribute to the work of the merchant marine in the war, and Anna Rosenberg '43, regional director of the WMC, commended the N.M.U. for keeping its wartime no-strike pledge. But charges and countercharges continued to come from other quarters. In early 1943 the N.M.U. faced the charge—denied by the Army and Navy as well as by the union—that union seamen would not unload ships at Guadalcanal. Four million dollars' worth of libel suits were brought by the N.M.U. that year.

That same year, Curran and Westbrook Pegler '40, the well known columnist, "tangled." Part of the fireworks were set off over the union leader's draft status, Pegler raising the "fellow traveler" charge, and accusing Curran of draft-dodging. The union leader's draft board had deferred him as an essential worker whose job it was to keep American merchant ships manned. Curran claimed that he had not asked for this status, but had petitioned the board to let him serve as a merchant sailor. In September, while Curran was overseas investigating conditions of merchant mariners abroad, he was granted a new deferment, then the same month transferred to 1-A. (Curran had not notified his draft board before going abroad, and his deferment had expired in his absence.) Leon Henderson '40 came to his defense, declaring that the reclassification was motivated at least in part by "disagreement with Curran's policies and his extreme Leftist political views. . . .If the draft can be used to punish Joe Curran, none of us are safe." The newspaper *PM* also called the situation "an outrage," declaring, while "we don't agree with Curran, that isn't the issue here, and in this fight we're in his corner."

When Curran arrived back in the United States he appeared before his draft board, explaining that he had had no intention of violating the Selective Service Act. The local board considered his explanation satisfactory, and his union appealed his 1-A status to President Roosevelt. The President heeded the appeal, and on November 6 Curran was again reclassified as 2-A for six months, thus removing all possibility that he would be drafted, since by that time he would be over draft age. Commented Westbrook Pegler: "It was a foregone conclusion. . . .Thus the Navy Department protects the Navy's enemies." The Presidential order was also criticized by certain Congressmen, including Senators Harry F. Byrd '42 of Virginia and E. H. Moore of Oklahoma.

Curran's overseas trip also came under attack, while the labor leader himself made countercharges. He claimed that the State Department had delayed his request for a passport, so he had shipped out on his seaman's passport. "When we arrived at a North African port every member of the crew was given shore leave," he declared, "with one exception—Joseph Curran." He reported that he was told if he stepped down from the gangplank he would be shot on sight. "I can only think that some interests in the State Department wanted to keep me from seeing things." Nonetheless, he said, he learned enough to ascertain that merchant mariners were "not being treated as they should be, although they are delivering and working under adverse conditions." In various undisclosed ports he said he had found that ship survivors (merchant seamen) lacked proper medical care, or were neglected by consular officials.

Curran made more news early in 1944 when he was one of the few labor leaders to support President Roosevelt's call for a national service act. "There is no terror in a national service law," he said, "for ever since Pearl Harbor we have imposed one on ourselves, voluntarily." The more Right-wing groups of the CIO stood behind Philip Murray '41 in opposition. But by January 27 the Left-wing leaders reversed their stand, lining up solidly with the rest of the CIO and a resolution opposing the Austin '44-Wadsworth '43 bill was unanimously adopted.

At the Truman '45 Senate committee meeting in Washington on March 8 Curran defended the Liberty ship as a sound cargo vessel, following a charge that they "cracked up" under stress of war service. Curran said in addition that certain groups and newspapers were trying to make political capital out of reports about Liberty ship failures. He joined with other progressives in the organization of the National Citizens Political Action Committee; and he was among those to demand a special session of the New York State Assembly to amend the State War Ballot Law to extend full voting rights to members of the merchant marine and other services outside the United States who could not vote under the State law. (Merchant seamen were not considered servicemen in the meaning of the act.) In April he joined with Basil Harris, president of the United States Lines, in urging for merchant seamen benefits such as those afforded war veterans by the GI Bill of Rights

In July 1945 Curran and the N.M.U. picketed the War Shipping Administration offices in Washington—Curran insisting that it was not a strike but a publicity campaign for a basic fifty-five-cent hourly wage. The war risks bonus paid to seamen on the Atlantic run, which had boosted the take-home wage from little more than twenty dollars a week to about fifty, had been cut by two-thirds by the Maritime War Emergency Board after the surrender of Germany. While Curran conceded that as the war risks went down the bonus would have to go too, he and his union had no intention of going back to prewar wages. In August 1945, when strikes and lay-offs followed close on the heels of victory over Japan, the Greater New York Council of CIO demanded in a rally that Congress adopt a full employment bill, a sixty-five-cent minimum hourly wage bill, and an unemployment insurance bill providing twenty-five dollars a week for six weeks. Early in September the WLB approved an increase of forty-five dollars a month in the base pay of seamen, to take effect immediately upon elimination of the war risks bonus on October first. During the New York strike of the International Longshoremen's Association in October the N.M.U. supported the rank and file committee of the A.F. of L. affiliate against the leadership of I.L.A. President Ryan. In the course of this controversial strike, the Greater New York CIO Council denied charges of interfering in the internal affairs of the I.L.A., while urging support of the strike for "improved wages and working conditions, and for their [the strikers'] right to a voice in their own affairs."

During the last months of 1945 Curran led an N.M.U. campaign for the speedy return of servicemen from overseas, urging the Government to use every available ship to bring the GI's home. This bring-the-boys-home-by-Christmas campaign was climaxed on December 3 by a twenty-four-hour work stoppage on commercial cargo ships in Atlantic, Gulf, and Pacific ports, excluding vessels carrying troops and relief supplies.

In February 1945 Curran was one of the delegates meeting in London for the purpose of organizing a new world labor body which (unlike the International Federation of Trade Unions) would include representation from the CIO and labor delegates from Russia. On their return to the United States the CIO delegates were prominent speakers at a world unity rally held on March 12 at Madison Square Garden, New York. Curran presided at the rally, which urged the A.F. of L. to join the new movement: "The formation of the new world labor movement provides ample opportunity for the A. F. of L. to come back into the international house of labor, which we strongly urge, and participate with other international labor organizations in the perfection of a peaceful and democratic world." As a CIO delegate to the World Trade Union Conference in October, Curran was present at the Paris sessions when the new World Federation of Trade Unions was formed. Shortly thereafter he was a member of the CIO delegation which visited Moscow, the first trade union delegation to go to that country since 1927. Curran and the entire delegation endorsed the proposal made by Soviet labor leaders to set up an American-Soviet trade union committee to facilitate cooperation between American and Russian workers. A month later, in November, the maritime leader was an alternate delegate of the CIO at the labor-management conference in the Capital.

In addition to his activities on behalf of labor unions, Joseph Curran also serves as a member of the regional board of the War Manpower Commission. He writes a weekly column for the *Pilot*, the official N.M.U. paper, and is the author of a number of pamphlets published by the union, including *Pork Chops and Politics*, *Take the Helm*, and *Listen, Brothers!* He was married to Retta Toble, a former "shipmate" on the Grace Line, in 1939, and has one son, Joseph Paul, born in December 1943. The busy union leader has never had much time for hobbies. One time, back in 1931, he thought he would like to raise prize dogs, feeling that might be more profitable than going to sea. He went so far as to buy eleven spitzes in Odessa, but after caring for the unhappy dogs and five new puppies in the ship's storeroom, he gave up the venture. His most recent hobby and recreation has been photographing his young son.

CURTIS, ANN Mar. 6, 1926- Swimmer

Address: b. c/o Crystal Plunge Pool, 775 Lombard St., San Francisco

Champion amateur swimmer of the United States, Ann Curtis since mid-1943 has set national and world records unequaled in the history of women's competitive swimming. Although commentators say that in 1945 she has not yet reached the peak of her performance (a woman swimmer usually reaches her peak between nineteen and twenty-one), Miss Curtis is already considered "the greatest free-styler ever developed in the United States —perhaps anywhere." Holder of seven national titles, two world records, and eighteen American records, "the queen of the amateurs" has received the James E. Sullivan award as the outstanding athlete of 1944.

ANN CURTIS

Ann Curtis was born in San Francisco on March 6, 1926, the daughter of Marvin Curtis, Jr., and Florence Gertrude (Donohue) Curtis. Ann became interested in swimming when she was about nine years old. While the girl was attending Ursuline Convent School at Santa Rosa, California, one of the teachers noticed her ease of movement in the water and suggested that she swim at least an hour each day, a pastime Ann found very pleasant. After a year and a half at the convent, she returned to San Francisco to continue her elementary education at Commodore Sloat Grammar School. These were busy days for little Ann. Besides going to school, she helped her mother at home, in their "guest house," by waiting on tables and washing dishes. "At one time," Miss Curtis says, "my future interest in swimming was threatened by an antipathy for water developed by association with sinks full of dirty pots and pans. If swimming pools had suds on them, I'd probably be a golfer or a soft-ball pitcher."

Ann spent her free time at the Jewish Community Center of San Francisco, receiving instruction from the pool director, Charlie Duhamel. Duhamel, impressed with her prowess, entered the eleven-year-old swimmer in the 1937 Amateur Athletic Union Championships in the city, in the free-style race for girls under sixteen. With little effort, Ann swam to victory. That fall she broke her first authentic record, winning the 100-yard event in the Pacific Coast Senior meet with a speed of 1:10. In the two years following she continued to win in minor competitions, but threatened no other records. According to Duhamel, she "lacked the imagination to be a champion."

In 1939 the young girl began to study aquatic ballet with Phil Patterson at the Fairmont Hotel in San Francisco, going to the pool after her classes at the Roosevelt Junior High School. After a year and a half of these lessons she realized that she was more interested in competitive swimming. In 1940 she therefore entered the 440-yard free-style event in the West Coast Championships, but in this race she finished seventy yards behind the winner—"I was fat and short-winded," says Miss Curtis. On the advice of her mother the discouraged future champion placed herself under the direction of Charles Sava, the famous racing coach, at the Crystal Plunge Club in the city.

Sava immediately set up a vigorous two-hour daily routine for the young swimmer to develop her arms and legs. ("I lost seven pounds in the first ten days with Sava," she says.) Realizing that her long arms might handicap her in the shallow part of pools, the instructor taught her a lateral arm stroke in which her fingers are never more than two feet beneath the surface of the water. He also began intensive training on her knee action, since it is his belief that most girl swimmers rely too much on their arms. To develop her leg power, "he looped a rope through a pulley above the pool, attached a nine-pound weight to that and lashed the other end to her ankles. For thirty minutes [each day] she kicked against this drag to force her way through the water without using her hands. After that Sava would bind her ankles and dunk her, with only her arms between her and complete immersion, something after the manner of Jack Kearns in sending Jack Dempsey '45 against bloodthirsty sparring partners with his right arm lashed behind him."

It was not until June 1943 that Sava, certain that Miss Curtis was champion material, entered her in the Far Western Championships in San Francisco. (Before the race Sava advised her to "just go in and get loosened up.") Far from disappointing him, she broke Ann Petty's eight-year-old record for 220 yards, and won the 440-yard race by thirty feet. In July she set an American woman's mark of 1:01.8 for the 100-yard event, defeating Brenda Helser, the reigning national champion. During that month Miss Curtis also broke the 200-yard record, and in November the 500-

meter record. In December she was chosen by the Pacific Association of the A.A.U. as the outstanding woman athlete of the West Coast for 1943.

In 1944 Miss Curtis broke a record almost every time she participated in a swimming match. Competing in the National Indoor Championships at Oakland in May, the new aquatic star set marks of 2:30.2 for 220 yards, 2:28.3 for 200 meters, and 5:12.7 for 440 yards, but lost the 100-yard contest to Miss Helser. Two months later she broke her own records for 400 meters, 440 yards, and 500 yards established earlier that year. In July Miss Curtis achieved international fame. In the 880-yard free-style swim she finished in 11:18.6, lowering by seven and a half seconds the world mark established by Ragnhild Hveger in 1937. During that month she also set new American marks for the 800-meter and 880-yard races, (In the latter race she passed the 800-meter mark at a speed which broke the world record for the distance. Without stopping she finished the course, setting another record for the full distance of 880 yards.) In the three-day A.A.U. Women's National Swimming Championships at Kansas City, Missouri, in August, Miss Curtis became the third person in swimming history to score a "grand slam" by winning four national free-style titles—she won the 100-, 400-, 800-, and 1,500-meter free-style swims.

At the National A.A.U. Women's Indoor Swimming Championships held at Chicago's Town Club Pool in April 1945, the Crystal Plunge team, composed of Ann Curtis, her sister Sue, and four others, won with forty-seven points. Vying with Brenda Helser (considered one of the finest swimmers in the country) in the 100-yard event, Miss Curtis was behind her for most of the distance, but edged by her in the last fifteen yards to take the only important A.A.U. title she had not already held. She also defended her 220- and 440-yard titles, and finished the 440-yard event in 5:30.9, "loafing all the way." Miss Curtis' individual achievements, coupled with the team's victory in the 400-yard free-style relay, made the Crystal Plunge team the victors of this meet.

At the end of this swimming contest Miss Curtis was presented with the James E. Sullivan Memorial Trophy for 1944, which is awarded annually to the outstanding amateur athlete of the year. She is the first woman and also the first swimmer to receive the trophy in the fourteen years of its existence. The inscription on the trophy reads: "National A.A.U. Champion, 100, 400, 880, 1,500 meters outdoors, and 220 and 440 yards indoors. [She now also holds the 100-yard championship.] 1944-holder of two world and eighteen American records. The world records: 800 meters and 880 yards, 11:08.6. By reason of her qualities of leadership, strength of character, force of personality, high ideals of amateurism, and excellence of performance, she was selected by a tribunal of 800 sports leaders as the amateur athlete who did most in 1944 to advance the cause of sportsmanship."

The "Curtis Crawl," which is responsible for the swimmer's grace and speed, demonstrates her fine arm and leg synchronization. Her powerful legs produce a thrust when she dives into the water. She hits in a flat position, in order not to sink too low, with chin forward, water line at forehead, shoulder level with the surface of the water, and arms extended. Her movements in the crawl consist of eight leg beats to one complete arm cycle. The swimmer's speed in the water is attributed to her powerful shoulder muscles and this forceful leg drive. Says Sava: "Ann is just about the greatest girl swimmer this country has ever produced, and should there be postwar Olympics, she'll be in there splashing and winning."

Miss Curtis was graduated from Washington High School in San Francisco in June 1944, and enrolled in the University of California, where she began taking home economics courses. Pretty, with a well-proportioned figure, the swimmer has had several offers to appear in motion pictures, but she has refused them, for she does not like doing water ballets, which the movies usually feature, and she is eagerly waiting for the next Olympics.

In typical American schoolgirl fashion, she usually wears bobby socks, skirts, and blouses or sweaters, and ties a scarf over her short chestnut hair. When she is on dry land Miss Curtis will sometimes play badminton and table tennis, which she is said to do well. She also devoted some of her time during the war to volunteer work for the Red Cross. Her biggest problem in rubber-scarce 1945 was bathing caps. Early in the year she had only two left. "If anything happened to them," said the swimmer, "I'd be sunk."

DALTON, HUGH 1887- British Government official; economist

Address: b. House of Commons, London; h. West Leaze, Aldbourne, Wiltshire, England

The Chancellor of the Exchequer, the second highest Cabinet officer of the United Kingdom, has since July 1945 been the Right Honorable Hugh Dalton, M.P., P.C. A Socialist economist of high standing and an authority on international trade, Dalton had been a Labor Party member of Parliament for many years and had served in Winston Churchill's '42 War Cabinet as Minister of Economic Warfare. As President of the Board of Trade, he had for three years controlled Britain's economy when the general election of 1945 swept

HUGH DALTON

the Laborites into power for the first time in sixteen years, and Prime Minister Clement Attlee '40 appointed Dalton to the exchequer post.

Hugh Dalton was born in 1887 at Neath, Glamorgan County, Wales. He is the only son of the Reverend Canon John Neale Dalton, K.C.V.O., C.M.G., and Catharine Alicia (Evan-Thomas) Dalton, of the Gnoll, Neath. (He has one sister.) Canon Dalton, himself the son of an Anglican rector, had served for six years as tutor to the future King George V and his brother Prince Albert Victor; at the time of Hugh's birth he was canon and precentor of St. George's Chapel at Windsor Castle; and during Hugh's childhood he was a chaplain in the royal household. "What a loud voice that child has . . . just like his father," Queen Victoria is reported to have said of Hugh—a sentiment shared, then and later, by many less exalted personages. When the boy was ten, incidentally, his uncle Cornelius Neale Dalton became Controller General of Patents, Designs, and Trade Marks, and was later knighted.

Young Dalton studied at Eton and went on to King's College, Cambridge, where he won the Winchester Reading Prize in 1909. He took his M.A. there, and from 1911 to 1913 he studied at the London School of Economics on a Hutchinson Research Studentship, winning his D.Sc. In 1914 he was a lecturer at the school. The same year the twenty-seven-year-old economist also passed the required legal examinations and was called to the bar at the Middle Temple; but he did not begin practicing law until after the First World War. He was married to Ruth Fox in the first year of the war.

Dalton served five years in the Army Service Corps and later in the Royal Garrison Artillery. He saw action on the French and Italian fronts; and in 1917 Italy awarded Dalton what he calls "a nice bit of blue ribbon"—the Medaglio al Valore Militare—for "getting some guns across the Tagliamento River during an Italian retreat." In 1919 he returned to his economic studies, and at the same time set up his law practice. Dalton's war experiences resulted in a book, *With British Guns in Italy* (1919); they also resulted in a determination to prevent any future wars. The newly formed Labor Party seemed to him to offer the best hope of permanent peace. Its program called for the establishing of a minimum standard of living, and for "the use of surplus and idle wealth for the common good." Dalton "rapidly gained prominence in the party as an economist who wrote prodigiously in support of Labor policy." His books include *Inequality of Incomes in Modern Communities, The Peace of Nations,* and later, *Hitler's War Before and After* (1940). *Principles of Public Finance,* first published in 1923, had gone through ten revised editions by 1939, including a printing in the United States.

In 1914 Hugh Dalton had been attached to the Ministry of Labor for special investigations. In 1922, while he was the Sir Ernest Cassel Reader in Commerce at the University of London (a post which he held from 1920 to 1925), the tall, handsome economist stood for election to the House of Commons from Cambridge Town. According to the British Information Services, he "established something of a record by fighting five elections in thirty months, winning the fifth try in 1924 when he became member for Peckham," a division of Camberwell. (An M.P. need not live in the district which elects him.) In February 1929 Dalton was joined in Commons by his wife, the Labor member from the Bishop Auckland Division; they were said to be the third couple to serve in Commons at the same time. After the May 1929 general elections Dalton was returned to Commons from Bishop Auckland, which is a coal and iron district in Durham. (During this period, 1925-36, he was reader in economics at the University of London.)

When Ramsay MacDonald, the Labor Party leader, became Prime Minister in 1929, Dalton was chosen Parliamentary Undersecretary at the Foreign Office. "He is a highly talented linguist, which is unusual in a member of the British Government of any party," writes Patricia Strauss in *Bevin and Co.*; and he was "an able assistant" to Arthur Henderson, the Foreign Secretary, in the years between 1929 and 1931. He was Britain's representative at the League of Nations in 1929. "With Henderson he negotiated the evacuation of British and French troops from the Rhineland" in 1929-30. As Undersecretary for Foreign Affairs, Mrs. Strauss observed, he was "both able and happy, feeling he was laying the foundations of a foreign policy that would protect the world from war. Then came the MacDonald betrayal of 1931 [when the Laborite Prime Minister left the party]. Although Dalton is regarded as overwhelmingly ambitious, he refused MacDonald's blandishments and unhesitatingly stood with his colleagues in the Labor movement."

In the subsequent election he lost his seat, as did a large number of other Labor Party members. He then returned to the London School of Economics as a lecturer, and while there wrote *Practical Socialism for Britain* (1935), now a standard work in the field. Since 1931 he has also written widely on international relations, and is, says Mrs. Strauss, "the principal drafter of resolutions and pamphlets for the Labor Party on all matters of foreign policy. With all his Labor colleagues, except the convinced pacifists in the movement, he recognized that fascism was a menace which must be opposed even if it meant resisting with armed force." Dalton had an opportunity to see fascism at work in his travels, which took him throughout Europe and the United States. "From the time Adolf Hitler '42 came to power in Germany in 1933," says the New York *Times*, "Mr. Dalton strove to persuade the Parliamentary Labor group to abandon its opposition to rearmament, which was done in 1937." In 1935 he was again elected member from Bishop Auckland. Dalton is said not to have had great personal popularity, although his hard work and driving forcefulness made him "the strong man of the Party." (In 1936-37 he was chairman of its National Executive.)

The Second World War brought Dalton into the Cabinet. The economist, who had been "one of the most bitter critics of the Baldwin and Chamberlain governments and of the Ministry of Economic Warfare," was handed the latter portfolio in May 1940, when Conservative Winston Churchill formed his Coalition Government, in which Attlee became Lord Privy Seal. Dalton undertook a task which the Associated Press described as "much bigger than the Ministry of Blockade, which was the only comparable office in the . . . War Cabinet, since it takes in the whole field of closing the seas of the world to Axis commerce, fighting in world markets for essential supplies, and directing bomber squadrons to hit where the dictators' internal economy will be hurt worst." During the Battle of Britain he "slept in a basement shelter amid boiler pipes, where he was often found reading at 4 A.M.," and "often embarrassed his staff by appearing at his office before 8 A.M. . . .When an air raid was on, he was more likely to be found on the roof than in a shelter. He put out a number of incendiaries himself and had a close call when a bomb blew out the windows of his office and two of his staff were fatalities."

In 1942 Dalton became President of the Board of Trade, a post corresponding to the American Secretary of Commerce; as such, "the long sequence of decrees framed by him have had more effect on the lives of men, women and children in England than those of any other Minister, with the exception of Lord Woolton '40, the Food Controller." "Utility" and "austerity" were the key words in Dalton's program; he made shabbiness patriotic. "Not a box of tin tacks can be sold in a village store in the most obscure corner of Britain's countryside without the tacit permission of Mr. Dalton," wrote Augustus Muir. "He has a stranglehold upon everything save the contents of the pantry. . . .If anything is notable for its absence, it is a grumble about the Dalton austerity drive. . . .

"Mr. Dalton," continued Muir, "is not an easy man to work for. That is, he is out to win the war hell-for-leather, and he expects every member of his staff to keep pace with him. He sleeps in a room next door to his office, and walks straight from an eight o'clock breakfast to his desk. You will find him back at the same desk after dinner at night, and he has a skeleton staff always on late-night duty. . . .Seldom does he see Mrs. Dalton, whose own hands are full with important war work in the Midlands." In July 1943, Dalton took an unprecedented action in denying J. Arthur Rank '45, who controlled a twenty-five-hundred-million-pound motion picture combination, any further extension of his interests in the film industry. Dalton based his stand on the War Time Emergency Powers Act, having no statutory power to prevent monopolies, and was said to have acted on the motion of the Trades Union Congress.

At the first general election in ten years, held in July 1945, the Labor Party had an overwhelming majority. Attlee, of course, became Prime Minister, and Hugh Dalton was given the second-ranking Cabinet post, Chancellor of the Exchequer. Herbert L. Matthews '43 cabled to the New York *Times* that Dalton was a compromise choice between Ernest Bevin '40, who became Foreign Minister, and his rival Herbert Morrison '40, who was named Lord President of the Council and Parliamentary leader. Sir Stafford Cripps '40, the brilliant "problem child" of the party's Left wing, replaced Dalton on the Board of Trade—two appointments which the conservative *Daily Mail* asserted were unpopular with finance, business, and industry. No doubt the editors were thinking of statements such as Dalton's 1936 pronouncement that the Labor Party program "must contain a substantial measure of socialization, enough to occupy usefully a Parliament five years long. The Bank of England and the armaments industry . . . would not, in my opinion, be enough. We should, I think, need to add coal, and some at least of its by-products, and electric power, and a large part of transport, and to provide for a rapid increase in the public ownership of land and for effective economic planning, including public control of new investment and the volume of credit. . . .Socialists could not claim less and still hope to deal with unemployment." The platform on which Labor had won the election included these points plus immediate broadening and increasing of social security, and Government control of housing, employment, and agriculture.

While the Labor Government at first moved slowly in its nationalization policy, it moved nevertheless toward "establishment of the Socialist Commonwealth of Great Britain"—not by confiscation, but through "fair compensation." To the Bank of England shareholders, for instance, the Government planned to issue four-hundred-pound securities at 3 per cent in exchange for each hundred-pound share of stock, thereby continuing the very high return stockholders had received for the preceding twenty-three years. Another pressing problem facing Chancellor Dalton was that the United Kingdom must "export or die." He took steps to cut down imports to "absolutely vital" food and raw materials, to conserve dollar balances. In late October Dalton stated that the Government intended to balance the budget only in periods of prosperity, deliberately creating Treasury deficits to stem depressions. That

DALTON, HUGH—*Continued*

November he said, "It is a necessary feature of any financial plan that we should control both priorities and timing of investment so that the projects of greatest national importance come first . . . to achieve our chosen ends—full employment and a balanced development, both for home trade and for export, of all our productive resources." After twelve weeks of negotiations, the United States and Britain signed an agreement providing for a loan to Britain of nearly four and a half billion dollars ($4,400,000,000), at 2 per cent interest over a fifty-year repayment period, to begin five years after the ratification of the agreement. (In December both Houses of Parliament approved the terms after some days of lively debate.)

The new Chancellor warned against "any extravagant hopes of relief from heavy taxation" (during the war even the lowest-paid workers were taxed half their incomes) and predicted a probable greater scarcity of food and clothing. When his budget was presented in October 1945, however, it proved to be an "almost miraculous" one, which "pleased the rapidly dwindling well-to-do by taking a shilling off the income tax when no relief was expected; pleased the poor by landing another leveling wallop on the rich with an increase in the surtax; and pleased big business by reducing the 100 per cent excess-profits tax by 40 per cent." Opposition Leader and former Chancellor Churchill praised it generously. In reading the budget, reported Mollie Panter-Downes, Dalton "introduced, for a Chancellor, a couple of pleasant innovations by sounding jolly and reasonable, which made the first Socialist budget sound more like the arguments of someone with a neat sense of humor and a good head for figures than like the involved, funereal economics through which in past years Britons have had to plow their gloomy way. Mr. Dalton has a mellow, booming voice which indoubtedly would have won him top honors in the church and which is a relief to correspondents. . . .His first budget has shown him to be one of his party's strongest ministers."

A reported later plan of his and Cripps's to devalue the pound, which had been pegged at $4.03, for the purpose of increasing Britain's export market, was said to have been dropped after the United States expressed opposition to it; and a plan to peg all Commonwealth money to the pound, leaving the pound free to fluctuate, was dropped as a result of Dominion opposition.

Dr. Hugh Dalton (who has D.Sc.'s from Sydney and Cambridge) is a powerfully built six-foot man with a bald head and unusually pale blue eyes. He has "a laugh like a high explosive" to match his voice, and is said to dress conservatively and expensively. (Dalton has a comfortable private income.) His favorite recreations, in addition to travel, are chess, tennis, long country walks, and digging in his Wiltshire garden. He has served on the council of the Royal Statistical Society.

DAMASKINOS, ARCHBISHOP 1891-
Regent of Greece
Address: b. Scaramanga House, Athens

Since the end of December 1944 attention in the Greek political crisis has repeatedly centered upon Archbishop Damaskinos, the Primate of the Greek Orthodox Church, who has been likened by Pertinax '40 to those bishops "who in the Middle Ages, were as much at their ease storming enemy troops and capturing cities as officiating in their cathedral church." Appointed Regent of Greece on December 31, 1944, the Archbishop also found it necessary to undertake the duties of Premier for a period of two weeks in October 1945 in order to avert complete political chaos in his country. A month later he tendered his resignation as Regent but was persuaded to remain in office.

Damaskinos was born Dimetrios Papandreou in 1891 in Dobritza, in the hill country of Thessaly in Greece. He was one of the thirteen children of a peasant mountaineer family, reports *Time* Magazine, but he is not related to former Premier George Papandreou '44. As a boy, villagers of Dobritza say, he used to range alone over the mountains. During one of these walks he paused before a picture of the Virgin outside a hillside monastery, put his last coin in the offering box, and vowed to become a priest of the Greek Orthodox Church. His uncle, a well-to-do-priest, continues *Time,* sent him to school at Karditza, and there the boy excelled as wrestler and javelin thrower. After his preliminary training, he entered the University of Athens, where he studied both theology and law. During the Balkan War of 1912 he had served as a private in the Greek Army. In 1917 he took holy orders.

The young priest first attracted public attention in 1918, when he was able to settle the nationalist quarrels among the Greek, Serbian, and Bulgarian monks in the monastic community on Mount Athos. In 1922 he was appointed Bishop of Corinth. In 1928 he paid his first visit to the United States in order to raise funds for the alleviation of the distressful conditions which followed the earthquake of that year. Two years later, as Metropolitan (a rank between bishop and archbishop in the Greek Orthodox Church), he again visited the United States, this time in order to mediate the selection of a leader who would satisfy the warring factions of the Greek Orthodox Church in America. Both incidents, notes *Time,* increased his status with the Greek clergy and public.

In 1938 Damaskinos was elected Archbishop of Athens and all Greece by the Holy Synod of the Greek Church. But his majority of only one vote provided Premier John Metaxas, who then ruled Greece with an iron hand, with an excuse to annul the election and appoint Damaskinos' opponent, Bishop Chrysanthos of Trebizond, in his stead. Exiled, Damaskinos sought refuge in a monastery, where much of his time, it is said, was spent, with his pet dog and goat beside him, in learning to play Gregorian chants on a harmonium sent to him by a friend in Chicago. There he remained until the German invasion of Greece, when he was recalled by the Synod to replace Archbishop Chrysanthos, who had refused to swear in the first quisling premier, General George Tsolakoglou.

Far from being docile, Damaskinos fought the Germans with the natural weapons of his office. At one time when he attempted to save a group of hostages chosen to avenge the death of a German soldier, he was asked to name hostages. His response was to substitute a list of his bishops with his own name at the head, and the doomed men were spared. On visits to German military headquarters Damaskinos carried a length of rope to hand to irate Nazis with the words "If you wish to hang me, as the Turks did Gregorios, here is the rope." (This, notes *Time* Magazine, which prints the story, referred to Patriarch Gregorios who was hanged by the Turks before the Patriarchate in Constantinople during the wars of 1821.) By persuading Orthodox Greeks to conceal Jews, the Archibishop was instrumental in saving hundreds of lives. His relief work was widespread and included the organization of soup kitchens and the distribution of clothing and supplies to the poor. Through the EOCHA, or National Organization of Christian Solidarity, which he formed among his clergy, he was able to reach the men of the resistance movement in the hills. But for the wealthy who refused to help their fellow Greeks he had only criticism, and when the Greek quislings attempted to exploit the popular EOCHA he resisted fiercely. Finally, shortly before the liberation, the Nazis placed Damaskinos under house arrest.

With the liberation of Greece by the British in 1944, civil strife broke out between the forces of the Left, the EAM, or National Liberation Front, and the forces of the Government, represented by Premier George Papandreou. Papandreou was suspected of being a tool of the Royalists, who wanted King George II '43 restored to his throne at the earliest possible moment. While the rest of the world watched and Russia objected, British troops reinforced the Greek Government forces, quelling some of the insurgents, but the ELAS, the fighting arm of the EAM, refused to come to terms. Finally, toward the end of 1944, it was suggested that a regency be set up for the time being, with a plebiscite on the question of the return of the king to be held at a later date. When agreement on the first proposal—a three-man council with Damaskinos and a representative of the King as two of its members—was not forthcoming, a round table conference, attended by former Prime Minister Churchill '42 and presided over by the Archbishop, suggested that Damaskinos serve as sole regent until a plebiscite would be feasible. And, on December 31, 1944, after Churchill had persuaded King George II, whose consent was necessary in the unprecedented situation, to accept the solution, Damaskinos was sworn in on his "own sanctity."

At the time the new Regent was characterized as a lifelong liberal whose record showed him to have been habitually friendlier to the Left than to the Right, but it was added that he had "little taste for social revolution and no taste whatever for the brand of international communism that seems to thrive among the ranks of the EAM and ELAS forces," who are said to approve cession of Macedonia to Marshal Tito's '43 Yugoslavia. However, reported A. C. Sedgwick of the New York *Times*, Damaskinos was "considered even in extreme Leftist circles to be a true follower of Christian precepts who is not hostile to the evolutionary advancement of their [the Leftists'] views, although unalterably opposed to efforts to seize the State by violence." It was his opinion, Damaskinos said, that Communist forces were acting on their own in the civil war rather than on orders from Moscow, and that in general in Europe there was no wish for revolution but "a great weariness over strife and endless turmoil." Moreover, he hoped that the coming plebiscite would mean the final unification of Greece. With the populace, correspondents pointed out, the Archbishop had won favor through his courageous opposition to the Nazis.

ARCHBISHOP DAMASKINOS

Despite his popularity, however, observers predicted difficult days ahead for Damaskinos. It had become his responsibility to find a premier who could form a Government uniting all or most of the hostile groups in Greece. "It will not be an easy job," commented Raymond Daniell '43, London correspondent of the New York *Times*. "Eight years of dictatorship in Greece [under Metaxas and later under the Nazis] have not tended to develop leaders untainted with the extreme political views of the Left or the Right." On the fourth day of his regency Damaskinos delegated the work of forming a Cabinet to his new premier, General Nicholas Plastiras, the man who in 1922 had forced the abdication of King Constantine by a military coup. Within two months, although the EAM remained suspicious and hostile to the Government, the Regent had succeeded in disbanding the ELAS. But by early April Plastiras had been dismissed. Well-informed British sources listed as reasons his attempt to impose upon Greece a strong military regime under his direction, his appointment of his former henchmen to important offices, and his

DAMASKINOS, ARCHBISHOP—*Cont.*

inability to handle the Greek economic situation.

This time Damaskinos called upon Admiral Petros Voulgaris, commander of the Greek Navy, to form a Cabinet. His administration is said to have "resulted in a definite amelioration of conditions generally," but it too was dissolved after the Regent returned from the meeting of the Council of Foreign Ministers in London. (Although he was excluded from sessions of the council by the objection of Molotov '40, "he had made his presence felt. . . . [and] dramatized the pivotal position of his country in the new geopolitics of the Mediterranean.") An Associated Press dispatch from Athens on October 9 gave as the reason for the downfall of the Cabinet the refusal of the large Liberal contingent to participate in the general elections scheduled for January 20, 1946, an event later postponed to March 31, 1946. This contingent, together with other Left-wing and Republican groups, had been "campaigning for postponement of the elections on the ground that registration lists were not completed." When eight days later (on October 17, 1945) no political leader had been able to form a Cabinet, the Regent himself took the oath of office as Premier and proceeded to form a Cabinet made up almost entirely of members of the previous one. He had acted, a communique from his office stated, because the political crisis could not be permittted to last any longer and because "the present situation in the country does not permit extemporaneous decisions." He would, he said, assume "personally the presidency of the Government until there was a definite settlement of the Government question on a sound basis." Two weeks later, on November 1, the Regent was able to relinquish the premiership to the "liberal and anti-Fascist" Panayoti Canellopoulos, former Greek Vice-Premier and leader of the Unionist Party, who formed a Cabinet preponderantly Republican but with Socialist leanings.

Like his predecessors in office, however, Canellopoulos failed to solve the economic situation, and on November 20 the formation of a new Government was entrusted to Themistocles Sophoulis. The next day a telegram from King George II, stating his opposition to the proposed postponement of the Greek plebiscite until 1948, precipitated a new crisis when Damaskinos interpreted the message as tantamount to abolishing his mandate as Regent. Fortunately for Greece, say observers, Damaskinos' letter of resignation was delayed and the Archbishop persuaded to remain. He is, wrote Derek Patmore to the *Christian Science Monitor*, "still the only moderating and stable influence in present-day Greek politics."

The Archbishop is a striking figure of a man, a "black-robed giant" standing six feet four inches tall, and towering seven feet in height in the head-dress of his clerical office. "Erect, stoutly built, and black-robed, his pectoral cross glittering on its chain, his pastoral staff pointing the way through argument, the magnificently bearded Archbishop has an overwhelming physical presence which seems to fill the room. Everything about him is very much alive. His Tartar-slanting eyes twinkle behind gold-rimmed glasses." During his visit to Greece Churchill found him "towering up morally as well as physically above the chaotic scene." And Delos Lovelace has written: "Greeks who remember their mythology, passing him on a dark night, might think that the woes of the land have drawn bearded Zeus down again from Olympus."

DAVIDSON, JO Mar. 30, 1883- Sculptor
Address: 80 W. 40th St., New York City; Lahaska, Pa.

Many years before Jo Davidson was called "the dean of United States sculptors," a fellow artist predicted that the time would come when "not to have been done by Davidson was not to have been a great man of the period." Since that time the American sculptor has become internationally known as "a biographer in bronze," whose works are seen in parks, public buildings, and homes all over the world. Envisaging his art as a plastic history of his era, Jo Davidson has gone wherever there was an "interesting head," and he has probably modeled more noted people than any other living sculptor. His Hall of Fame contains such a diversified group that a visitor to his studio in Paris once described it as "a 'pot-pourri' where John D. Rockefeller stood cheek by jowl with Charlie Chaplin '40, and Chaliapin gazed at Mrs. Harry Payne Whitney, while Owen D. Young, Samuel Vauclain and Reggie Vanderbilt clustered around Anatole France."

Accounts of Jo Davidson's early life vary—he himself is not interested in clarifying details, for he feels that chronological data are unimportant; the past, he has told interviewers, has nothing to do with what he is at the present. However, it is known that he was born on the lower East Side of New York City on March 30, 1883, the son of Russian Jewish parents, Jacob S. and Haya (Getzoff) Davidson. As a boy Jo knew the cruelties of poverty, but from childhood he liked to paint and draw, and at fifteen he was studying at the Art Students' League, evidently on a part-scholarship, part-work basis. At nineteen he entered the Yale School of Medicine. Until this time he had never touched clay, but while in New Haven he experimented with modeling at the Yale Art School—and knew immediately what he wanted to do. He abandoned the idea of medical training and left Yale.

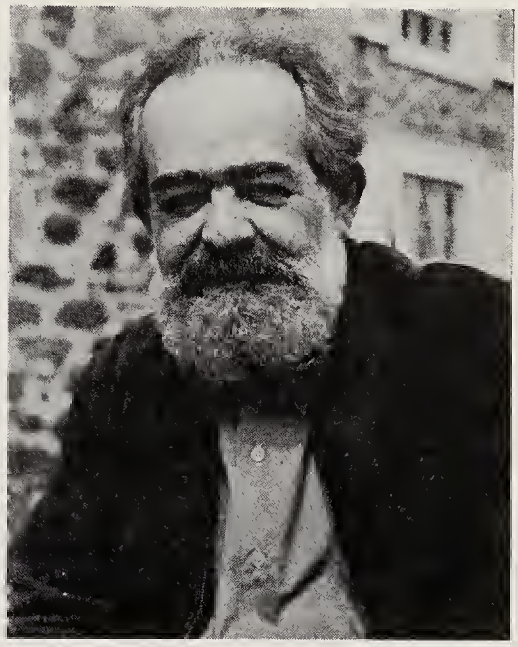
Meanwhile, to earn a living, he had become proficient in pyrography, which Richard Beer in an *Art News* article on Davidson described as "that unhappy art which once spread burnt leather sofa cushions over the land and made it pay." Davidson worked as a foreman in a shop where pyrographic articles were made and, by copying a photograph, he executed a burnt wood portrait of Arthur T. Hadley, then president of Yale. This portrait was purchased from an art dealer's window by W. S. Pardee, a New Haven lawyer, who became interested in the young artist and later encouraged him to go abroad to study.

By 1902, though still eking out his income by selling burnt-wood portraits, young Davidson had committed himself to sculpture and he began working with characteristic determination. From 1902 until 1904 he served as apprentice to Hermon R. MacNeil, who was then working on designs for the "Fountain of Liberty" for the World's Fair in St. Louis. In the beginning the young man earned less than a living wage for the rough work done in MacNeil's studio. In 1904 he spent eight precarious months at the St. Louis fair, living on a "strictly hand-to-mouth basis," but he was twenty-one and resourceful, says Richard Beer, and he sold enough pyrographic work at the fair to pay his way back to New York. There he became a pupil of George de Forest Brush, studied again at the Art Students' League, and at the Educational Alliance, an East Side community center. In 1904 he is said to have done his first striking piece of work, a head of his mother; and in 1905 he received his first commission—from W. S. Pardee, for a statue, *David*, which seems to have aroused no interest, though a later work, *Primitive Music*, gained Davidson some critical recognition. *The Faun*, which he modeled in 1906, was probably the last piece of sculpture that he made during this early American period, although he was drawing for the New York *World* at this time. In 1907 he was in Paris, having won a Hallgarten Scholarship.

Although he made frequent trips back to the United States, and his art-business trips took him to many countries (he even went as far afield as Japan), Jo Davidson lived in Paris from 1907 until the beginning of the Second World War. The early years in Paris were bleak ones: he found it difficult to live on a scholarship of thirty dollars a month, and he was unhappy at l'Ecole des Beaux Arts, and left there after only three weeks. "He appears next," wrote Beer, "on foot, with a knapsack on his back, tramping despondently across France in the direction of Switzerland, accompanied only by a Great Dane named Sultan."

On his return from the walking expedition, Davidson was pulled out of his slump by the artist John Duncan Fergusson and set going again. The sculptor did a bust of this new friend, a piece of work which was said to represent his first break with the conventional. The dog Sultan also proved to be a friend. One night when Davidson was sitting in a cafe in the Boulevard Montparnasse, Sultan wandered off among the tables hoping for some gifts of food. He stopped at the table of a solitary lady who became interested in the dignified animal and in the dark young man who, she learned, was his master. The lady was Gertrude Vanderbilt Whitney '41, and not long afterward she gave the young sculptor his first important commission. In 1909 he exhibited at the Salon d'Automne and had a show of sixteen statuettes at the Baillie Galleries. That winter he returned to New York to hold his first exhibition of work in America, in the basement of a Broadway store. This exhibition was successful, and Davidson was hailed by one critic as "a great impressionistic sculptor." A year later he was given the place of honor at the Paris Salon with his *La Terre*.

Although his work was now becoming known and admired, Davidson had still many years of struggle ahead of him. In 1909 he was married to Yvonne de Kerstat, a Frenchwoman of an old Breton family. Davidson, with a family to support (the couple had two sons), was frank about his desire to receive the highest possible remuneration for his work. Guy Pène DuBois, in his autobiography, *Artists Say the Silliest Things* (1940) tells of working in a Greenwich Village studio just below one which Jo Davidson shared with Salvatore Billotti. ("It was Jo's when he was in New York and Bill's the rest of the time.") DuBois and Davidson would sometimes visit over a bottle and discuss their debts—Davidson's were always the more formidable. But the need for money which drove him on did not interfere with the development of his art, according to writers of the period, but rather matured and broadened it. Davidson's financial situation brightened when, in the years just before the First World War, he left France for England. In the words of one writer, "London fell for him." By 1914 he was showing portrait busts of such notable people as Lord Northcliffe, Rabindranath Tagore, Walter Hines Page, Israel Zangwill, Joseph Conrad, and Havelock Ellis; also included in the exhibition of this now-famous series of busts at the Leicester Galleries in London was a decorative bas-relief panel, which was enthusiastically praised by English critics.



JO DAVIDSON

The First World War years marked a new phase in Davidson's work. Back in France at the outbreak of the war, he posed as a war correspondent and entered the city of Ghent in advance of the British troops. At the peace conference he acted as messenger for a newspaperman. Later he went to Geneva to model the Soviet delegation. In 1916, when he was summoned to the United States to do a bust of President Woodrow Wilson at the White House, the Davidson home in France served as a hospital for French soldiers. In New York that year Davidson exhibited the portraits and drawings which he had made at the Belgian front. The winter after the Armistice he was given the commission of designing portrait busts of all the principal military leaders and peacemakers: Foch, Lloyd George '44, Lan-

DAVIDSON, JO—*Continued*

sing, Clemenceau, Baruch '41, Díaz, Tardieu, Joffre, Venizelos, Pershing, House, Balfour. In 1920 Davidson exhibited these busts, calling the exhibition "A Plastic History of the War."

In 1924 Davidson traveled through Russia, doing a series of busts of Soviet notables. During the late nineteen-twenties he did a portrait in oils of Andrew Mellon, then Secretary of the Treasury; a portrait bust of Mitchell Kennerley, publisher and at that time president of the Anderson Galleries in New York; and a statue of Senator La Follette, which is now in the Hall of Fame at the Capitol in Washington. Although he is generally known as a sculptor of men, Davidson has modeled some notable portraits of women, including Mrs. Whitney, Gertrude Stein, and Mme. Chiang Kai-shek '40.

Jo Davidson at forty-four was a "good-looking, dapper little fellow," according to a *New Yorker* writer who had known the artist in America and visited him in Paris in 1927. The Davidsons had by that time moved from musty Montparnasse to a Norman chalet in Auteuil, a suburb of Paris, and they also had a country home, an old manor house in Touraine. Davidson's wife, as "Yvonne Davidson, Champs Elysées," had become one of the fashionable dressmakers of Paris. The Davidsons had a large circle of friends and were now "cosmopolitans of note," who gave brilliant studio parties.

The writer of the *New Yorker* article quotes a French critic of this period who wrote of Davidson: "The man's art goes deep. There is a kind of primordial strength manifested in all his curves, his planes, and his masses. His work has not only strength and validity; it has the equivalent of color, form, and movement. His is a vital, impassioned utterance in stone, and alive—like himself—at every pore. . . . Yes, you feel the man is putting every ounce of himself into his work." Davidson expressed his own credo of art in this way: "It is a fallacy to set out with the assumption that there is a scale of values in art, 'bad' to 'good.' . . .My sculpture is neither good nor bad; it is mine because I did it, and it expresses something in me. Art is beyond good and evil. Let us say 'for better or worse, this art expresses us.' "

Before 1930 Davidson had finished a colossal bust of Adolf Zukor, which was later transported to the United States where it is now in the Paramount Building in New York City; he had also completed his statue of *The Pioneer Woman* and had modeled Mussolini '42 in Rome. In 1930 he was in London making busts of Frank Swinnerton, John Galsworthy, Bernard Shaw '44, and other "immortals of this day and age." In 1932 the sculptor returned to the United States for the first time in three years, but his subsequent visits were more frequent. On one such trip, in 1934, Mrs. Davidson died.

Greatly in sympathy with the Loyalist cause in the Spanish Civil War, Davidson spent the summer of 1938 visiting the Loyalist battle fronts and interviewing and sketching members of the people's army. Returning to Paris in January 1939, he completed his statue of Walt Whitman; in October, a month after the Nazis had invaded Poland, he flew to the United States to help obtain ambulance units for France and to organize exhibitions of French artists called into service. Unable to return to France, Jo Davidson has since that time made his home in New York and Pennsylvania. All the work which he did in France, "thirty-three years of it," was left in Paris; the French Government sent packers from the Louvre, and sixty cases of his art work were taken to his country place in Touraine for safekeeping.

The Walt Whitman statue which was cast in France and sent to the United States in 1939 represented the fulfillment of one of Davidson's long-cherished dreams. "The Good Gray Poet" has always been a favorite of Davidson's (he can quote many of Whitman's poems), and he used Whitman's "Song of the Open Road" as the motif for the eight-and-a-half-foot statue, which was placed in New York's Bear Mountain State Park after being exhibited at the New York World's Fair.

One of Davidson's most successful "artistic head-hunting expeditions" was a six months' trip to South America in 1941, when he visited ten republics to model the heads of their Presidents. The tour was complicated by politics—in Venezuela, for example, Davidson found the Presidential situation so changeable that he "sculpted" both the outgoing and the incoming Presidents. In Caracas, Venezuela, the sculptor was married to a friend from childhood days, Florence G. Lucius, who is also a sculptor and painter.

Since his repatriation the sculptor has taken an active interest in American politics. A stanch admirer of Franklin Roosevelt '42, Davidson modeled a bust of him in 1933, and designed charm pieces and medallions to commemorate the Roosevelt inaugurations; in 1944 he was one of the organizers of the Independent Voters Committee of the Arts and Sciences for Roosevelt, a group formed by six hundred of the Nation's most prominent actors, musicians, and writers for the purpose of bringing about "united political action by participants in cultural activities." Davidson was temporary chairman of this organization (which came to be known popularly as the "Jo Davidson Committee") throughout its campaign for the re-election of Roosevelt. In September 1944 the committee sponsored a Wallace '40-for-Roosevelt rally in Madison Square Garden. In early 1945 the committee was reorganized under the name of the Independent Citizens Committee of the Arts, Sciences and Professions with Davidson as chairman. (He was given a testimonial dinner in October.) When pianist Hazel Scott '43 was refused the use of Constitution Hall in Washington in October because of her race, Davidson on behalf of his group wired to the D.A.R.: "This indignity . . . is an insult not only to Miss Scott and the Negro people, but to all Americans of every race . . . who believe in the principles of freedom and equality. . . ."

Though he is said to be "downright and opinionated on everything from politics to petticoats," Jo Davidson is also considered a person of broad sympathies and understanding. Since his return to New York he has been active in many groups that have been organized since the beginning of the war, among them the Fund for Jewish Refugees from Germany, the Educational Alliance, France Forever, and Lidice Lives. He is also active in American-Russian groups.

Davidson's *modus operandi* is interesting. His first approach to a new work is to study the subject for the most predominant characteristic; sometimes a miniature in clay is made before work is started on the actual bust. While the subject is posing Davidson entertains him so that the sitter does not feel the strain of posing. Usually a number of sittings are required for a portrait bust, but when necessary Davidson can do one from photographs or sketches, or even from memory. He did President Vargas '40 of Brazil in "six easy sittings," according to *Life* Magazine, and his bust of General de Gaulle '42 was made from sketches done in a ten-minute sitting during the General's short visit to New York in 1944. The cooperation of the sitter is an important factor in modeling; "it takes two to make a bust," the sculptor has pointed out. Some people, too, are more "sculptable" than others. He considers Franklin D. Roosevelt unique among his subjects, for he had no eccentricities. When Davidson modeled Ghandi '42 in London in 1930 the Mahatma dictated to his secretary during the sittings, but the sculptor refused to let Ambassador Dawes smoke his pipe during his sittings. When circumstances require lightning speed the work of modeling is more difficult, but Davidson has carved "grumpy marshals and nervy statesmen" while they worried and worked, orated, and even ate—though here discrimination was necessary, for the expression on the face of a prime minister eating a steak would not be the same as it would be if the gentleman were sitting at his desk weighing the fate of nations!

Although he has a studio in New York to which he goes several days in a week, Davidson does not do much work there because the "tonnage" of his material makes it necessary for him to have ample space and a workroom on the ground floor. In 1940 the Davidsons bought a one-hundred acre farm in Bucks County in Pennsylvania, and this is now their year-round residence. He has built a large studio on the grounds of this country place and does most of his work there, surrounded by his busts, which are lined against the walls "like head-hunters' trophies." Mrs. Davidson, who has both a professional and a wifely interest in her husband's work, says that he "works like mad until he has a thing finished and then never retouches it." She feels that this intensity of work gives his portraits a quality of aliveness that is often lacking in the work of artists who spend hours working on a small surface.

A colorful personality, Jo Davidson has always been good newspaper copy; reporters like to joke with him and draw him out; that cameramen find him photogenic is evidenced by the frequent appearances of his pictures—with his wire-haired terrier or his current portrait bust. Captions under these pictures describe him as "picturesque," "chunky", "booming-voiced," and, almost invariably, "gray-bearded or bush-bearded." A New York *Herald Tribune* reporter once commented on the fact that Davidson, who is always seeking notable heads to model, had himself one of the most interesting heads to be found anywhere: "massive and square with a heavy growth of curling hair, a full beard, smouldering eyes under thick black brows." Friends and critics never cease to be amazed at Jo Davidson's inexhaustible energy and enthusiasm. "He is so enormously vital that he fills to overflowing any studio he works in with his ideas, his energies, himself," wrote one magazine editor. A loquacious talker, Davidson is "apt to plunge at any time into a diatribe against conservatism, Puritanism, or the scholastic." At the time of the 1944 Presidential campaign he was vehement on the question of Roosevelt's continuation in office, saying "In these times of stress, when we are on the threshhold of a new era, it would be disastrous to break the rhythm." Of that epoch Davidson says, "It's the greatest in history. We are going through the birth pains of a new day." He voiced high hopes for the San Francisco United Nations conference, where he went to record the world peace makers in clay.

Davidson's busts have occasionally been criticized for being too impressionistic; Carlyle Burrows, writing in the New York *Herald Tribune*, said at one time that the First World War busts were "like so many postage stamps, struck off in a hurry"; and Leila Mechlin of the Washington *Star*, in describing the busts of the Spanish Loyalists, said that they were "rough externally." But unfavorable criticisms of Jo Davidson's art are seldom heard, praise by far outweighing adverse comments. "Jo Davidson has a Promethean gift for touching cold clay with fire," said *Life* Magazine; his bust of John D. Rockefeller was said to be "contemporary in any age"; he gave "Gertrude Stein's vast proportions a sort of bland, oriental significance." Of his own bust Paderewski said, "It is my truest portrait"; and when Gandhi's portrait bust was shown in London, English critics wrote that it conveyed "the power of quiet resistance," and "'great art' would hardly be too high a praise for it." One writer has called Davidson's life "a fabled story of success." It would seem that Davidson has had few failures; but he did see his scheme for the erection of war memorials in Europe abandoned after the First World War—and still has a sixteen-foot statue of a doughboy, the product of two years' labor, as a relic of that conflict.

Davidson was made a Chevalier of the Legion of Honor in 1925 and was awarded the Maynard Prize of the National Academy of Design in 1934. In 1944 he was elected an Associate of the National Academy of Arts and Letters and a member of the National Academy of Design. The Newspaper Guild of New York selected him in 1945 for one of their Page One awards. Some of his most notable busts are: Dr. Abram Jacobi, in Mt. Sinai Hospital, New York City; John Purroy Mitchell, Columbia University, New York City; Senator Robert M. La Follette, Rotunda of the Capitol, Washington, D.C.; President Woodrow Wilson, Princeton University (presented in 1945). In his New York studio in 1945 were busts of Secretary of Commerce Henry A. Wallace, Helen Keller '42, and Ernie Pyle '41.

DAVIS, JOAN, June 29, 1912- Actress

Address: b. c/o Lever Bros., 450 Seventh Ave., New York City; h. Laurel Canyon, Calif.

Often called the world's funniest woman, Joan Davis is the comedienne whose audiences laugh most loudly at her grimaces, her comic delivery, and her specialty of sitting down hard. She has been in motion pictures since 1937, and in 1941 first appeared on the radio. She has held high place both on the Crossley '41 and Hooper radio polls.

JOAN DAVIS

The only child of LeRoy Davis, a train dispatcher, and Nina Davis, Joan Davis was born Madonna Josephine Davis on June 29, 1912, in St. Paul, Minnesota. Although neither of her parents was connected with the stage, at the early age of three Jo, as she was called, was already singing, dancing, and reciting at various local gatherings. Three years later an unhappy experience started the child on her way professionally. While she was reciting a serious selection at an amateur contest in St. Paul, she was laughed at by the audience. Not one to be easily discouraged, the young entertainer appeared on the program again the following week with a different act. Presenting a comedy routine, she won applause. Vaudeville scouts were impressed with this precocious child, too, and persuaded the Davis family to allow Jo to tour the Pantages Theatre Circuit. Billed as "The Toy Comedienne," she had a fourteen-minute act.

A tutor accompanied the young trouper and her mother on the road, and whenever possible the child was taken back to St. Paul for a few months' schooling. Her parents realized, however, that as their daughter grew older it was better that she attend school regularly. After the completion of a successful tour of the Midwest, Jo therefore returned home to finish her elementary and secondary education. When she was graduated from the Mechanic Arts High School in St. Paul she was valedictorian of her class and a star of the school debating team.

With high school behind her, Miss Davis was now able to devote all her time to her developing career—improving her style and learning new routines. Certain that her métier was comedy, she studied the technique of various stage and screen comedians, concentrating particularly on the clownish antics of Charlie Chaplin '40. As often happens, recognition came the hard way. Miss Davis during her late teens, played almost every vaudeville circuit in the United States, as well as in amusement parks, summer camps, and Elks lodges. For a time she and her manager had been considering the addition of a "straight" man to her act, feeling that he might strengthen it. In March 1931 a young actor named Serenus (Si) Wills, who was also looking for a partner, was introduced to the comedienne, and that month Miss Davis, now "Joan," teamed up with him. Five months later the couple were married. As "Wills and Davis," the team evolved during the next few years into "a smart outfit." Their reward, after several years of barnstorming, was an appearance at the Palace Theatre in New York City, then the goal of all variety artists.

But vaudeville in the mid-'thirties was on the wane. Aware of this, about 1934 the prudent Miss Davis and her husband headed for Hollywood and motion pictures. (Their daughter Beverly had been born in 1933.) In early 1937, on the strength of Miss Davis' performance in a Mack Sennett hillbilly short called *Way Up Thar,* produced a few years earlier, she was given a featured comedy role in an RKO picture. Although that studio was pleased with her, it made no clamor for her services. Then, Twentieth Century-Fox, taking advantage of RKO's disinterest, signed her up for a long-term contract. From 1937 to 1941 she appeared in about twenty-five films for this company. Some of these were: *Thin Ice, You Can't Have Everything, Time Out for Romance, Wake Up and Live* (1937); *Sally, Irene and Mary, My Lucky Star, Hold That Co-Ed* (1938); *Tail Spin, Day-time Wife* (1939); *Manhattan Heartbeat, Free, Blonde and Twenty-one* (1940); *Sun Valley Serenade, For Beauty's Sake* (1941). Describing Miss Davis in her scene on the gridiron in *Hold That Co-Ed,* Kyle Crichton wrote, "Miss Davis makes flying tackles. . . .She takes off into space in an array of limbs and arms resembling nothing other than an octopus taking a flying test, she ends by falling on her caboose with a crash that not only shakes the stadium but shakes the inherent faith of man in the frailty of woman."

Realizing in 1941 that too many pictures are just as bad as too few, the actress secured a release from her studio. Freelancing in pictures for the next three years, Miss Davis appeared in *Yokel Boy* (1942) for Republic, *Sweetheart of the Fleet* (1942) for Columbia, *He's My Guy* (1943) for Universal, and *Around the World* (1943) for RKO. Of Miss Davis' performance in the last film, the *Christian Science Monitor* wrote: "Miss Davis keeps the laughter going in her athletic fashion, diving over the footlights at one point and being bounced out of a jeep at another. She can clown with the best of them in a comic song." In 1944 she signed a contract with RKO calling for two pictures a year over the period 1944-46, and giving her star billing. She also has a similar contract with Universal. Both of these studios allow Miss Davis to make one picture a year with another company. In 1944 her more important pictures were Columbia's *Beautiful But Broke* and Eddie Cantor's '41 production of *Show Business* for RKO. In his review of *Show Business*, Louis Kronenberger '44 of *PM* found that "Miss Davis in her tart, rueful fashion makes the most of her comedy lines." Miss Davis was co-starred with Jack Haley in *George White's Scandals,* a later 1945 release, in which the role of Miss Davis as a child was played by her twelve-year-old daughter Beverly Wills.

In early 1941 Miss Davis made her debut on the radio. Before this first appearance there had been apprehension as to how successful she would be, since her grimaces, pantomime, and angularity would be lost to the listening audience. Miss Davis, also skeptical about her reception. decided to introduce a new feature. On her first radio show she parodied the currently popular novelty ditty "Hey, Daddy," singing the first few lines, then changing to a monologue for the remainder of the song—"It was a new idea and it was good—and so was she." In August of that year she made a guest appearance on the Rudy Vallée program, *Village Store.* Her interpretation of the ballad "My Jim" was so enthusiastically received that Vallée invited her for another guest appearance within a very short time; in 1942 he engaged her as a regular member of the *Village Store.*

When Vallée entered the United States Coast Guard in 1943 Miss Davis took his place on the weekly half-hour show. Radio critics had doubted the comedienne's ability to handle such a responsibility. To their surprise, however, "the show not only survived, it developed." With the help of comedian Jack Haley, Miss Davis' show grew rapidly in popularity. At the end of the year she was voted radio's top comedienne of 1943 in polls conducted by the Scripps-Howard '40 newspapers and the Cleveland *Plain Dealer.* The same year and in 1944 she also won the *Motion Picture Daily*'s Fame Poll, which represented the votes of six hundred radio editors. According to Jack Gaver, as a result of her poll popularity she appeared as guest star on eight big radio programs within one week. The Crossley and Hooper ratings of January 1944 placed her show among the first five most popular programs on the air. By 1945 the comedienne's radio rating had climbed from the 19.7 of the previous year to 26.0, making her the biggest attraction in radio, with the exception of Bob Hope '41 and the team of Fibber McGee '41 and Molly.

In September 1945 she began a program for a new sponsor, with a staff of six top gag writers, one of the largest writing crews of any radio show. Moving from NBC to CBS, she replaced George Burns '40 and Gracie Allen '40 on their Monday night spot. This new contract is said to make Joan Davis the highest paid comedienne in radio. *Newsweek* reported that, weary of her customary man-chasing routine, she would substitute another characterization when she began her new show, but the New York *World-Telegram* reported after the first performance, "You probably won't even detect any difference. . . .We have Miss Davis . . . running a tearoom instead of a general store. . . .Modes in comedy may come and go but Miss Davis remains the good humored lass, uneasy about having so much virtue so long. . . .Blessed with a sense of timing that is nothing short of sublime, Joan Davis remains one of the best comediennes in the business."

Five feet five inches tall, with reddish-brown hair and greenish eyes, Miss Davis is much prettier than she is made to appear on the screen. The comedienne is also considered one of the best-dressed women in Hollywood. Fond of sports, she rides, swims, golfs, and rarely misses seeing a Friday night boxing show at the American Legion Stadium in Hollywood. Always on the lookout for mirth-provoking material, she has a gag file that would fill more than a dozen volumes. And Miss Davis' radio program furnishes enough fun for the whole family—Beverly has played her sister on the show, and her husband is one of the writers of her scripts.

DAVIS, WATSON Apr. 29, 1896- Science editor

Address: b. Science Service, 1719 N St., Washington, D.C.; h. 1422 Rhode Island Ave., Washington, D.C.

"Science means, fundamentally, the ability to tell the true from the false, the effective from the ineffective, that which does work from that which does not. I'm not convinced the world at large is convinced, *emotionally*, that these truths are in fact truth. That's the big job of education." These words of Watson Davis, director of Science Service, express the purpose of his lifework. For the past twenty-five years he has devised methods for popularizing the study of science in general—"from sun, moon and stars to insects, and from the Maya civilization to United States paper money."

Watson Davis, the son of Allan and Maud (Watson) Davis, was born on April 29, 1896, in Washington, D.C., the city in which he was to pursue his vocation. In the Capital he attended George Washington University, from which he received his B.S. in civil engineering in 1918 and his C.E. degree in 1920. During these years the young student-scientist gave evidence of his capacity for diversified activities in his chosen profession. He entered the

Science Service
WATSON DAVIS

Federal service in 1917, as assistant engineer and physicist in the Bureau of Standards, a position which he filled until 1921, while from 1920 to 1922 he was science editor of the Washington *Herald*. In 1921 Davis also became news editor of Science Service, the organization established for the popularization of science, which was founded that year in Washington for the primary purpose of supplying science news daily to the Nation's press. Within another year Science Service began the publication of a weekly *Science News Letter*, and Davis was appointed its editor. He became secretary as well as managing editor of the organization in 1923. A decade later, in 1933, he was appointed director of Science Service, the position he now holds together with the editorship of *News Letter*.

The original purpose of Science Service has been greatly broadened under the guidance of its director. The documentation division, begun in July 1935 (implemented with grants from the Chemical Foundation and conducted with the cooperation of the United States Naval Medical School, Department of Agriculture Library, the Bureau of the Census, Works Progress Administration, Library of Congress and others), was the nucleus of the American Documentation Institute which was organized in Washington in March 1937. Davis, who became president of the new nonprofit corporation, announced that it had been created on behalf of some sixty national scholarly, scientific, and informational organizations "to attempt solution of some of the problems surrounding publication, bibliography, library facilities and other phases of documentation in fields of research, education and learning." He also stated that the institute would encourage, cooperate with, and in some cases operate services for transferring reading matter to microfilm for use in libraries.

A sponsor of science studies for young students, Davis is also director of Science Clubs of America, organized in 1941, another activity of Science Service, and he has done much to develop this plan as "an educational force for the future." In the March 1945 issue of *Education*, he called attention to the fact that already the "150,000 boys and girls in these seven thousand clubs constitute the largest science organization in the world."

A co-project of Science Clubs was organized in 1944 for the purpose of finding jobs which boys and girls could fill while they studied science, a project in which organizations cooperated and thus assisted in lessening the labor shortage: the National Aeronautic Association needed surveys for future airports; the Forest Service needed deputy fire wardens and forest conservationists; the Federal Bureau of Investigation welcomed recruits who, by becoming informed, could offset the wave of juvenile delinquency. As a project for the United States Weather Bureau, boys and girls collect data on rainfall which, when compiled by the United States Weather Bureau, will help solve the mysteries of storms. Clubs have also been asked to study nutrition so they may educate their communities on better food habits.

An annual Science Talent Search is another activity of Science Clubs of America. Of an annual average of thirty-four hundred high school students who complete the requirements of this competition, three hundred are chosen for honorable mention. These students are recommended to colleges, universities, and technical schools for scholarships financed by various organizations. Forty students from this group are selected to go to Washington for five days at the Science Talent Institute, where they attend the lectures by outstanding scientists.

Davis believes that, "if the future belongs to youth and to science, there is a vastly more important place for science clubs in the scheme of things that are to be." He also believes the promise of FM radio offers possibilities for science clubs, in the operation and also in program production of science broadcasts. With the war at an end he is at work on plans for encouraging science activity on a local basis among students as young as ten years as well as in adult hobby groups. He also hopes to expand the number of clubs abroad and to effect the interchange of correspondence and equipment between clubs in United States and those in other lands. The age range for science clubs, he concludes, is "nine to ninety, and that may well give science its greatest educational force in future years." Writing in *School Science and Mathematics* (March 1945), Davis stressed the necessity for human beings "to think straight, to think scientifically, if the world is to be rescued from the plague of intolerance, emotional ignorance, and injustice that afflicts it."

In addition to making addresses before educational and other groups, as well as over the radio, Davis has been a prolific writer with a gift for easy and interesting expression. His first book, *The Story of Copper*, published in 1924, was a nontechnical account of its chemistry, history, and the many uses to which it is put in the world. In 1931 he edited an anthology entitled *Science Today*, which consisted of brief papers originally presented as radio addresses by men of science under the auspices of Science Service. His second anthology, published in 1934 under the title of *The Advance* *of Science,* summarized for the layman the recent findings of research workers in all branches of science. The book received favorable reviews, one of them appearing in *Industrial and Engineering Chemistry*: "We know of no other book of four hundred pages which carries an equal amount of authoritative scientific material in so many different fields." *Science Picture Parade* (1940) is a pictorial presentation of twenty different subjects, among them animals, atoms, electricity, mind, radio, weather. Of it the *Scientific Book Club Review* critic wrote: "Accompanied and preceded by his own [the author's] running comment, the pictures are informative and accurate; some are really beautiful; all are engrossing." Davis' articles in numerous educational and scientific magazines, as well as in Science Service publications, have covered topics such as "Living in a Scientific World", "Creative and Defensive Sciences", "Popularizing Research," and "Flying in the Sub-Arctic."

The scope of this scientist-editor's interest in research is indicated by his membership in the following organizations: American Eugenics Society, Seismological Society of America, Population Society of America, Philosophy Society of Washington, Washington Society of Eugenics, American Society for Testing Materials, American Concrete Institute, British Association for the Advancement of Science, History of Science Society, and Association Française Pour l'Advancement des Sciences. Since 1940 Davis has been a member of the National Inventors Council of the Department of Commerce, and he is also a member of the executive board of the National Child Research Center. He is a Fellow of the American Association for the Advancement of Science, and in 1939 was William L. Hounold lecturer at Knox College (Galesburg, Illinois). Among the scientific expeditions of which he was a member were the eclipse expeditions of the United States Naval Observatory (1925) and Science Service (1932). His clubs are the Cosmos, National Press, Torch, and Harvard. The science editor was married to Helen Augusta Miles on December 6, 1919. Their children are Charlotte and Miles.

DAVISON, F(REDERICK) TRUBEE

(trōō'bĭ) Feb. 7, 1896- Museum administrator

Address: b. American Museum of Natural History, New York City; h. Locust Valley, Long Island, N.Y.

F. Trubee Davison, president of the American Museum of Natural History, was formerly a member of the New York State Assembly and Assistant Secretary of War (for aeronautics) during the Coolidge and Hoover '43 Administrations; and in 1941 he again answered a summons from Washington to take part in the administration of the Army Air Forces during the Second World War, rising to the rank of brigadier general.

Born in New York City on February 7, 1896, Frederick Trubee Davison is the eldest son of Henry Pomeroy Davison, millionaire member of the House of Morgan, and Kate (Trubee) Davison. He received his early education at a public school, where he was elected president of the student body, and he later was graduated from Groton School, where he was senior prefect. From Groton he went to Yale, which he left in his freshman year, in 1915, to drive an ambulance in France. He returned to the university the next year, however, and there organized an ambulance unit which was sent abroad before the United States entered the First World War. Davison remained in New Haven to continue his studies. That year he also organized the Yale Air Unit, for which he raised funds for the purchase of planes and payment of instructors. Peacock Point, the Davison estate at Locust Valley, Long Island, was the site of the unit's first lesson.

When the involvement of the United States in the war seemed inevitable, the members of the Yale Unit enlisted in the Naval Reserve Flying Corps. Davison was commissioned an ensign on March 24, 1917, and promoted to a lieutenant (junior grade) on May 1. He was ordered to active duty three days after his promotion and served as an instructor of aviation at West Palm Beach, Florida, and Huntington, Long Island, until 1918. The Yale Unit went overseas and distinguished itself in battle, but without Davison. During a practice flight his seaplane had crashed into Long Island Sound and he was invalided for months with badly broken legs and a fractured spine. The doctors predicted that he would never walk again without the aid of crutches, but in time Davison was able to discard his crutches for a cane. He was left with only a slight limp, and now walks without any aid. President Wilson awarded him the Navy Cross in 1920 for his services in the establishment of the flight school at Locust Valley. When he was discharged from the Navy a year later he had attained the rank of lieutenant commander.

Davison received his B.A. *honoris causa* and M.A. from Yale in 1918 and entered Columbia Law School the next year; he received his LL.B. in 1922. Then, before he had passed the bar examination, he was elected assemblyman from his district in Republican Nassau County. He served several terms in the State Assembly, where he was a member of a number of committees and chairman of the Committee on Taxation and Retrenchment. He also served on the National Crime Commission, formed under the auspices of Judge Elbert H. Gary to work for the prevention of crimes of violence in the United States. In a tour of the country Davison made a study of criminal legislation which influenced the adoption of the Baumes Laws in New York and similar legislation in other states. (The Baumes Laws are several statutes enacted in 1926 "providing for stricter prosecution and punishment of criminals. Especially well known is the statute providing life imprisonment for those under a fourth conviction for a felony or certain misdemeanors.") Davison was chairman of the National Crime Commission from 1925 to 1936.

Upon his father's death in 1923 Davison inherited the position of trustee of the American Museum of Natural History and more than half of an eight-million-dollar fortune. It is said that Henry Davison left the major portion of his money to his eldest son so as to allow him to engage in a career of public service unhampered by financial cares. In 1926 thirty-

U.S. Army Air Forces

BRIG. GEN. F. TRUBEE DAVISON

three-year-old Davison was called to Washington by President Coolidge to take the position of Assistant Secretary of War in charge of aeronautics, a post he continued to fill during the Hoover Administration. In 1927 he was commissioned a colonel in the Specialist Reserve Corps of the Army. Five years later, in 1932, he ran for the office of lieutenant governor of New York State on the Republican ticket. During the campaign he was considered a rather inept politician when, addressing an American Legion meeting, he called the Bonus Expeditionary Force "unpatriotic." Davison was among those candidates defeated in the overwhelming Democratic victories of that year.

After serving on the Board of Trustees of the American Museum of Natural History for ten years Davison was elected president of the museum in 1933. The board has been described as "the most exclusive club in the United States," membership being limited to those who are descendants of members, or who are prominent scientists or other specialists in similar institutions. Davison took the place of Henry Fairfield Osborn who declared that his successor possessed "in a large measure the qualities of public spirit, of museum-mindedness, of the love of nature, of determination to put things through, of tact, good judgment, of common sense which the museum needs in all its manifold relations." Franklin P. Adams '41 said humorously of Davison's appointment that he was "the only member of President Hoover's Cabinet to be put in a museum." That year Davison received the honorary degree of LL.D. from Syracuse University, and in 1935 he received the same honor from New York University.

The American Museum of Natural History, of which the main functions are education, research, exhibition, and publication, was founded in 1869 by a group of wealthy men, among whom was the elder J. P. Morgan. Inspired by the urging of a young naturalist, Albert Smith Bickmore, and by the theories of Darwin and Huxley which had suddenly given a new interpretation to the origin of life, the group resolved to found a museum that would be the "means of teaching our youth to appreciate the wonderful works of the Creator." Unlike his predecessor, who had been in office for twenty-five years and was both an executive and scientist, Davison acts as an administrator, directing the policies and the finances of the institution. The executive duties are under the jurisdiction of Albert Eide Parr, director of the museum. When Davison first became president he gave the museum's exhibits more publicity than they had ever had before and began to develop its educational program, increasing public attendance by one hundred thousand people during his first year in his unsalaried post. In 1937 Davison started a ten-year development plan which called for an additional ten million dollars in endowments. The museum depends upon New York City for about one-fifth of its funds. The remainder is supplied by the endowment foundation and by the sale of publications and memberships. If there is a loss at the end of the year, the trustees make up the deficit. Since Davison has been in office, membership in the museum has more than doubled. It is visited by approximately 4,500 people each day.

On several occasions Davison himself has added to the institution's exhibits. It was through his friendship with Charles A. Lindbergh '41 that the museum procured the plane in which the famous flier and his wife flew around the world. In 1935 Davison with Mrs. Davison, Martin and Osa Johnson '40, went on an expedition to Africa. In Nairobi, Davison recalls, he had the "most exciting and dangerous two minutes" of his life when an elephant charged at him and he fell into a thorn bush. He fired one shot, but the animal was killed by other members of the party. That expedition succeeded in bringing home a group of five elephants to the museum. Some of Davison's letters to his sons written from Africa were published in the metropolitan press as front-page news.

In June 1941 Colonel Davison was called into active service and assigned to the headquarters of the Army Air Force Combat Command, Bolling Field, D.C. He was acting deputy chief of staff and aide-de-camp to General Delos C. Emmons, his duties consisting of choosing and training civilian and military personnel. In January 1943 he was transferred to the headquarters of the Army Air Forces, in Washington. Two months later he was made chief of the Special Projects Division, a division whose function was to prepare and have in readiness a workable plan for demobilization of the Army. Davison acted as representative for the Army Air Forces on the Interdepartmental Group on Material Demobilization Planning and served on the subcommittee on the disposal of transport aircraft under the Baruch plan. He also represented the Army Air Force on matters concerning contract termination and disposal of surpluses directed by the office of the Under-Secretary of War. Promoted to brigadier general on June 3, 1945, Davison expected to be discharged from the Army in the early part of 1946.

In addition to retaining his trusteeship of the American Museum of Natural History, Davison is a trustee of the New York Zoological Society, the National Recreation Association, and the Institute of Public Administration. He is also a member of the Board of Trustees of the New York Trust Company and the Mutual Life Insurance Company. He belongs to the Yale Club, the American Geographical Society, the American Legion, the Elks, and Masons.

In 1920 Davison was married to Dorothy Peabody, daughter of the late Reverend Endicott Peabody '40, who was headmaster and cofounder of Groton. The Davisons have three sons, Endicott Peabody, Daniel Pomeroy, and Gates. (Another child, Frederick Trubee, is deceased.) Davison has been described as an earnest and effective worker who dislikes writing and avoids interviews. He postpones the preparation of a speech until the last possible moment and rarely expresses himself for publication. A good friend of the late Houdini, Davison loses some of his reticence at private parties when he demonstrates the tricks the magician taught him. While once performing the famous mail-bag trick, he found himself so well locked in that his escape in the manner of Houdini was impossible. In his reading he prefers detective stories and biographies to novels, and although he does not care for bridge, he will play poker for small stakes.

DAWSON, BERTRAND, 1ST VISCOUNT DAWSON OF PENN *See* Dawson of Penn, B.D., 1st Viscount

DAWSON, WILLIAM L(EVI) Apr. 26, 1886- United States Representative from Illinois; lawyer

Address: b. House of Representatives Office Bldg., Washington, D.C.; h. 1345 Franklin St., N.E., Washington, D.C.; 534 E. 42d St., Chicago

The second man of Negro blood to be elected to the United States Congress on the Democratic ticket, and one of the two Negro Representatives in the Seventy-ninth Congress, is William L. Dawson of Chicago, Representative from the First Illinois Congressional District. A successful lawyer, he was elected in 1942, and re-elected in 1944 with six and a half times his original plurality.

Born on April 26, 1886, in Albany, Georgia, William Levi Dawson is the son of Levi and Rebecca (Kendrick) Dawson. More fortunate than most Southern Negroes, he was able to attend the Albany Normal School in that state, and then went on to Fisk University at Nashville, Tennessee. He made an excellent record and was graduated in 1909 with his B.A. *magna cum laude*. Although he was twenty-three at the time, the future Representative had never cast a ballot: his Deep South birthplace denied this constitutional right, through the use of technicalities, to those of Negro blood. In 1912, therefore, Dawson left Georgia for Chicago, some seven hundred miles away, a city second only to New York in the size of its Negro population, and therefore offering unusual opportunities to Negroes with professional training. He studied at Chicago-Kent College of Law and at the Northwestern University School of Law.

WILLIAM L. DAWSON

When the United States entered the First World War in April 1917 William Dawson was thirty-one. Nevertheless, he joined the Army, became a first lieutenant, and went overseas with the American Expeditionary Force, one of two hundred thousand Negroes to do so. Fighting with the 365th Infantry in the famous Meuse-Argonne offensive and in the Vosges Mountains, Lieutenant Dawson was wounded and gassed. On his return as a disabled veteran from the War, he was "greeted in his own country by news of the mobbings and lynchings of black boys because they had come home to the democracy they had helped preserve, wearing the uniform their heroism had glorified" (in the words of Karl E. Downs). (Sixty Negroes and four whites were lynched in the United States in 1918, seventy-six Negroes and seven whites in 1919, and fifty-three Negroes and eight whites in 1920.)

In 1920 Dawson was admitted to the Illinois bar, and began his legal practice in Chicago; two years later, in December 1922, the thirty-six-year-old lawyer was married to Nellie M. Brown. (They have two children, William L., Jr., and Barbara Ann.) It was in 1929 that Chicago first sent a Negro, the distinguished Oscar De Priest, to Congress. He was elected to fill out an unexpired term, and was re-elected in 1930 and 1932. De Priest was a Republican, the traditional political allegiance of American Negroes since the days of Lincoln; but his successor, Arthur W. Mitchell, also the son of former slaves, was the first Democrat of his race to be elected to Congress. (He sat in Congress from 1935 to 1943.) William Dawson was also a Democrat at this time. Although in his native South the all-powerful Democratic Party stood for "white supremacy," Dawson declared he saw liberalism in the national party which nomi-

DAWSON, WILLIAM L.—*Continued*

nated Alfred E. Smith '44 for the Presidency. He became active in local politics, with his eye on an eventual seat in Congress, and was elected State Democratic committeeman from the First Illinois Congressional District in 1930. Before the expiration of his term in this party organization post, he ran for alderman with the backing of Mayor Ed Kelly and was elected to represent Chicago's Second Ward in 1933. After six years in the city council, Alderman Dawson went back into the policy-forming branch of politics as Democratic National committeeman, which elective post he still holds.

In 1942, having won nomination for Representative in the Democratic primary election, Dawson won at the general election, polling 26,280 votes to his Republican opponent's 23,537. On taking the oath of office he said he had entered politics to do his part in "the enhancing of the American Dream [of fair treatment of, and equal rights for, all individuals]." As the only Negro member of Congress, the new Representative was prepared for many trying aspects of his position. On the Democratic side of the House and in party caucuses, he had to sit with Representatives from "white supremacy" states. Nor would a United States Congressman of Negro blood who passed over Jim Crow territory be exempt from the restrictions and discriminations inherited from slavery: Dawson's predecessor had on one occasion been ejected from a Pullman car when it passed through Arkansas. (When the case came before the Supreme Court that body ruled that the action was illegal; if states require separation of the races, they must furnish equal accommodations for all groups.) But Congressman Dawson shrugged off such discourtesy that came his way. "I've got a job to do," he explained, "and I don't want to be distracted from it." This attitude caused the Representative to be denounced by Communists and by those who felt that when prominent Negroes submit to Jim Crow laws they are thereby strengthening the very institutions which humiliate them.

In Congress, Dawson was one of the Roosevelt '42 Administration's most consistent supporters. He did, however, miss a number of votes while in Chicago campaigning for Mayor Kelly's re-election: no vote is recorded for him on repealing the President's order to limit salaries, on liquidating the Home Owners Loan Corporation, on the Hobbs anti-racketeering bill, or on legislation banning subsidies to keep food prices down. He did vote in June 1943 against an increased appropriation for rural electrification. The Chicago Representative used his vote against the Carlson-Ruml '43 plan bill, which "forgave" everybody a full year's taxes to bring them up to a current basis, and for the compromise Robertson-Forand bill in May; also for extending the Reciprocal Trade Agreements Act another two years. In June he voted against the conference income tax bill, which called for a proportionately heavier levy on those with smaller incomes; and against the Smith '41-Connally '41 anti-strike bill, the compromise Smith-Connally-Harness anti-strike bill, and to sustain the veto. He voted in July to sustain the commodity credit bill veto; in September for the Fulbright '43 resolution favoring the participation of the United States in the establishment of appropriate international machinery to establish and maintain a just and lasting peace; and in November against a rider outlawing the Administration's food subsidy program.

In October 1943 Dawson took the stand before the Senate Judiciary Committee to argue for the anti-poll tax bill. Pointing out that in the poll-tax states school expenditures are less than half the national average and the homicide rate is more than three times as high, he stated, "The passage of this bill will restore the right of participation in National Government to those who most need to raise their standard of living." From a constitutional viewpoint, he maintained, the Congress should act under its obligation to guarantee to every state a republican form of government, for in the poll-tax states "the reins of government are in the hands of a small minority which, by virtue of the control of all state government agencies, has entrenched itself in power, and is enabled to perpetuate itself in power by reason of corruption, fraud, and trickery."

During the 1944 session Dawson voted to sustain the President's veto of the tax bill; against the Eastland-Rankin "States' rights" compromise service vote bill; against an investigation of the Montgomery Ward seizure; and against freezing the Social Security tax at 1 per cent, which is said to be an actuarially unsound figure. That November he was reelected to the Seventy-ninth Congress by 42,713 votes to his opponent's 26,204. No longer was he the only Negro Representative—for New York's Harlem had elected the Reverend Adam Clayton Powell, Jr., '42 (Democrat-American Labor Party), who won a seat on the Labor Committee. Dawson himself was assigned by the party caucus to five lesser committees, those on Coinage, Weights, and Measures; Expenditures in the Executive Departments; Insular Affairs; Invalid Pensions; and Irrigation and Reclamation. He began his new term by introducing a bill for the establishment of a permanent Fair Employment Practice Committee to protect the right of every American citizen to employment "according to his knowledge and skill, regardless of race, religion, or national origin." He voted against reconstituting the (Dies '40) Committee to Investigate un-American Activities as a standing committee; no vote is recorded for him on the May '41-Bailey '45 bill to provide for limited national service (nonmilitary) for men from eighteen to forty-five, which came up in February. Later that February he had a chance indirectly to vote for the appointment of Henry Wallace '40 as Secretary of Commerce, when he helped defeat a motion to recommit the George bill (to separate the lending agencies of the RFC from the Commerce Department). This made Wallace's nomination acceptable to Senators who would otherwise have opposed it. In March 1945 Dawson voted for the drafting of nurses into the armed forces; no vote is recorded for him on the compromise manpower bill. On Federal full-employment legislation, he supported a strong bill.

Representative Dawson is a big, well-groomed man, with a thin slanting mustache; his voice is described as soft and musical. He is a thirty-second-degree Mason, an Elk, a member of

Alpha Phi Alpha, the American Legion, and the Disabled American Veterans. A 1943 visitor to his office found bookend figures of Lincoln on his desk, and a photograph of Vice-President Henry Wallace in the place of honor on the wall. The Representative sees his own particular mission as winning friends and developing understanding for his own group and for all underprivileged groups. Their particular grievances, he feels, "fade into insignificance in the light of the bigger questions raised by the war. America's enemies now are the foes of all minorities. There is no aristocracy in death."

DEMPSEY, JACK June 24, 1895- Restaurateur; former heavyweight boxing champion

Address: b. Jack Dempsey Restaurant, 1619 Broadway, New York City

The spotlight of public attention which is focused upon champions in the sports world usually shifts quickly to the new idols who supplant them. With few exceptions champions are retired into oblivion once they pass the peak of their performance. One of the exceptions is Jack Dempsey, for whom clamorous applause has subsided into quiet admiration. The heavyweight boxing champion of the world from 1919 to 1926, he is credited with "bringing boxing out of the small, smoke-filled clubs into the spacious arenas." Now a successful restaurateur in New York City, during the Second World War he was Commander Dempsey of the United States Coast Guard. But by old and young sports fans he is still called "The Champ."

JACK DEMPSEY

William Harrison Dempsey, who took the name of Jack when he was twenty years old, was born June 24, 1895, of Indian, Irish, and Scottish ancestry. He was one of eleven children. When he was very young his parents, who were sharecroppers, made an effort to improve their lot by moving from his birthplace, Manassa, Colorado, to Utah. The boy went to the village school, where he showed little aptitude for learning, but excelled in competitive games: he would, for example, borrow boxing gloves which belonged to an older prize-fighting brother and box with classmates after school hours. His schooling, however, was not to continue beyond the eighth grade, for he then began to shift for himself by working at any job he could get—fruit picking, lumbering, or mining. He also found jobs in pool halls and shooting galleries, where, it is said, his practice in gauging an opponent's skill laid the foundation for his success as a boxer—a keenness in "sizing up the other fellow."

Determined to become a fighter, Dempsey trained tirelessly until punching and blocking became second nature with him. He saturated his hands, face, and neck with brine to toughen the skin. He practiced holding low-crouch positions to foil the punches of an opponent, and chewed gum incessantly to strengthen his jaw muscles and thus prevent a point-of-the-chin knockout. It was at this time that Dempsey changed his two prenames to Jack, his name thus becoming the same as that of the famous middleweight champion, Jack Dempsey, of the early 'nineties. (Young Dempsey's older brother had also been known by that name in his boxing days.) Fortified with a new name and a trained body, Jack Dempsey launched his fighting career. In two years—1915 and 1916—he knocked out practically every opponent he met, but he failed to gain recognition.

In 1917, when Dempsey was twenty-two, the turning point in his career came with the appearance of Jack Kearns, a fight manager. The promoter, appreciating the young fighter's pugilistic powers, teamed up with the promising boxer and set about to secure strong opponents that would develop Dempsey into championship material. The young boxer, just a little over six feet tall and weighing about one hundred and eighty pounds, fought such boxers

DEMPSEY, JACK—*Continued*

as Homer Smith, whom he downed in one round; Carl Morris, six feet four inches tall and weighing 235 pounds, whom he also knocked out in one round; and Fred Fulton, six feet five and one-half inches tall, whom he defeated in eighteen seconds. Newspapers began dubbing Dempsey "Manassa Mauler" and 'Jack the Giant-Killer." By early 1919, when Dempsey's boxing record showed a score of victories and only one defeat in almost two years, the boxing world agreed that this hard fighter was headed for the heavyweight pugilist crown.

On the sultry Fourth of July of 1919, in Toledo, twenty-four-year-old Jack Dempsey reached the goal of every aspiring boxer—he won the world championship. The young fighter's adversary was Jess Willard, a huge man towering six inches over Dempsey's head and weighing about seventy pounds more. The fight was still in its early stage when Dempsey, standing on his toes to compensate for his shorter stature, drove his powerful right hand against Willard's midriff and his lethal left hand against his opponent's cheek bone, splintering it into thirteen pieces. Dempsey kept hammering away, until the seventh knockdown: Then Willard, exhausted and badly mauled, remained on the canvas after the count of ten, and Dempsey was pronounced the victor. However, a few seconds later the timekeeper announced that the round had ended before the count of ten, that the shouts of the crowd had drowned the clang of the bell. Dempsey returned to the ring, "finished the job" on Willard in the fourth round, and was crowned the new champion heavyweight of the world.

Even with his new title, however, Dempsey was described as not a completely happy man. The consuming concentration of his youth on becoming king of the ring had crowded out all other thoughts, depriving him of an appreciation of the many other interests of a rounded life. The limited schooling he had had, his rough exterior, and an inability to win personal popularity made him ill at ease with people. In addition, he was charged with draft evasion during the First World War while working in a shipyard. Although the court used his case as a test and acquitted him, there was still some criticism. Then Dempsey, who had little inclination for reading, began his program of self-education by observation and conversation. He became less shy and more interested in meeting people, and a transition set in. Dempsey began to win the regard and friendship of those who had previously shunned him.

Jack Dempsey's title was challenged six times in the seven years he was champion. In his match with Bill Brennan, the second bout for Dempsey's title, it took the champion twelve rounds to knock out his opponent. In the next title bout, the first million-dollar-gate fight in the history of the ring, the Manassa Mauler knocked out Georges Carpentier in the fourth round in Jersey City. In the two fights for the title in 1923 Dempsey no longer demonstrated quite the form that had rocketed him to the championship in 1919. It took him fifteen rounds to win by decision his combat with Tommy Gibbons, and on September 14 of the same year the "champ" fought his fiercest ring battle to retain his title. His opponent, Luis Firpo, an Argentinean topping the champion's weight by twenty-five pounds, proved a most formidable ring enemy. In the first three minutes and fifty-seven seconds of a fight which brought forth pugilistic tactics in their most savage form, Dempsey hit the canvas twice, and the South American was floored ten times. After being knocked down by the impact of Firpo's powerful right, Dempsey came up fighting, although striking away in vain at Firpo. Dempsey himself has described this fight in New York City: "I never saw a man who could hit so hard and so fast at the same time." Just before the end of the first round Firpo's fearsome right catapulted the champion out of the ring, head first. Dragging himself to his feet, Dempsey, seemingly "through," leaped into the second round like a tiger and, with a powerful left synchronized with a right across, sent Luis Firpo down into defeat. The championship title was still Dempsey's.

On September 23, 1926, over one hundred thousand spectators (a number unparalleled at any other fight) came to Philadelphia to witness the Jack Dempsey-Gene Tunney match—the fight which dethroned the champion. "Jack the Giant-Killer was no longer an apt description of Dempsey. Loss of form after three years of comparative inactivity, coupled with the fact that Kearns was harassing him with law suits, had reduced Dempsey's fighting skill, spirit, and ferocity. Dempsey was outboxed and, by decision, Tunney was declared the new champion heavyweight in the tenth round. Undaunted and reconditioned, a year later the ex-champion fought Tunney again in an attempt to retrieve his title. The seventh round of this Chicago bout is famous for the dramatic long-count which will probably pass down to posterity as a subject of much controversy in the boxing world. In this round Dempsey knocked down Tunney but was so befogged with fatigue that he failed to rush to the neutral corner as he was expected to do. Instead, Dempsey stood limply over the recumbent Tunney for about four seconds before he collected his faculties and retired to the neutral spot. Only then did the referee begin to count. Dempsey fans contend that his fighting time for the round was shortened so that he did not have an opportunity to inflict a final knockout in that round. After ten rounds, with Dempsey badly mauled, Tunney was named the victor. Commenting recently on the long-count, the ex-champion remarked: "The referee was not responsible; Tunney was not responsible. I should have been in the neutral corner." Dempsey feels the long-count was a stroke of good fortune for him. Had he regained the championship, the next title bout would have resulted in a more intense "shellacking" than the one he sustained in his 1927 encounter with Tunney.

During 1929 and 1930, when not busy with his numerous business enterprises, Dempsey refereed fights, announced matches, and advised aspiring young boxers. In 1931, when the depression made deep inroads into Dempsey's savings, the ex-fighter decided to re-enter the ring. At the age of thirty-six he began a vigorous workout to tone up his body, but found he could not live up to the regimen. Notwithstanding, he fought fifty-six exhibition bouts and gradually got himself into shape. However, a weakness resulting from a case of influenza contracted while on the boxing tour persisted throughout his attempted comeback period. In his fight with King Levinsky in Chicago in February 1932 Dempsey realized that the time to doff his boxing gloves had come. The ex-champ says, "It wasn't Levinsky who made me realize it; it was Old Man Time." Speaking from his own experience, Dempsey now says that champions should refrain from attempting comebacks because they usually are "punch-drunk" (not physically fit for the ring) and are inviting ring disasters.

During his years in the ring Dempsey fought sixty-nine professional bouts. Of these he won forty-seven by knockouts, seven by decisions, and one on a foul; he drew four, there was no decision in five, he lost four decisions, and was knocked out once. Over this period, according to his business manager, the fighter earned about five million dollars.

In evaluating the ex-champion's hitting power, some sports writers have referred to him as "the most powerful hitter of all time." Dempsey disagrees with that opinion. "It's *when* you hit the man that counts, not just how hard," he asserts. Dempsey's conviction is that once a fighter is in the ring he has to fight for all he's worth, every inch of the way. "That's what fans pay to see. . . .That's what makes fighting a good game. Take it easy and you let everybody down." When asked once by a heavyweight prospect how to become the world's champion, Dempsey simply said: "Keep your guard up, your chin down, and your seat off the canvas." According to Gene Tunney, the man who wrested the title from the Manassa Mauler, "Dempsey is the greatest fighter that ever lived."

After 1932 Dempsey continued with his referee work but devoted the major part of his time to his business interests. He became the proprietor of a clothing store, bought a large liquor house, purchased real estate in the form of hotels in Miami and Los Angeles, and opened two restaurants in New York City. The mural in one of these restaurants depicts a scene from the fight that gave Dempsey the championship title. In 1941, just before the entrance of the United States into the Second World War, Dempsey assumed a major job in the "Hale America" program. Appointed Deputy Director of Physical Training for Boxing under the Federal physical training program for civilian defense, Dempsey was responsible for conditioning boxers and getting a physical fitness message to the people of the United States. Said the assistant director of this program: "Not only is Jack a living example of health and physical perfection, but he stands unchallenged as a popular hero."

After Pearl Harbor, in early 1942, Dempsey tried to enlist in the American Army. Although in perfect condition, he was rejected because he was over-age and lacked military experience. He then joined the Coast Guard as director of its physical fitness program. With the rank of commander, he was a Coast Guard instructor and morale officer at Sheepshead Bay, New York. In July 1945 he was assigned to the Central Pacific as morale officer and went on a three months' flying tour of the various combat areas from Pearl Harbor to Australia to see what athletic and recreational training and equipment was needed. Dempsey says his greatest thrill of the whole trip came just before landing with the assault troops on Okinawa. The boys, jittery and worried, relaxed when they saw the former champion and decided, "This can't be so tough if they send old men like Dempsey along with us."

Ending his Coast Guard service at the end of November 1945 with a Victory Bond tour, civilian Dempsey announced that he was signing a contract to head a newly formed fight promotion company at a salary of two hundred and fifty thousand dollars a year, for ten years. The company, he said, was the product of a large advertising concern and would promote prize fights in the United States and abroad. It would specialize in selling to advertisers the television rights to the fights.

Tall, heavily built, his soft eyes described as tiger-like when he was fighting, Jack Dempsey is known for his cheerful disposition and boundless energy. He comes in contact with countless people every day, when his keen faculty for remembering names and faces shows itself. He is also known for his generosity—he is said never to refuse a request from his friends for financial help. His second marriage, to the motion picture actress Estelle Taylor, ended in divorce, and in 1933 he was married to Hannah Williams, the singer. Divorced from her in 1943, he was given the custody of their two children, Joan Hannah and Barbara. His contentment with life nearly twenty years after he ceased being a world champion is expressed in his own words: "The best job I ever had was being champion. The next best is what I have now, being ex-champion."

DEMPSEY, WILLIAM HARRISON *See* Dempsey, J.

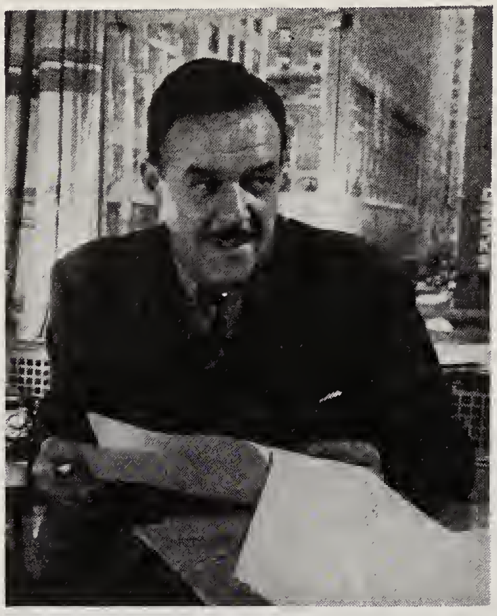
DE ROCHEMONT, RICHARD (GUERTIS) (dĕ-rôsh'mŏnt gâr'tĭs) Dec. 13, 1903-

Newsreel producer

Address: b. March of Time, 369 Lexington Ave., New York City

Richard de Rochemont is the producer of the March of Time documentary films which, in the United States, each month reach an audience of thirty million persons in nine thousand theaters.

Descendant of a Huguenot family forced to flee France in 1685 after the revocation of the Edict of Nantes, Richard Guertis de Rochemont was born on December 13, 1903, to Louis L. G. and Sarah Wilson (Miller) de Rochemont. A native of Massachusetts, having been born in Chelsea, he was educated in that state, at the Cambridge Latin School, Williams College, and Harvard University. From Harvard, which he attended during the year 1920-21 and from 1924 to 1928, De Rochemont received his bachelor's degree *cum laude* in 1928. While at Harvard he married Helen Bogart, a student from Simmons College, set up housekeeping, and secured a job as reporter on the Boston *Daily Advertiser*. This made the finding of time for study somewhat of a problem un-



RICHARD DE ROCHEMONT

til he read that the first two hours of sleep were more beneficial than all the succeeding four and his "obliging city editor" permitted him to choose his own hours provided they totaled forty-eight in the week. This arrangement permitted him to snatch his sleep in two hour shifts without disturbing the remainder of his schedule.

After commencement, De Rochemont and his wife sailed for a vacation in Paris financed by a relative. When they returned to the United States De Rochement was hired by the New York *American.* For a time life proceeded smoothly and uneventfully until an executive remembered an article on tabloids which De Rochemont had written for the *American Mercury,* and the young man lost his job. Following a period (in 1929) in which he reported for the New York *Sun,* De Rochemont in 1930 began working for Fox-Movietone News of New York. In 1931, with only an inadequate command of high school French, he was transferred to Paris as editor of the French edition of the Fox-Movietone newsreels. This meant learning to speak French or quitting. The result was that De Rochemont learned enough of the language to occasion a friend's comment that he had the accent while De Rochemont had the vocabulary. Before De Rochemont resigned in 1934 he had risen to the position of director of the Actualities Fox Movietone.

In 1934, shortly after its establishment as a new production unit by Time, Inc., De Rochemont joined the March of Time as European manager. Shuttling back and forth between his Paris and London offices, he supervised during the next five years such March of Time features as *Croix de Feu, League of Nations, Revolt in France, The Maginot Line,* and *Crisis in the Mediterranean.* He was able to obtain the first newsreels ever made of the Paris executioner, Anatole Dieble, and of Sir Basil Zaharoff, the munitions mogul. For a film on the French grape and wine industry he was awarded the civilian decoration Chevalier du Merite Agricole in 1938. Always he was "fiercely anti-Nazi." Always his principle of operations was "that truth makes the hardest anvil." The documentary approach to him was "essentially the hard-boiled approach." "Too many of the Hollywood efforts in that field," he asserts, "haven't had that attitude at the core. You've got to face facts."

But the events which finally forced De Rochemont home to the United States were already darkening Europe during the last prewar years, and an attempt to make a film about Poland gave him a foretaste of what was to come. He had found the Polish Government enthusiastic over the project and eager to cooperate. But when he attempted to get the necessary credentials to facilitate his group's progress through the country, he was told that there might be "some difficulty in getting proper credentials" for two of the men—Jews whom he had hired in Poland. Dramatically, it was in Warsaw that he learned of the opening of hostilities when a transatlantic telephone call from his brother Louis reached him with the information that Germany had invaded Poland that morning. With the Nazi invasion of France he was forced to evacuate the Parisian March of Time offices, first to Pont-Levoy and eventually to Bordeaux. At the same time, in 1939-40, he doubled as an accredited war correspondent with the French Army for *Life.* When Otto Dietrich, the German propaganda minister for France, arrived at De Rochemont's abandoned Paris quarters shortly after the capitulation, the producer, his wife and their dog were on their way to Lisbon "in a car so loaded with luggage that it was riding on the axle." "I see De Rochemont had the good sense to get out in time," Dietrich is said to have remarked.

Back in the United States, De Rochemont became managing editor of the main branch of the March of Time, of which his brother Louis was then producer and director. There followed a period in which he assumed increasing administrative responsibility because of his brother's ill health, and in 1943, when Louis departed for Hollywood, Richard de Rochemont was appointed producer. Asked at that time whether he contemplated any changes in policy, he replied: "I am not a reform administration, if that's what you mean. March of Time is a pretty well established institution and I have a good deal of respect for institutions—that is, as long as they behave themselves." During De Rochemont's tenure as editor-producer, the March of Time has filmed such highly praised reels as *Underground Report, What To Do With Germany, Report on Italy,* and *The New U.S. Frontier.* Under his direction it produced in 1941 *The Story of the Vatican* (released through RKO), the first officially sanctioned motion picture of the Papal State.

His concern for some time has been with the orientation of March of Time films in a postwar world; hence 1944 saw him concentrating on postwar themes such as the employment problem and in *Sweden Takes the Middle Road* dealing with a topic "that is at once international, contemporary, and has bearing on the future." A 1945 *March of Time* was *Palestine Problem,* an account of what the Jews had done toward establishing a homeland in Palestine. Envisioning an early and good market for his films in Europe, De Rochemont hopes to produce documentaries which, as New York *Times* interviewer Theodore Strauss phrases it, "see America in terms of the international horizons which have closed in upon it" and "see the international scene as an enlightened American would see it."

When not concerned with the March of Time, De Rochemont's thoughts are apt to turn to France, a country for which he has "acquired a terrific admiration." For several months in 1941—when he slipped into unoccupied France and came back with a strong indictment of the Vichy Government—and after the liberation in 1944, De Rochemont was again war correspondent in France for *Life* and the March of Time. A former vice-president of the French-American Club, he is now national president of France Forever, the Fighting French Committee in the United States, associated with the French Provisional Government of De Gaulle '40. On his first visit to France after V-E Day De Rochemont was decorated as an Officer of the Legion of Honor in recognition of his services to France. What he thinks of France and the French can be found in his articles in *Life* and the *Reader's Digest* and is summed up in his statement: "All the headaches I've had from them have never shaken my conviction that fundamentally we [France and the United States] get along. The French and the Americans share the same faults and the same virtues. I'd like to see France get back into business as a practicing democracy."

The March of Time producer is six feet in height, and his hair and eyes are brown. Called by Strauss of the *Times* "a hard-headed liberal with an ardent belief in the sanctity of the facts . . . [and] an instinctive distrust of conclusions based on anything else," he is said to have "a reporter's traditional inquisitiveness and . . . equally traditional skepticism." During the week he lives in a small apartment in New York City, but his real home, "where his wife is in charge of practical supervision," is the "strictly utilitarian" farmhouse "without a single panel of pine" on his seventy-acre farm at Flemington, New Jersey. He is fond of the movies but says he does not attend as often as he should. Somewhat of an amateur musician, he plays, by ear, a clarinet and an old valve trombone, both of which he picked up in Paris, but "strictly for home consumption and lease-breaking." Reading for the producer consists of material concerning his work, politics, and farming. "My wife reads the Government manuals and I read the theory," he says. "Then we fight about them and she wins."

DICKINSON, MRS. LAFELL Aug. 28, 1882- Clubwoman

Address: b. General Federation of Women's Clubs, 1734 N St., N.W., Washington, D.C.; h. 60 Roxbury St., Keene, N. H.

One of the oldest and largest women's organizations in the United States, the General Federation of Women's Clubs, is headed by Mrs. LaFell Dickinson (Lucy Jennings Dickinson), of Keene, New Hampshire. The executive began club work with her local group, broadening her activities through the years to become president of the Federation in 1944. A former business woman, the New England club leader has devoted herself to organization work for about twenty years.

Lucy Jennings was born in Winchester, New Hampshire, on August 28, 1882, to Willard Harvey and Jane (Buffum) Jennings, a descendant of the early settlers. She attended Oak Grove School in Amhurst, Massachusetts, and Brattleboro High School in Vermont. Then, following a family tradition, she entered Mount Holyoke College in South Hadley, Massachusetts, from which she received her B.A. degree in 1905. When her father died a few years afterward Lucy Jennings undertook the management of his lumber business. She also became a director of the Winchester National Bank, the first woman to serve there in that capacity. In the course of her business career, which had begun in 1907, she met LaFell Dickinson, and, she says, "I married my best customer."

After her marriage on October 28, 1911, Mrs. Dickinson retired from business. Later she became interested in club work, and by 1924 was president of the Keene Woman's Club, a position she held for two years. The mother of two children, Jane and Lucy, Mrs: Dickinson was also active in the Parent-Teacher Association movement, serving as State vice-president from 1928 to 1930. About the same time she rose to the presidency of the New Hampshire Federation of Women's Clubs (1929-31). In 1935 she became treasurer of the General Federation of Women's Clubs for a three-year period. Then, in 1941, the New Hampshire woman took over the post of first vice-president in the organization, a position which was followed by her election to the presidency in April 1944 for a three-year term. In assuming this office Mrs. Dickinson became the first president in the long history of the influential organization to come from a small town.

Founded in 1890, the General Federation of Women's Clubs consists of 16,500 clubs throughout the United States and in thirty foreign countries, with a membership of two and a half million. In 1930 its financial resources were more than $236,000. A nonpolitical, nonsectarian organization, it was one of the earliest groups to enter "the arena of political pressure." According to a study appearing in the *Annals of the American Academy of Political and Social Science* in May 1935, it is a potent molder of public opinion. In its many years of civic service, the Federation has worked on projects covering such fields as conservation, civil service reform, education, and world peace. According to its Constitution, "the object of the General Federation shall be to unite the

Underwood & Underwood

MRS. LAFELL DICKINSON

women's clubs and like organizations throughout the world for the purpose of mutual benefit, and for the promotion of their common interest in education, philanthropy, public welfare, moral values, civics and fine arts."

Mrs. Dickinson's program as president of the Federation has as its theme "Home as the Hub of World Affairs," building upon consultation, cooperation, kindness, and tolerance. Under her leadership a Post-War Planning Department had been created in the Federation even while the membership was actively engaged in war service. In a special war bond campaign during June 1944-June 1945 Federation members sold more than one hundred and fifty million dollars worth of bonds. The organization also conducted recruitment campaigns for the women's wartime auxiliary services as well as the United States Nurses Cadet Corps, and the Women's Land Army; it also made wide distribution of educational literature on all existing and proposed international organizations.

During a three-day meeting of the board of directors in October 1944 the Federation planned a broad youth program. Launching a national drive for postwar planning for the youth of the Nation, including coordination of all public and private resources, Mrs. Dickinson declared, "This is the most important thing we've ever undertaken." All of the units of the Federation were urged to enter actively into the youth campaign, which will be the organization's chief project for the next five or ten years. In April 1945 the Federation chief called a meeting of fifteen organization leaders to discuss the program and attempt to set up a clearing house, an agency for the integration of activities. Mrs. Dickinson pointed out that the aim was not to focus on juvenile delinquency but on aid to youth in the areas of education, health, and employment. In the early summer of that year she and Judge Anna M. Kross '45, chairman of the Federation's youth conservation committee, conferred with Eleanor Roosevelt '40 on the subject. Soon afterward Mrs. Roosevelt wrote in her column: "I look with great hope on the interest of the Federation of Women's Clubs, which represents such a vast number of women throughout the country."

At the board of directors meeting in October 1944 a resolution was passed endorsing a proposed constitutional amendment providing for ratification of treaties by a majority of both houses of Congress. Another recommendation called for the training of psychiatric personnel as part of the national program for the demobilization of veterans. Early the following year the Federation joined other women's organizations in planning a reconversion blueprint for women in the state of Indiana. This project won the full approval of Frieda Miller '45, director of the Women's Bureau of the Labor Department, who indicated that women's groups "may well work together to develop a program dealing with the problems arising out of this extended wartime problem of women getting into new jobs." In March Mrs. Dickinson met with several other national women leaders to discuss the role of women in the postwar world. She stressed the need for action to get women appointed to policy-making positions, urging that public officers be reminded of the many women qualified for such positions. In April 1945 Mrs. Dickinson was named a consultant to the United States delegation to the United Nations Conference on International Organization in San Francisco. Upon her return from the West Coast she commented on the "immediate and friendly footing" on which North American and South American women came together at the conference. That same year the Federation supported the proposal for an international guaranty of human rights, and its president urged all clubs to send messages to this effect to the State Department. In August Mrs. Dickinson took part in a radio program in connection with the twenty-fifth anniversary of the Nineteenth Amendment, which gave the ballot to women. Another anniversary in which she took part was the November observance of the twenty-fifth birthday of radio, when she spoke of the challenge confronting it in winning the peace. With two other clubwomen, Mrs. Dickinson appeared that same month before the House Military Affairs Committee to speak of the controversial issue of universal military training. While she made it clear that she did not speak for her organization, she stated that she reflected the stand of thousands of American women in their support of draft in peacetime. The directors of the Federation seconded this stand in December by endorsing President Truman's '45 request for military training.

Mrs. Dickinson's wide organizational affiliations include membership in the American Association of University Women, the National Federation of Business and Professional Women's Clubs, and the League of Women Voters, of which she was the New Hampshire branch director in 1930. The New Englander belongs to the Daughters of the American Revolution, Daughters of Colonial Wars, and Colonial Dames. She also serves as a director of her state's Tuberculosis Society and Children's Aid and Protection Society. A member of the

Garden Club of America, Mrs. Dickinson is a fern enthusiast, her fernery containing more than fifty-some varieties from many states. In addition to gardening for recreation, she also likes to play contract bridge. The clubwoman is considered a good speaker and has addressed national and state meetings of clubs and other groups. A regular contributor to the organization's monthly publication, *General Federation Clubwoman,* she has also written for other magazines.

Lucy Jennings Dickinson is described as a plump woman, five feet five inches tall, with gray hair and brown eyes. A person of tact and "vast mental and physical vigor," she is said to have a lively sense of humor. The Dickinsons' fifteen-room summer home is located in Swanzey, not far from their permanent residence in Keene. The clubwoman commutes from her office in Washington to spend weekends with her family in New Hampshire. Her husband, president of the New England Box Company, is credited by Mrs. Dickinson with a large share of her success in club work, for, she has said, "At many points I should have given up if it had not been for his unfailing support." The Federation chief firmly believes there is a place for women in public life, intending herself to enter politics when her Federation term is ended. While she is enrolled as a Republican, Mrs. Dickinson states that she "votes for the best man regardless of party." Of her future political plans she says, "I shall start as a small-town politician just as I started as a small-town clubwoman."

DICKINSON, LUCY JENNINGS *See* Dickinson, Mrs. L.

DOBBIE, SIR WILLIAM (GEORGE SHEDDEN) (dŏ'bĭ) July 12, 1879- British Army officer (retired); writer; lecturer
Address: Bailey's Hotel, London

In 1943, when the Reverend Daniel A. Poling '43 ended a survey of armed services chaplains, he wrote of the high-ranking officers whom he had met: "Never before in any comparable area have I found so many ranking executives giving so much attention to religion." Typical and outstanding among these "sword and Bible" generals of the Second World War is Sir William Dobbie, who was called from retirement to become the hero of Malta, one of the most heavily bombed spots in the world and the island which "conceivably . . . saved the war." Dobbie, who is now again on the retired list, in 1945 made a lecture tour in America in which he brought home vividly to his audiences his sense of God's aid in the Battle of Malta.

William George Shedden Dobbie seemed destined at his birth for a military career. On the Dobbie side of the family he is of Crusader stock. Only his father, W. H. Dobbie, had broken with tradition, taking a post in the Indian Civil Service. Hence, it was in Madras that William was born in 1879. When he was only nine months old, his parents left him with relatives in England so that he might receive an education in keeping with his family's station. At Charterhouse, "one of the best of England's special preparatory schools," he became a top-ranking classical scholar and a keen student of ancient military campaigns. Upon completion of the course, by competitive examinations he proved qualified to continue his military career at the Royal Military Academy at Woolwich, from which, in due course, he went to the School of Military Engineering at Chatham. In 1899, at the age of twenty, he was commissioned a second lieutenant in the Royal Engineers. Dobbie first saw service in the Boer War in 1901 and 1902, winning the rare honor of the Queen's Medal with five clasps, indicating further awards. Thereafter, he was stationed for a time in Bermuda and later served in Ireland. In 1911 he entered the Staff College at Camberley for further training, and was graduated two years later. (In 1904 he had been married to Sybil Orde-Browne, youngest daughter of Captain Orde-Browne of the Royal Artillery. They are the parents of one daughter, who was with them on Malta, and of two sons who served in the British Army; they also have a grandson.)

British Official Photo.
GENERAL SIR WILLIAM DOBBIE

During the First World War Dobbie served in France and Belgium, rising to the rank of brevet lieutenant colonel and becoming General Staff Officer No. 1 under Field Marshal Sir Douglas Haig. It was in this capacity that he acquired the distinction of composing, and issuing under his own signature, the "cease-firing" telegram of November 11, 1918: "Hostilities will cease at 11:00 hours today. Troops will stand fast at the line reached at that hour. There will be no fraternization with the enemy." When asked what he did in that war, Dobbie now answers that he ended it. Dobbie was also the officer who signed the order for the British occupation of Germany. *Life* reports that "he has since carried with him the originals of those two epochal orders." During those four years in battle Dobbie was the recipient of

DOBBIE, SIR WILLIAM—*Continued*

many honors: the Mons ribbon, the Croix de Guerre from Belgium, the Croix de Guerre with Palms from France. He was made Officer of the Order of Leopold by Belgium and was awarded the Distinguished Service Order (1916) and Companion of St. Michael and St. George (1919) by his Government. Seven times he was mentioned in dispatches. To his men he was a hero. Said one officer: "When things were blackest and one defeat had followed another, it was wonderful to see how the young officers and men admired the big fellow in the worn greatcoat who never revealed the slightest sign of fear." British officers still remember how, as a staff colonel in the operations section with Haig during the heavy German offensive in March 1918, Dobbie could not be disturbed by discouraging dispatches.

Even then he was a man of deep religious faith, and had been since his schooldays. "When I was a boy in my teens," he said once, "I heard it said that Christ came to earth to reveal the ways of God to man, but I had never taken it in. I got to thinking it might be a sensible thing to take the trouble to turn to the Bible and see for myself. I've read the Bible every day since then—always, if possible, before the day's work, and often before having to make decisions." Dobbie, who is a member of the Plymouth Brethren and the author of numerous pamphlets on religion for army use, finds that neither the progress of science nor war has disturbed his faith. Nor does he believe that the military profession is necessarily an evil. "It will . . . be seen," he has written, "that the Scripture indicates that the profession of arms is an honorable and lawful one: that the use of force and material weapons is not incompatible with faith in God: that God is a God of order who has ordained that human governments shall maintain order with force: that the time is not yet, though it will surely come, when 'the government will be on His shoulder' and man will be able to beat his sword into a ploughshare."

After the war Dobbie was promoted rapidly—to brevet colonel in 1922, lieutenant colonel in 1925, colonel in 1926. He served with the Rhine Army, in the Aldershot Command and, later, in the Western Command. From 1926 to 1928 he was general staff officer, first grade, in the War Office in London. In 1928, during the Arab-Jewish riots in Palestine, Dobbie was given the task of restoring order there. "This will be the easiest war we ever fought in," he was heard to remark on the trip out. "We will have to fight only four days a week. The Arabs won't fight on Friday, the Jews won't on Saturday, and Dobbie certainly won't on Sunday." During the next four years he was brigade commander in Egypt. Then, in 1933 he returned to England, a major general, to become commandant of the School of Military Engineering at Chatham and commander of the Chatham Area, officer commanding the Royal Engineers Depot at Chatham, and inspector of the Royal Engineers. Peculiar to his administration were the Bible classes he held each week for the officers and men of his command. In 1935 Dobbie was again sent overseas, this time as general officer commanding the British forces in Malaya, a post which he held until his retirement with pension in 1939.

When the Second World War burst upon Europe in the fall of 1939, Dobbie, though in retirement after a long and active military life, offered his services to his Government. The following April he was sent to command the strategic Mediterranean island of Malta, which was situated nine hundred miles in either direction from the nearest friendly base, Gibraltar to the west and Alexandria to the east. Once believed by some London officials to be a military liability, Malta is now credited with contributing largely to the downfall of the Axis power in the Mediterranean theater and elsewhere. Under General Dobbie's guidance, Malta became a constant threat to the Axis supply line, prevented thousands of Axis planes from reaching Europe and engaging in action in the Battle of Britain and on the Russian front, and provided a base for British submarines preying on Axis shipping. Serving first as acting governor and later as governor and commander in chief, Dobbie became the most popular leader the Maltese ever had, winning their respect and confidence by a belief in God and courage under fire which matched their own. When the initial attack occurred on June 11, 1940, the day after Mussolini '42 declared war on the Allies, Il Duce boasted that the taking of Malta would be only a matter of days, for the island was totally unprepared. With a garrison that numbered less than five thousand, General Dobbie, however, set out to defend the more than thirty miles of coastline of the island against overwhelming odds. For the first three months of the siege, he had only four nearly obsolescent airplanes, one of which was defective and unable to fly. Manned by some seaplane pilots who had never flown fighters, three of these planes—nicknamed "Faith", "Hope," and "Charity" by the islanders—together with a few antiaircraft guns, managed to keep off the swarm of Axis bombers and fighters during the months before aid came.

Malta did not fall, but its 270,000 people, huddled together in limestone caves honeycombing its ninety-one and a half rocky square miles, suffered greatly. Two-thirds of the island's food supply had to be imported and shipping of both food and matériel was paralyzed by the perils of enemy planes, submarines, and surface vessels. Yet the people and General Dobbie were equal to the situation, and together they firmly believe that it was God's help which brought them through the crisis. Typical of their spirit was one of Dobbie's orders of the day: "It may be that hard times lie ahead of us, but however hard they may be, I know that the courage and determination of all ranks will not falter, and that with God's help we will maintain the security of this fortress. I call on all officers and other ranks humbly to seek God's help and thus in reliance on Him to do their duty unflinchingly."

Dobbie is described as steadfastly calm and unflinching in the face of danger. During the worst air raids he could be found helping the wardens to rescue the wounded and helpless. (At one time he rescued a Persian cat, Maurice, which became his constant companion.) A young British officer, proud of his commander's courage, said: "Dobbie paid no more attention to bombs and machine-gun fire than to rain. He was in the tower of the palace roof when the Germans, trying to get the crippled *Illustrious* at the dockyard, concentrated more fire power on Valetta and Grand Harbor than has ever been released on any other spot on earth." Each day German and Italian planes were bombing and strafing the ship, which had limped into Malta for repairs, and for four successive days bombs were aimed at the crippled carrier but failed to inflict a mortal wound. "It was a wonderful sight," said Dobbie, "when on the evening of that fourth day the *Illustrious* steamed out of the harbor under her own power." During his command at Malta, Dobbie held nightly Bible classes and quoted the Scriptures in his War Office reports.

When Dobbie was relieved at Malta by the new governor, General the Viscount Gort '40, in May 1942, he had accomplished the complete fortification of the island and turned it into a bulwark which in March 1942 destroyed 275 German and Italian planes and badly damaged 600 others. Dobbie had also established cooperation of the chiefs of the Army, Navy, Air, and civilian forces through a central defense group and had, among other acts, exiled a boatload of Fifth Columnists. All this he did, say the island's defenders, "by his engineering skill, by his understanding of aviation, by making the most of the skills of many others—in a word, by personality and leadership." Prime Minister Winston Churchill '42, praising his work, said it "entitled him to release and repose." And for the gallant stand the Maltese made under General Dobbie, King George VI '42 awarded "to the fortress of Malta itself" the George Medal. In 1941 Dobbie, who had been elevated to the rank of temporary lieutenant general that year, had also been made Knight Commander of the Order of the Bath. In 1942 he was made Knight Grand Cross of St. Michael and St. George.

Sir William returned to England to rest, and to lecture on his experiences at Malta and his belief in the religious basis of this war. "If ever we have gone to war on a spiritual issue it is now," he wrote in 1942. "We are not only fighting for our existence and for the preservation of our institutions, we are fighting for the fundamental principles without which life, whether individual or national, will not be worth living. There can be no vestige of doubt that our cause is righteous, and that it must be in accordance with God's will." In January 1945 he began a similar lecture tour of the United States and Canada sponsored by the Moody Bible Institute of Chicago, during which, accompanied by Lady Dobbie, who had been with him at Malta, he traveled 15,000 miles, visiting forty cities and addressing audiences aggregating 150,000 persons. While in Ottawa he was entertained at Rideau Hall by the Earl of Athlone, Governor General of Canada, and Princess Alice. At Washington, Sir William and Lady Dobbie were guests of the White House. At City Hall in New York, the General was received by Mayor La Guardia '40.

General Dobbie, whose troops referred to him familiarly as "Old Dob Dob," has been described by a *Liberty* interviewer as "a huge, quick, but heavy-going man with thick gray hair, reddish eyebrows run wild, and a short gray mustache." "The most singular thing about him," says the same interviewer, "is the serenity of his deep-set gray-blue eyes." Like Field Marshal Sir Bernard Montgomery '42, Dobbie is a teetotaler, and does not smoke. Young men who have fought under him report that they will never be the skeptics they were before the war. Dobbie "did something" to them, they said. Added one young officer: "Old Dob is the simplest, humblest, gentlest of men. There never was a man with less vanity. I think that's one reason why after two years with him, I've found it so difficult to describe him to others. There's nothing to get hold of, no oddities. He was never excited in his life. There is in him an inner calm hard to explain." Dobbie, his men said, was always fair: it was a job done, not rank or position which mattered.

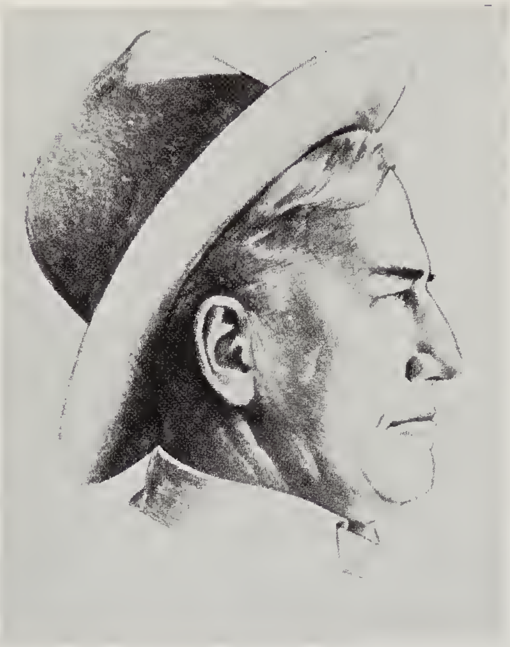
Who's Who, 1945

DOBIE, J(AMES) FRANK (dō'bĭ) Sept. 26, 1888- Folklorist; author; college professor

Address: b. University of Texas, Austin; h. 702 Park Pl., Austin, Tex.

The man who "probably knows more about Texas folklore than any other man alive" is J. Frank Dobie, leading authority on the culture of the Southwest. The Lone Star State's colorful citizen, who refuses to be an academician, is known as "the maverick professor"—he teaches at the University of Texas, where his course "Life and Literature of the Southwest" has attracted students for more than fifteen years. Dobie is the author or editor of some thirty books on the subject, and his articles have appeared in a number of national magazines. He occupied the chair of American history, on an exchange professorship, at England's Cambridge University in 1943-44, a year that brought forth his book *A Texan in England* (1945). The Texan, who is also known for his outspoken liberalism, found much to admire in England, and book critics found much to admire about his book.

James Frank Dobie was born on a Texas ranch, in Live Oak County, on September 26, 1888, the eldest of the six children of Richard Jonathan and Ella (Byler) Dobie. Heir to the old Texas traditions of a family long established on the range (his great-grandfather had come to Texas from Virginia in 1834), the boy lived on the family ranch of about seven thousand acres until his sixteenth year. Dobie tells the story of his childhood in *St. Nicholas* magazine, October 1933. His mother, who had been a teacher, gave him his first lessons—it was his parents, he said, who gave him his taste for literature; and it was the range country which taught him much besides—"the land



From a drawing by Tom Lea

J. FRANK DOBIE

on which I was reared and the brush growing on the land taught me more than schoolteachers have ever taught." For a time, with his brothers and sisters he went to the one-teacher schoolhouse built by several ranch families, and he had his share of chores to do. After going to high school in the town of Alice, forty miles away, he attended Southwestern University in Georgetown, Texas, where he received his B.A. degree in 1910. One summer before his graduation young Dobie studied at the University of Chicago, although he was drawn back to the ranch nearly every vacation. For one year (1910-11) Dobie was school principal in the Texas town of Alpine, after which he returned to Southwestern University as teacher of English and secretary to the president. During the summer of 1914 he worked on the Galveston *Tribune* as reporter, work he had done for one summer four years earlier on the San Antonio *Express.*

In 1914 Dobie received his M.A. at Columbia University and that year he joined the faculty of the University of Texas, where, except for a few absences, he has remained. During the First World War he served as a first lieutenant in the 116th Field Artillery and upon his return from France in 1919 he resumed his teaching career at the university. But after a year Dobie became dissatisfied with academic life and turned to his "earliest love," cattle raising. Accordingly, for the year 1920-21 he managed his uncle's quarter-of-a-million-acre ranch on the Nueces River. There he conceived the idea to which he has since devoted his life—to collect and retell the legends and folk tales of Texas.

In 1921 Dobie was back at the university, where he taught for two years before becoming head of the English department at Oklahoma Agricultural and Mechanical College. He held that position until 1925, when he returned to the University of Texas as adjunct professor of English. A year later Dobie became an associate professor and in 1933 a full professor, the first native Texan to receive a full professorship in the university's English department. This was also unusual in that Dobie did not have a Ph.D.—of which he says: "I early learned that a Ph.D. thesis consists of transferring bones from one graveyard to another." During 1930-31 he held a research fellowship in the Laura Spelman Rockefeller Foundation and another in 1934-35. In the intervening time (1932-33), on a grant from the Guggenheim Memorial Foundation, he traveled two thousand miles on muleback gathering folklore. Much of his research has been done around camp fires, at trading posts, and in chuck wagons.

The folklorist has said that the only reason he teaches is to give his course, "Life and Literature of the Southwest," called the most popular course at the University of Texas. Labeled "a very unprofessorial professor," Dobie teaches through "windy, chatty yarns" and sings the ballads of the trail in his cowboy baritone. Class discussions on controversial subjects range from "a tirade against Pappy O'Daniel [Senator W. Lee O'Daniel] to a discourse on the race question." Dobie has called himself the outlaw of the campus, where he carries on a determined crusade to "keep Texas unique." His opposition to any attempt to standardize Texas has brought him into conflict with university officials, legislators, and politicians. When in 1936 the university's new twenty-seven-story, two-million-dollar building was opened, the professor was bluntly indignant. "It's like a toothpick in a pie," he declared as he refused to take office space in it. His acid remarks on a certain piece of campus sculpture brought admiring comments from Alexander Woollcott '41.

Dobie has also clashed with the university's board of regents. Late in 1943 he joined a faculty and student group in petitioning for the immediate reinstatement of three teachers who had been dismissed for their activities outside the school. This case eventually led to the dismissal of Dr. Homer P. Rainey, president of the university, who charged the regents with suppression of academic freedom. The Rainey case held national attention and resulted in the probation of the university in July 1945 by the Southern Association of Colleges and Secondary Schools. Actively supporting Rainey, Dobie said in his testimony at hearings that freedom was at stake in Texas.

When the Manford Act became law in Texas in 1943, to provide for strict regulation of unions and licensing of organizers, Dobie expressed his opinion in typically frank fashion. "A man can come to Texas and without interference invite all the people he wants to join the Republican Party, the Liar's Club, the Association for the Anointment of Herbert Hoover as Prophet, almost any kind of organization except one. If the Manford Law is an index of capitalism's future policy, the people had better begin digging cellars for the revolution." Dobie often uses his column in a Texas newspaper to express his opinions. The writer has a large progressive following in his state and in 1944 efforts were made to draft him to run for governor against Coke Stevenson, but Dobie declined. Describing himself as a liberal Democrat, he supported Roosevelt '42.

Dobie went to England in 1943 for the first time, to succeed Henry Steele Commager of Columbia as professor of American history at

Cambridge. (Commager was the first man to hold this position.) In commenting editorially on the Texan's appointment, the New York *Herald Tribune* said: "In Mr. Dobie the British will find a teacher different from any they ever saw before, and the impact upon them is sure to be considerable. . . .His venture into the halls of Cambridge promises to be one of the most happy of all our ambassadorships." In residence at Emmanuel College at the venerable British university, Dobie taught his own special kind of American history to RAF, Royal Navy, and civilian students. He also lectured for the OWI and the British Army Education Office. Dobie confessed that during the first term he "boned like any freshman." He explained that "he hadn't read the American Constitution since he was a boy and didn't understand it then, that he did know the length of the horns of longhorn steers . . . the music inherent in coyote howling . . . the smell of coffee boiled over mesquite wood."

In the course of his stay in England the "sombrero wearer among men in togas" wrote of his experiences for American magazines, and on his return to the United States these were incorporated in 1945 into a book, *A Texan in England*, filled with portrait sketches, anecdotes, descriptions, and "a fine appreciation of the best of England." Thus it abounds in word pictures of the English countryside, pubs, London under bombings, and many sorts of men and women in whom the author sees such qualities as casualness, patience, politeness, reticence.

While Dobie had written the final chapter of his book in England, on his return home he decided to write a new ending, which he calls "What England Did to Me." Oppressed by the atmosphere he found at the University of Texas, an atmosphere he termed "remote from the air of intellectual freedom enveloping Cambridge," he wrote: "Here on this campus, believers in the right as well as the duty to think are combating a gang of Fascist-minded regents: oil millionaires, corporation lawyers, a lobbyist, and a medical politician, who in anachronistic rage against liberal thought malign all liberals as 'Communists,' try with physical power to wall out ideas, and resort to chicanery as sickening as it is cheap. My mind is paralyzed by this manifestation of 'the American way of life.'" On a few other scores, too, Americans suffer from comparison with the English.

The critic J. A. Brandt thought that *A Texan in England* showed Dobie "politically alive, acutely sensitive to human rights and wrongs and making a hard-muscled stand for the right." Clifton Fadiman '41 wrote: "Though not deeply reflective nor particularly well organized, it is an honest and loving essay"; and Roger Pippett remarked that "no more lyrical account of the English countryside has been written by an American." In mild dissent, Englishman W. H. Hindle found Dobie's book "too much a picture of a gentlemanly, feudal England," and somewhat of an apology for this feudal way of life. Struthers Burt's opinion appeared in the New York *Times*: "At times, Frank Dobie can write carelessly and hastily, and in an odd and not too pleasing staccato fashion, although, as has been said, he can never write uninterestingly; but over and over again his prose rises into something so translucent and starkly noble that it becomes Elizabethan." In the summer of 1945 Dobie returned to England to teach in the United States Army University organized near Oxford. At that time *A Texan in England* was going into its sixth printing.

The story-teller of the Southwest is the author of a number of other books, among them *A Vaquero of the Brush Country* (1929), *On the Open Range* (1931), *Tongues of the Monte* (1935), *The Flavor of Texas* (1936), and *Guide to Life and Literature of the Southwest* (1943). *Coronado's Children* (1931), a collection of legends of lost mines and buried treasures of the Southwest, was a Literary Guild selection. It was described by the *Saturday Review of Literature*'s critic as "a rich and fascinating volume, compiled with gusto." In his review of *Apache Gold and Yaqui Silver* (1939) Oliver La Farge declared: "Mr. Dobie's accounts are alive with the space and color of his setting." The writer's study of a vanishing breed of cattle, *The Longhorns* (1941), was greeted as a valuable, "full-bodied" work. Dobie's articles have appeared in such magazines as the *Yale Review*, *American Mercury*, *Atlantic*, and the *Saturday Evening Post*. In an issue devoted to the culture of the Southwest, the *Saturday Review of Literature* (May 16, 1942) carried the Texan's story of "Mister Ben Lilly," extraordinary bear hunter. The May 1943 issue of *Natural History* contains his lengthy study of "The Conquering Mesquite." Since 1922 Dobie has been editor and compiler of the annual publications of the Texas Folk-Lore Society, of which he is also secretary; and since 1924 he has been contributing editor of the *Southwest Review*.

Noted for his devastating frankness, Dobie is described as a "brash, blue-eyed scrapper" with a "wide Texas smile, a broad Texas hat, and a still wider Texas accent." A ruddy, stocky man of five feet eight inches, he is a vivid and versatile personality, known as "Pancho" to his friends. Dobie's wife, the former Bertha McKee, also a Texan, to whom he was married in 1916, at one time taught school after their marriage so that her husband might have time for writing. Her special interest in plants and gardens has been of value to Dobie—it is evident in what has been called as probably the best single chapter in *A Vaquero of the Brush Country*, a chapter on plant life in the brush country.

When Dobie works at his typewriter his hat is usually on his head, and he will read aloud what he has written, "tinkering" with sentences until they "sing like a fiddle." His hobbies are not far removed from his vocation—he collects literature on the range country and objects made of horn, and his favorite recreations are horseback-riding and deer-hunting. When Cambridge University awarded the Texan the honorary degree of Master of Arts, the citation read in part: *De bobus longicornibus quod ille non cognovit, inutile est aliis cognoscere.* In unacademic English that tribute reads: "What he doesn't know about longhorn cattle isn't worth knowing."

DODDS, HAROLD W(ILLIS) June 28, 1889- University president

Address: b. c/o Princeton University, Princeton, N.J.; h. Prospect, Princeton, N.J.

As the academic year 1945-46 got under way, Princeton University was preparing for its bicentennial in 1946. Under the leadership of President Harold W. Dodds, whose competence in many fields has earned him the appellation of "best-known North American in Central and South America" and "one of the foremost authorities on local government problems," the university plans to highlight its celebration with round-table conferences on postwar problems affecting education, conferences to be attended by the world's leading scholars. Princeton, states a New York *Sun* editorial, is looking to the future rather than to the past.

Harold Willis Dodds was born in Utica, Pennsylvania, on June 28, 1889. His father was Samuel Dodds, a descendant of James Dodds, who came to settle in western Pennsylvania in 1760 from County Down, Ireland; his mother was Alice (Dunn) Dodds. The youth attended Grove City College (Grove City, Pennsylvania), where his father, a Presbyterian minister, was Bible professor. Young Dodds was graduated in 1909, a member of Phi Beta Kappa. Twenty-six years after his graduation, in his own words of guidance to the Princeton class of 1937, President Dodds recalled the teachers to whom he himself owed "the heaviest debts of gratitude" as those "who had urged young people to take chances rather than to succumb to sure things." His own graduation was followed by two years of teaching, after which he began postgraduate work at Princeton University, receiving his Master's degree in 1914. From 1914 to 1916 Dodds was instructor in economics at Purdue University, and in 1917 he took his Ph.D. degree at the University of Pennsylvania. When defective eyesight caused his rejection for military duty in the First World War, Dodds offered his services to the United States Food Administration and received the post of executive secretary for Pennsylvania, which he held until 1919.

In that year Dodds accepted a position as assistant professor of political science at Western Reserve University and for a year taught courses in American government and in international law and politics. Then his steadily growing interest in problems of local government determined his resignation from the Western Reserve faculty to accept the position of secretary to the National Municipal League and editor of its journal, the *National Municipal Review*. Dodds remained as secretary of the League through June 1928 and as editor of the *Review* until 1933, at the same time engaging in a number of other activities. In 1922 he lectured on a part-time basis on the subject of municipal government at the University of Pennsylvania; in 1924, on the same subject at Swarthmore College; in 1925, on political science at New York University. Also in 1925, he began lecturing on politics at Princeton University. And in 1922, in Nicaragua, he had begun his career as electoral adviser to Latin American governments. He was also technical adviser to General John J. Pershing when the latter was president of the Tacna-Arica Plebiscitary Commission acting during the dispute over that province between Chile and Peru in 1925-26, and he acted as consultant on electoral law and procedure to the Cuban Government in 1925.

In 1922, upon the recommendation of Secretary of State Charles Evans Hughes '41, Dodds was selected as electoral adviser to the Nicaraguan Government, in which capacity it became his task to formulate a new electoral law for a nation which had not yet known a free or incorrupt election. The new law, known popularly as the Dodds Law, was adopted by the Nicaraguan legislature in 1923, but with changes which, according to Henry L. Stimson '40 and others, "seriously weakened its integrity." It was originally intended that the United States supervise the ensuing presidential election of 1924, but the Conservatives in office, disagreeing with the Liberals, rejected the plan, and the short-lived coalition incumbency of 1925 was ousted by the *coup d'etat* of General Chamorro, the defeated extreme Conservative candidate, soon after the United States Marines were withdrawn from the country in August 1925. Although late in 1926 a reconstituted *de jure* legislature elected Adolfo Diaz president-designate under the provisions of the Nicaraguan constitution, civil war broke out between the Liberals and Conservatives, and was not quelled until Colonel Stimson was able to persuade both sides to accede to a strict and complete supervision by the United States of the scheduled 1928 presidential election.

The American supervision was to be carried out by a National Board of Elections of Nicaragua, having as its chairman United States Brigadier General Frank R. McCoy '45 and including one representative of each of the parties. Dodds was appointed chief adviser to McCoy, and the election was to be conducted under the provisions of the Dodds Law. "This election," wrote Dodds afterward, "was not merely to be 'observed' by a few American representatives, but an American was to sit as chairman of every election board—national, departmental and local—with a deciding vote in all electoral matters and appropriate police powers to make the supervision effective." It proved to be the most successful and orderly election in Nicaragua's turbulent history, of which Dodds has written: "Since the day of her independence Nicaragua's story has been one of bitter feuds between Liberals and Conservatives, with the spoils of office and revenge the chief motivating factors. With the possible exception of a slight divergence in attitude toward the Catholic Church, there are no appreciable differences in principles or practices to provide a basis for choice between the two parties, but the average Nicaraguan is nevertheless a violent partisan of one or the other. In reality the two parties are much like two opposing gangs, and their political struggles can best be interpreted in terms of gang warfare." In 1935 Dodds was again asked to act as arbiter in an election dispute, this time in Cuba. In three days' time his compromise plan was completed and adopted.

In 1927 Dodds was appointed a professor of politics in Princeton University, and it was the added demands of this new post which caused him to resign as secretary of the National Municipal League the next year. In 1930 he was made chairman of the administrative committee of the newly established School of Public and International Affairs at Princeton, the purpose of which, in the words of former President John Grier Hibben of the university, was "to develop for the country each year a body of young men who will have not only a preliminary foundation for public and international careers but also a new sense of direction and responsibility for the affairs of their state and country." In 1932 Dodds was selected to direct a survey of New Jersey State administration undertaken at the request of Governor A. Harry Moore. "With twenty assistants [from the Princeton faculty]," noted William Lyon Phelps '43 at the conferring of the honorary Ph.D. degree on Dodds by Yale University in 1933, "Dr. Dodds worked four months without missing a class or a lecture and turned in a report of 150,000 words showing how the State could save $14,000,000."

In January 1933 the National Municipal League reluctantly accepted Dodds's resignation as editor of the *National Municipal Review* "because of increasing responsibilities at Princeton," at the same time appointing him chairman of the editorial council of the *Review*. (The following year the League elected him to its presidency.) A few months later it was announced that Dodds had been appointed fifteenth president of Princeton University to succeed John Grier Hibben. Statistically, Dodds became the youngest appointee to the office in 175 years, the third youngest in the history of the university, and the sixth to be appointed from the ranks of the faculty. Concerning the appointment, the *National Cyclopædia of American Biography* said: "His practical experience in governmental matters, chiefly as an adviser in state and municipal administration and finance . . . has given him a unique qualification for the post and his election seems to be a happy culmination of a long search which ended within the university's own walls."

In guiding Princeton Dodds has adhered to a basic and often-expressed formulation of the function of a university in a democratic state. "I suggest," he said at the opening exercises of the 1939-40 academic year, "that Princeton rededicate itself to its historic mission of making democracy work. By this I do not mean greater emphasis upon public affairs in the usual sense of the term. What I have in mind is far beyond politics or forms of government. Even as a form of government democracy is not an end as our forefathers supposed, but a means to an end, the good life. . . .A free society is an opportunity, not a guaranty of happiness. It exists to be used; if it is taken for granted, if its people are passive, uncultivated, or confused, it will be abandoned for some other instrumentality, promising a more automatic human perfectibility. A healthy democracy is not a static thing. When functioning properly it is moving toward something. . . If we assume that it is mature, its power of survival is gone and the usual step from maturity to death will follow quickly. The basic truth here is that democracy must expand or perish. . . .The liberal arts college is the one most available agency to prepare young people to meet the human problems of an expanding democracy. There is no subject in the Princeton curriculum that can not be employed to contribute to this end." "Princeton firmly believes," he said on another occasion, "that trained intelligence, wide range of vision, discipline of mind and spirit, and the other related objectives of education in the liberal arts will continue to be of vital importance in the year 1943 and in all the years to follow." Princeton would continue to encourage original work on the part of its undergraduates "because original thinking toughens the muscles of the mind as no passively acquired information can do."

HAROLD W. DODDS

After more than three years of study, in December 1945 Dodds announced that, beginning in 1947, Princeton would inaugurate a new curriculum plan. Under the plan, which modifies the free elective system, freshmen will be required to "explore each of the four major areas of liberal learning—natural science, social science, arts and letters, and, finally, the trilogy of history, philosophy, and religion." Within each group the student may select his courses, and in his sophomore year he must choose the field in which he will concentrate. In his senior year he may expect to do original study, now often possible for only a graduate student.

Dodds is the holder of seventeen honorary degrees, including citations from Harvard, Yale, and Columbia universities. He is a member of the American Philosophical Society, the American Political Science Association; a director of the Council on Foreign Relations; a trustee of the Brookings Institution and the Carnegie Foundation for the Advancement of Teaching;

DODDS, HAROLD W.—*Continued*

and a member of the Rockefeller Foundation. In 1943 he was chairman of the American delegation to the Anglo-American Conference on the Refugee Problem held in Bermuda. In politics he is a Republican, and he has expressed his political creed thus: "I submit that democracy can not survive through trust in systems alone. Collective action demands greater competence on the part of the individuals acting than extreme individualism ever required. I have never accepted a philosophy which finds man's highest good in absorption by and subjection to any higher group in which his personality is supposed to be dissolved and then translated. I insist on an individual's right to kick and to persuade others to kick with him. I believe that in politics his majesty's opposition is as important as his majesty's government." In late 1945 Dodds became identified with two conferences concerned with postwar problems. He was named to a nine-member committee set up by President Truman '45 to coordinate Government medical services, of which the primary task "is to find ways of increasing the medical facilities of the United States Veteran Administration." He also became one of the sponsors of the conference for Safeguarding Wartime Savings, a movement fostered by the National Association of Better Business Bureaus to protect the American public from swindlers, who are anxious to dip into the billions of dollars the public saved during the war.

Princeton's president has written articles on governmental administration, foreign affairs and education that appeared in *American City, National Municipal Review, Foreign Affairs* and other periodicals; of a study, *Procedure in State Legislatures,* published by the American Academy of Political and Social Science in 1918; and of a book, *Out of This Nettle, Danger* (1943), which the New York *Times* characterized as a "concise compendium of reconstructive citizenship by one who believes that 'history is a spiritual achievement' and that 'the ethic of liberalism is the Christian ethic.'" Many of the university president's addresses are printed in the magazine *Vital Speeches of the Day.*

Dodds was married to Margaret Murray, of Halifax, Nova Scotia, on Christmas Day 1917. He is a member of the Century, Princeton (New York), and Nassau (Princeton) clubs, and has expressed a strong personal liking for life in the country. He stands five feet eleven inches tall, weighs one hundred and sixty pounds, has blue eyes and gray hair.

DOUGLAS, EMILY TAFT Apr. 19, 1899-
United States Representative from Illinois

Address: b. House of Representatives Office Bldg., Washington, D.C.

As of 1945, Illinois is one of the two states in the Union to have two women Representatives in Congress. Like Connecticut, too, Illinois has a women Congressmen on each side of the dividing aisle in the House. On the Republican side sits Jessie Sumner '45 and on the Democratic, Emily Taft Douglas, Representative at Large from the Prairie State. Mrs. Douglas won a surprising victory in her first political candidacy, and an important committee assignment, the Foreign Relations Committee, in her first term in Congress.

Emily Taft Douglas was born in Chicago on April 19, 1899, one of the three daughters of the famous sculptor Lorado Taft and Ada (Bartlett) Taft. Her grandfather, Don Carlos Taft, was the first professor of science at the University of Illinois; William Howard Taft was a distant cousin. Her father was also an art teacher, writer, and a lecturer, often traveling twenty-five thousand miles in one year. From her childhood little Emily was internationally minded—her father made annual visits to the great European art centers—and she was also influenced by his work with the League to Enforce Peace during World War I. Despite her family's Republican tradition, she was impressed "terrifically" by Democratic President Wilson and his work for the League of Nations. "When he died," Mrs. Douglas recalls, "I remember I said to myself, 'If there's anything I can do to forward the things he stood for, I'm his man.'"

Meanwhile, the future Representative had her heart set on a stage career, but her parents insisted she must finish college first. So Miss Taft packed four years at the University of Chicago into three, receiving her B.A. in 1920. In 1922 she was given the lead in the mystery thriller, *The Cat and the Canary,* which she says scared her even in rehearsal. Two years later she was still playing the same role: "When it was over, I had had enough mystery to last me the rest of my life." Back she went to Chicago for graduate study in government and political science. In 1931, when she was thirty-two, Emily Taft was married to Paul Howard Douglas, professor of economics at the University of Illinois. Douglas has been described as "standing out like a landmark above the contemporary run of professors of economics." The couple have one daughter, Jean Taft, born in 1933. (Professor Douglas also has two sons and two daughters by an earlier marriage.) A specialist in industrial relations, Douglas is "a profoundly convinced and yet cheerfully optimistic nonviolent revolutionist," who believes firmly in the "family wage": inclusion in a worker's pay of an allowance for each dependent, a system already in operation in France and compulsory in Australia. (In the Second World War, Douglas enlisted in the Marines, rose to be a major, and was wounded on Peleliu and Okinawa. After his return to the United States he served as chairman of the planning committee for the Labor-Management Conference held in November 1945.)

In 1935 Paul and Emily Douglas spent a three-month vacation traveling through Europe. "Paul and I stood under the palace balcony in Rome on the day Mussolini '42 announced he had sent his troops into Ethiopia," Mrs. Douglas recalls. "I think out of all that wild and delirious multitude, we were probably the only ones who froze with fear and foreboding of what that meant. Suddenly, all the things we had seen and suspected that summer fell into place. It came crystal clear to us then and there that if Hitler '42 and Mussolini and the forces they represented were not stopped, the whole world would be engulfed."

On their return to Chicago, the Douglases took up the task of warning their fellow citizens of the impending catastrophe. In 1938 Professor Douglas won election as Democratic alderman from the Fifth Ward to the Chicago City Council. Mrs. Douglas became an organizer for the League of Women Voters, and, in time, chairman of the Illinois League of Women Voters' department of government and foreign policy. "We wanted to strengthen democracy at the grass roots," says Mrs. Douglas, who therefore became active in local Democratic politics and "did ward work for a variety of local liberal candidates, some successful and others not." In 1942 she also became secretary of the Carnegie-endowed International Relations Center in Chicago, a clearinghouse for information, and took charge of its pamphlet shop.

In that year, when Paul Douglas still had one year to serve as alderman, he ran for Senator as an independent Democrat, but was defeated. Ten days later the fifty-year-old professor enlisted in the Marine Corps as a private. It never occurred to his wife that she might go to Congress in his stead, and when the Chicago Democratic leaders asked her to run for Representative at Large in 1944, she countered with, "Gentlemen, this is so sudden!"

The prospect was not a particularly encouraging one. To become Representative at Large from Illinois meant that she would have to win the support of a population of 7,897,241—the third largest state constituency in the country, and one traditionally Republican and isolationist. In her first campaign she would be opposed by a veteran incumbent, the Chicago *Tribune*'s candidate, Stephen Day. Paul Douglas, by then a captain, was on combat duty in the South Pacific, but his wife had no doubt of what his advice would have been. He had urged her to enter politics—therefore get into the campaign she did, at the time caring for little Jean and doing all her housework singlehandedly because she could not get a maid.

Apart from charging that Day had abused his Congressional franking privilege and was associated with the Nazi-minded George Sylvester Viereck '40, Mrs. Douglas campaigned entirely on a platform of support for President Roosevelt's '42 foreign policy and for world cooperation, stating that Day "by his voting record stands convicted as the worst obstructionist in Congress." The ultraconservative downstate districts were still sending to Congress Representatives who voted against Lend-Lease. The Republicans saw no threat to their usual solid majorities there from the shy, serious Mrs. Douglas; but small groups, who knew her work with the League of Women Voters, campaigned so effectively that even the rural districts gave her helpful pluralities. On Election Day, while Illinois elected a slate of Republican State officials, it sent to Congress Democratic Senator Scott Lucas, and Mrs. Douglas. She polled 2,030,573 votes to her opponent's 1,839,518, a margin larger than that accorded President Roosevelt '42 in the same territory. Said the new Representative-elect, "It was a clear-cut victory for the President's foreign policy."

Corboy
EMILY TAFT DOUGLAS

Representative Douglas was an obvious choice for the House Foreign Affairs Committee, which is headed by Sol Bloom '43. Conservative Arthur Krock '43 calls her "an expert in the field, highly qualified to debate foreign policy questions in the House and estimate the binding actions of the Senate." It was thought, however, that she might not be placed on it, because it was a "prestige" assignment ordinarily given only to experienced Representatives, and because it already included two Illinoisans (Democrat Thomas S. Gordon and Republican Robert B. Chiperfield) and two women, Republicans Edith Nourse Rogers '42 of Massachusetts and Frances P. Bolton '40 of Ohio. Republican Clare Boothe Luce '42, Connecticut, had been refused a Foreign Affairs seat. But at the party caucus the Democratic membership was enlarged to fifteen so that Mrs. Douglas and Helen Gahagan Douglas '44 of California could be seated—a distinction comparable to that bestowed on Ruth Bryan Owen '44 sixteen years earlier. With the assignment of the third new woman Representative, Chase Going Woodhouse '45 of Connecticut, to the Banking and Currency Committee, it ceased entirely to be true that women, like Independents, were seldom placed on the major committees.

The first time Mrs. Douglas walked into the House she was stopped by a page who failed to recognize "all these dames"; the first time Speaker Sam Rayburn '40 gave her the floor, she failed to recognize herself as "the Gentleman from Illinois." (Women Representatives are traditionally referred to as "the Gentlewoman from. . ." but force of habit is strong even in Speakers.) But this inauspicious beginning was more than made up for when, on her third day in the House, Mrs. Douglas was invited to preside over its deliberations for a

DOUGLAS, EMILY TAFT—*Continued*

short time, a gesture which left her "a little trembly." To interviewers, the Representative from Illinois said: "In Congress, and especially in my work on the Foreign Affairs Committee, I am going to proceed on the thesis that the will to get along with the other nations of the world is of greater importance than the machinery. . . .We ourselves must have faith in the doctrine of collective security as a bulwark against another war and chaos. We must be prepared to make whatever compromises and sacrifices that security demands. And we must then persuade the other nations of our sincerity."

On the Seventy-ninth Congress' first roll-call vote, in January 1945, Mrs. Douglas said "Nay" to the reconstitution of the (Dies '40) Committee on Un-American Activities as a permanent standing committee; in February she voted for the May '41-Bailey '45 "limited national service" bill, and for immediate consideration of the George '43 bill to remove the RFC lending agencies from the Department of Commerce—an indirect vote for Henry Wallace '40 as Secretary of Commerce.

In March 1945 Mrs. Douglas came out for the drafting of nurses into the armed forces, and voted also for the compromise manpower bill. As befitted a freshman in Congress, she "kept her eyes and ears open and her mouth shut" at the Foreign Affairs Committee meetings and hearings on the extension of Lend-Lease and other momentous matters. She "accepted a few assignments" to speak in favor of the Dumbarton Oaks world security plan for the League of Women Voters. Her semi-monthly newsletter, *Window on Washington,* addressed to her Illinois constituents, drew praise from Henry Hoke, editor of the *Reporter of Direct Mail Advertising* and crusader against the abuse of the frank: he cited her and Augustus W. Bennet, Republican of New York, as examples of the worthiest use of the Congressional franking privilege. Among the information contained in the first few issues of *Window on Washington* was that Mrs. Douglas had decided to hold open competitive examinations for her appointments to West Point and Annapolis, although she pointed out that there would be only one such vacancy through 1946. In August Mrs. Douglas and several other members of a subcommittee of the House Foreign Affairs Committee went abroad to study the United Nations Relief and Rehabilitation Administration in Western Europe and the controversies which had arisen about it. Before the close of the year Mrs. Douglas and Representative Jerry Voorhis '41 of California introduced legislation to empower the United Nations Organization to control armaments and outlaw the atomic bomb.

In appearance Emily Taft Douglas is "little and cute." Five feet two inches tall, she weighs one hundred twenty-eight pounds. The blue-eyed and brown-haired Chicagoan uses little or no makeup, wears glasses for reading, and is described as "a quiet, housewifely person—an unusual type on the political rostrum." Her chocolate cake is reported to be "awfully good," but with so many important things to be done she begrudges the time consumed in domestic tasks. Representative Douglas has had as much trouble as anyone else in finding a house in Washington and someone to take care of it. She is a voracious reader, especially of facts; she has "a passion for French pastry," likes to swim, and enjoys reading to her daughter and helping her with her stamp collection. The Representative delivers few addresses and gives little time to social affairs. "I'm niggardly with my evenings," she says with a smile.

DUNNE, IRENE Dec. 20, 1904- Actress

Address: b. c/o Columbia Pictures Corp., Hollywood, Calif.

In the history of motion pictures, several women have been dubbed "First Lady of Hollywood." For years it was Norma Shearer; more recently it has been Greer Garson '42. Spanning the film cycles in which these two have reigned is a third "First Lady," Irene Dunne. In a profession and a community known for the well-publicized briefness of some careers and marriages, Miss Dunne has impressed observers by staying near the top in popularity since 1932, and by having been married to the same man since 1927. She has been equally successful in tragedy, comedy, and musical productions, and has seldom if ever scored a personal failure in more than twenty years of acting.

Of Irish descent, Irene Dunne was born in Louisville, Kentucky, on December 20, 1904. Her father, Joseph John Dunne, was a supervisory inspector of steamships for the United States Government; her mother, Adelaide Antoinette (Henry) Dunne, was an accomplished musician. The Dunnes were well-to-do, and little Irene had a pleasant childhood, attending Loretta Academy in Louisville and studying music with her mother. When the girl was eleven years old her father died, and the widowed Mrs. Dunne and Irene moved to Madison, Indiana, to live with the child's grandparents. During the next few years Irene studied voice and piano with private teachers and for the first time earned her own money by singing on Sundays in the church choir. After a year's study at a music conservatory in Indianapolis she accepted a position as music and art teacher in an East Chicago (Indiana) high school. While traveling to East Chicago, she noticed a newspaper advertisement of the annual scholarship contest held by the Chicago Musical College, and made a quick decision to stop in Chicago to enter the contest. Competing with singers who had had professional coaching, she won the scholarship which enabled her to study voice at the college for a year.

When her scholarship year was over, Miss Dunne headed for New York, determined to add her name to the roster of the Metropolitan

Opera Company. After auditioning, however, she was rejected for being "too young, too inexperienced, and too slight." Turning to musical comedy, Miss Dunne won the leading part in a road company of *Irene*, and after a five-month tour forgot opera and went on with other plays—*The Clinging Vine* (1922), *Lollipop* (1924), and *The City Chap* (1925). The next year she toured with *Sweetheart Time*, and also sang with light opera companies in Atlanta and St. Louis. She had continued to study intermittently at the Chicago Musical College, and in 1926 was graduated with high honors. (She is now an honorary member of the music fraternity Sigma Alpha Iota, and in July 1945 she received an honorary degree of Doctor of Music from the Chicago college.)

In January 1927 Miss Dunne opened on Broadway as Diana in *Yours Truly*, and in July of the same year she was married to Dr. Francis Dennis Griffin, a New York dentist. At the time of her marriage she planned to give up her theatrical work, but 1928 found her again behind the footlights, as Polly in *She's My Baby* and later as Arlette in *Luckee Girl*.

The year 1929 proved to be the turning point of her career. The story goes that Florenz Ziegfeld stood next to Miss Dunne in an office building elevator and was so struck by her beauty that he invited her to audition for a part in his forthcoming production of *Show Boat*. She enthusiastically accepted and was overwhelmed at being given the coveted leading role of Magnolia in the road company. An instantaneous success, she played to "standing room only" for seventy-two weeks in almost every large city east of the Mississippi. Soon motion pictures studios were competing for her services.

Columbia Pictures

IRENE DUNNE

Finally Miss Dunne accepted an RKO contract, and in 1930 she said good-by to her husband and left for Hollywood. She and Dr. Griffin had decided that she would spend only as much time in California as her work necessitated, and that whenever possible she would return to New York, where Griffin had his practice. Nearly everyone has forgotten that Irene Dunne's unheralded debut was made in a minor film called *Leathernecking*; her second screen appearance was in *Present Arms*, in which she sang "Careless Kisses," a song by an unknown composer named Oscar Levant '40. Musical pictures were out of fashion at the time, so the prudent singer applied herself to dramatic lessons. After six months of study she felt confident enough to persuade RKO to let her test for the dramatic lead opposite Richard Dix in Edna Ferber's *Cimarron*, in competition with several experienced actresses—and she won it. The picture was released in 1931, and Irene Dunne was hailed as "a new dramatic star." After hearing her deliver Sabra Cravat's speech on election to Congress, the anti-women-in-politics Will Rogers declared, "If women like Irene Dunne would run for Congress, I'd vote for them." *Back Street* (1932), a "tearjerker" in which Miss Dunne appeared, brought in more money than the previous record-holder, *All Quiet on the Western Front*; and after that the star was typed in tragic or heavily sentimental roles. Among them were leads in *Symphony of Six Million* (1932), *No Other Woman* and *The Age of Innocence* in 1934, and *Magnificent Obsession* (1935), in which Robert Taylor was her co-star. Finally, after four years of shedding seas of tears, the soprano was given a singing role.

That opportunity came when the cycle of box-office favor brought film musicals back to the screen again. Thus, in 1935 Miss Dunne was presented in what proved to be her first important musical, Jerome Kern's '42 *Roberta* (adapted from the stage version), in which she shared honors with Fred Astaire and Ginger Rogers '41. She was described as "never having sung in richer voice or with as much feeling, warmth, and understanding. . . .She attains histrionic excellence." The next year she repeated for Universal her stage success in the film *Show Boat*, and was described by Regina Crew of the New York *American* as "the personification of grace and charm in the romantic character of Magnolia. She not only sings entrancingly but displays amazing versatility . . . as a singer and comedienne." Motion picture audiences saw for the first time Miss Dunne's comedic potentialities when the star went through a "shuffle-dance" and blackface song in a scene which "had the audience in stitches." In the words of another reviewer, "Miss Dunne in the role of Magnolia hits an all-time histrionic high. . . .She transcends all former virtuosity."

The vogue for "screwball" comedies in the mid-thirties brought Miss Dunne the offer of the title role in Columbia's *Theodora Goes Wild*—a prim New Englander who writes a daring book and then tries to live up to it. Miss Dunne, feeling certain that she could not play such extravagant comedy, refused the part and went off with her husband on a European vacation, hoping that by the time her holiday was over the story would have either been filmed or shelved. But apparently the studio had confidence in Irene Dunne as a comedienne, for upon her return to work she was once more offered the role of Theodora, opposite Melvyn Douglas '42. Reluctantly she

DUNNE, IRENE—*Continued*

agreed to play the part, and, much to her surprise, she was acclaimed "a comedienne of rare ability." This 1936 success was followed by another comedy, *The Awful Truth* (1938), with Cary Grant '40, of which Louella Parsons '40 wrote: "It is going to make Irene Dunne one of the most sought-after comedy players in filmdom." In 1938 Miss Dunne also appeared in a less successful comedy, *The Joy of Living*, in which she played opposite Douglas Fairbanks, Jr.'41.

Some critics and producers are still baffled by Miss Dunne's success as a comedienne, for, as one writer put it, "How can a woman with the aplomb of a duchess act the madcap so faultlessly?" The actress herself attributes the ability to a natural flair for comedy which she says she inherited from her father, "one of the most fun-loving people in the world." "The best way to be funny," she believes, "is to be cold-blooded and purely mental about it." Miss Dunne now prefers comedy roles, and she advises young actresses to study comedy first because it is more difficult to play than tragedy: "It demands more timing, pace, shading, and subtlety of emphasis. It is difficult to learn, but once it is acquired it can be easily slowed down and becomes an excellent foundation for dramatic acting."

Miss Dunne's appearance in early 1939 with Charles Boyer '43 in RKO's *Love Affair* established them as one of the most popular romantic teams in motion pictures. The film brought such great box-office returns that a few months later Universal costarred them in *When Tommorw Comes*. That year Miss Dunne also played opposite Fred MacMurray in *Invitation to Happiness*. In 1940 she appeared in the comedy hit *My Favorite Wife*, again with Cary Grant. One reviewer wrote, "No other star can be so nicely naughty as Irene Dunne, and in this film she neatly sidesteps the censorable." Alternating between drama and comedy in 1941, she next appeared in Columbia's *Penny Serenade*, with Bing Crosby '41, and in Universal's *Unfinished Business*. Of *Penny Serenade*, the story of a childless couple who adopt an infant, Miss Dunne remarked, "I don't think I've felt as close to any picture. It's very much the scheme of my own personal life." (In 1936 Miss Dunne and her husband had adopted a one-year-old baby girl.) The New York *Sun* reviewer found that Miss Dunne in *Penny Serenade* was "perfectly cast"; and Howard Barnes of the New York *Herald Tribune* wrote that she portrayed the role with "enormous warmth and conviction." In Gregory La Cava's '41 *Unfinished Business*, Miss Dunne, according to one critic, "combined the naïveté of Cinderella and the devastating wit of a Dorothy Parker charmingly," although the picture itself was called weak. (At about this time, in the 1941-42 season, Miss Dunne appeared as guest artist with the Chicago Symphony Orchestra.)

After the failure of Universal's *Lady in a Jam* in 1942, Miss Dunne waited for a good vehicle. She found it in *A Guy Named Joe* (1943), in which she played a Ferry Command pilot loved by both Spencer Tracy '43 and Van Johnson '45. *Variety*, the organ of show business, said her performance was "tops," and the New York *Times'* Bosley Crowther called her, "as lovely and fetching as we've ever seen her—maybe a little more so." Doffing her uniform for a hobble skirt, Miss Dunne next appeared in an adaptation of Alice Duer Miller's narrative poem, *The White Cliffs of Dover* (1944). The actress found a special significance in the story of an American, married to a titled Englishman, who comes to love England "dearly and deeply." "I don't think it smacks of propaganda," she said, "but if it does, then I'm glad. I feel everything possible should be done to cement friendship between the two nations that are most alike and speak the same language." Howard Barnes in his *Herald Tribune* review lauded Miss Dunne's performance for its "artistry and conviction . . . it becomes the rich core of the work." "One of her most eloquent performances," commented Eileen Creelman of the New York *Sun*. Capitalizing once again on the box-office attraction of Dunne and Boyer, MGM costarred them in the latter part of 1944 in the comedy-drama *Together Again*, in which she played a widowed small-town mayor who becomes romantically involved with a New York sculptor. The New York *Sun* declared that Miss Dunne was at her comedy best; and the New York *Herald Tribune* described her as "an accomplished artist." The actress' next picture was the celluloid adaptation of Ruth Gordon's '43 successful comedy, *Over Twenty-one*, released in August 1945. On the whole, critics felt that the film did not compare favorably with the stage production, and they were divided on the merits of Miss Dunne's performance, thus: "a delightful comedy performance"; "the strong urge to ape Miss Gordon . . . becomes monotonous and distracting after a time." One of her pictures scheduled for 1946, as announced in December 1945, was expected to be the lead in Margaret Landon's '45 *Anna and the King of Siam*.

In 1936 Miss Dunne's husband, Dr. Griffin, gave up his dentistry in New York in order to join his wife in California. The Griffins had had to deny continual rumors of estrangement in the nine years of their "long-distance" marriage, during which they had seen each other only on vacations. Miss Dunne believes that she has been able to combine a successful career with a happy marriage because she and her husband have different vocations. Hollywood and movie-making, for her, have "always begun and ended on the set." She has few intimate friends in the motion picture colony, makes few public appearances, and has been described as "hard on interviewers" because of her aversion to personal publicity. At the studio she is said to be hardworking and cooperative, and is considered a shrewd business woman; at home she is Mrs. Griffin, "the gracious, charming hostess" and "a devoted mother" to her adopted daughter Mary Frances, who is called "Missy." Jerome Beatty says that Miss Dunne is "the sort of person who is never caught with her hair rumpled or in the wrong dress." The Griffins live in Holmby Hills near Hollywood, in a nine-room French Provincial home which is called "the Griffins' home," not "the Dunne residence." On weekends the actress likes to golf with her husband at Santa Barbara or Palm Springs, or entertain his business friends. The Griffins own various enterprises, among them the Griffin Wellpoint Company.

Described as a "regal beauty," the classic-featured star is five feet five inches tall, has reddish-brown hair and "warm" gray eyes. A fine complexion is considered responsible for the unusually pleasing close-ups of the actress. Miss Dunne likes to write music, to garden, play golf and badminton, and cook. She is an ardent baseball and football fan, and she especially likes the plays of Shaw '44 and Barrie. Her extravagances are perfumes, some of which she blends herself, and shoes. She made regular hospital visits to wounded servicemen during the war, to chat and to write letters for them, and it is said she enjoyed their tribute of "Hiya, pal!" and admiring whistles. As for her plans for retiring, she has said, "I guess I'll go on acting until I'm old and feeble and nobody wants to look at me any more."

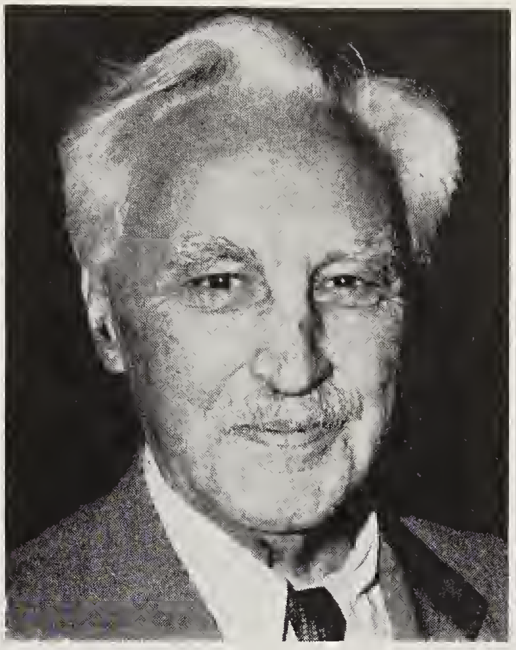
EATON, CHARLES A(UBREY) Mar. 29, 1868- United States Representative from New Jersey

Address: b. House of Representatives Office Bldg., Washington, D.C.; h. P.O. Box 126, Plainfield, N.J.

New Jersey's Representative in Congress since 1925, Charles A. Eaton, was named by President Roosevelt '42 to serve with the American delegation at the United Nations conference at San Francisco in April 1945. The senior minority member of the House Foreign Affairs Committee, the Republican Congressman has taken an active part in foreign affairs problems for many years as a stanch advocate of international cooperation. Before election to Congress he was for twenty-six years a minister of the Baptist Church. The Congressman also has been a newspaper correspondent, an editor, and a sociologist, specializing in industrial relations. He is described as a man of "commanding personality" and broad human sympathies.



CHARLES A. EATON

The son of Stephen and Mary Desiah (Parker) Eaton, Charles Aubrey Eaton was born March 29, 1868, in Cumberland County, Nova Scotia, Canada. There he was educated in the high schools of Truro and Amherst and at Acadia University, where he received his B.A. in 1890 and his M.A. three years later. The young man then continued his studies at Newton Theological Institution in Massachusetts (graduating in 1893), and at McMaster University in Toronto, Ontario (M.A. 1896). (Eaton has received a D.D. degree from Baylor University in 1899, from Acadia University in 1907, and a LL.D. from McMaster University in 1916.) He was ordained in the Baptist ministry in 1893, becoming pastor of the First Church, Natick, Massachusetts, shortly thereafter. In 1895 Eaton assumed the pastorate of the Bloor Street Church in Toronto, where he remained for five years. It was in June 1895 that he was married to Mary Winifred Parlin. The couple had six children: Marion Aubrey, Margaret Evelyn, Frances Winifred, Charles Aubrey, Mary Rose, and Catharine Starr.

In 1901 Eaton's ministerial duties took him to the United States, to Cleveland, where he became pastor of the Euclid Avenue Church. From his Cleveland post Eaton was transferred in 1909 to New York's Madison Avenue Baptist Church. During these years, in addition to his clerical duties, Eaton indulged his liking for journalism. From 1896 to 1901 he was sociological editor of the Toronto *Globe*. In 1899 he also became associate editor of the *Westminster*, a monthly magazine published in Toronto. In addition, Eaton held the position of special correspondent for the New York *Tribune* and the Boston *Transcript* from 1897 to 1901. At one time the busy clergyman also acted as special correspondent for the London *Times*.

During the First World War Eaton won respect as a speaker and worker for the Allied cause. He served as head of the National Service Section of the United States Shipping Board, Emergency Fleet Corporation, engaged

EATON, CHARLES A.—*Continued*

in increasing the production of ships. This vital production role brought him into close contact with capitalistic and labor groups. During the stormy industrial era following the war Eaton endeavored to apply his knowledge of industrial relations toward improving living conditions. In July 1919 *World Outlook* published his article, "Labor's Stake in Capital." In a brief analysis of the relationship of capital and labor, Eaton declared: "The way to establish good will in industry is to make every man associated with that industry consciously and gladly a part of the entire organization." The pastor-sociologist made another significant statement that after some twenty-five years is still timely. "If the war has taught the world anything, it is that the destinies of men and nations are determined by what they are in their minds and hearts. If the war has decided any issue, it is that the whole world must adopt the principle of democracy in the entirety of its life."

Another article by Eaton appeared in the January 1920 issue of *World Outlook,* "What Is Wrong in the Industrial World." In his discussion of this theme, Eaton declared, "I have no theory to exploit and no party to advance. I interpret life from the point of view of its universal and spiritual aspect." He went on to consider the practical steps essential to improved industrial relations: "Industrial relations are human relations. . . .They are the vital moral relationships between living men described as capitalists and other living men described as laborers. . . .This man-to-man relationship . . . implies a sense of obligation toward each other." In his summation of the demands of the worker, he said that the American worker is aiming at "the betterment of his social and economic condition." Eaton is the author of two religious works, *Troubled Hearts* (1899) and *The Old Evangel and the New Evangelism* (1901). The pastor is also well known as a lecturer. He has visited England and the Continent many times and has preached several seasons in prominent London churches. His lectures were noted for their "beautiful imagery, clear reasoning, and brilliant wit."

Deeply interested in the problems of labor, Eaton resigned his pastorate of the Madison Avenue Baptist Church in 1919, to devote his time to this work. He became head of the industrial relations department of the National Lamp Works of the General Electric Company, in New Jersey; he has been editor of the company's publication, *Light,* since 1923. Eaton was first elected to Congress from the Fourth New Jersey District in 1925. From that time on he has retained his Congressional seat, representing the Fifth New Jersey District since 1933. The former minister is one of the leaders of the Republican Party, but in Congress his adherence to party lines has not been strict; he did not maintain an attitude of complete opposition to the Roosevelt Administration as did many of his party colleagues. On foreign policy Eaton followed the White House rather closely. This situation led one writer to call Eaton "something of an exception to the general run of violent anti-New Deal feeling among House Republicans."

Eaton occupies an important position as ranking Republican member of the powerful House Foreign Affairs Committee. In February 1943 the New Jersey Representative was among the Congressional leaders at the White House conference at which President Roosevelt revealed the secret offensive war plans for 1943 mapped at the Allied conference in Casablanca. In September of that year Eaton played a prominent role in Congressional debate on the Fulbright '43 resolution. He said tersely: "The question is just this, do we want to substitute law for force in world affairs? If we do, then the United States must participate. And if the United States is to participate, then Congress must say so." Thus Eaton strongly endorsed the Fulbright measure, declaring, "The problem is a challenge to the family of nations to do what the states of this Union have done." At one point during the lengthy debate on the resolution Eaton rose and told the half-empty House, "What are we fussing about here when we haven't enough interest to fill these seats and when we do fill them we sit around and gab and gossip like a bunch of old women at a sewing party? If we haven't enough interest, we should get out and give room for some decent people who have a sense of responsibility about these issues which will be here a hundred years from now." As the white-haired Republican continued his address the seats of the chamber were gradually filled, and when Eaton finished his speech the entire House rose in tribute.

The Republican Congressman voted for such measures as Lend-Lease, naval expansion, and the United Nations Relief and Rehabilitation Administration. During the debate on UNRRA Eaton was one of the vocal defenders of the relief measure, leading the Republican "cheering section" in its favor. Urging approval of the bill, he stated, "The object of this legislation—and do not forget it—is to help those people help themselves. . . .We cannot be a healthy nation surrounded by a sick world."

Eaton's Congressional record indicates, however, that his opposition to the New Deal's domestic policies was consistent. He voted against the WPA in 1939, the NYA in 1940, and against the rural electrification program in 1943. Also, in 1943 he voted to override the Presidential veto of the Smith '41-Connally '41 bill and the income tax bill. That same year he registered his opposition to the President's $25,000 income limit (after taxes) by voting for its abolition. The Republican also voted against the food subsidy program and the Federal ballot bill for servicemen.

As a prominent Republican leader, Eaton served on the committee which drafted that party's declaration of foreign policy at Mackinac Island, Michigan, in September 1943. The following July, Eaton conferred with Governor Thomas E. Dewey '44 in Albany, discussing politics and foreign affairs. After the meeting Eaton stated that he and Dewey agreed that America must take an active part in postwar world affairs. Voicing his opinion on this issue, Eaton declared, "My view all my life has been that this is the greatest, most powerful nation in the world economically, and the possession of that power involves responsibilities we must discharge, and whether we like it or not, this nation must take its place of leadership in world affairs." Eaton added that he and Dewey also agreed that the United States has the responsibility of aiding in European rehabilitation. But he qualified this opinion: "As soon as we have discharged our humanitarian duty to the starving and homeless—and that we ought to do as a free gift, as we always have done in times of great calamity elsewhere—then, after that, we ought not to be the world's Santa Claus." Eaton is a member of the American Post-War Association, described as an "organization of internationalists."

From the wealth of his experience Eaton wrote an article for the New York *Times*, published in the Sunday magazine section of that paper on March 4, 1945. Under the title "A Member of Congress Looks at Congress," Eaton discussed the composition and operation of the legislative body. Writing as a veteran of twenty-one consecutive years of Congressional service, he analyzed the functions of this body in American life. Pointing out the forces influencing Congress, he stated, "It must be kept in mind that Congress is always representative of actively warring political parties and, in these enlightened times, is further bedeviled by an army of predatory pressure groups who think and act only in terms of their own selfish advantage. It is inevitable that each of these power and profit-hungry parties and groups should have few kind words for members of Congress who refuse, as many do, to jump when they crack the whip." Eaton further declared that "the members of Congress, in character, ability, and patriotism, are representative of the people who elect them. Regardless of party labels, they constitute a true cross section out of the upper and middle strata of our national life." The article also treated plans for Congressional reorganization—efforts to "streamline" Congressional procedure.

On February 13, 1945, President Roosevelt announced the membership of the United States delegation that would attend the United Nations conference in San Francisco, starting April 25. Secretary of State Stettinius '40 was named chairman, while Cordell Hull '40 was appointed senior adviser. The other members besides Eaton were Virginia Gildersleeve '41, Senators Tom Connally and Arthur Vandenberg '40, Representative Sol Bloom '43 and Commander Harold Stassen '40. The New Jersey Congressmen went to San Francisco a strong advocate of international cooperation and American participation in world affairs. When the Teheran declaration of 1943 was first made public Eaton hailed it as "one of the most momentous documents ever penned."

He is credited with having done much hard work on the committee dealing with general provisions, including membership, of the United Nations Organization. As the conference approached its close Representative Eaton thus summed up the sentiments of the American delegation in particular: "There were times when I thought we were in danger of building for primeval chaos. Now I really think we're getting somewhere on the road to permanent peace." In his report to the House of Representatives in July, the legislator said, "In my judgment, the San Francisco conference and the Charter as created, regardless of whatever imperfections it may develop in practice, is the greatest and most hopeful public event in history." Commenting on the American delegation, he added, "We represented as a sacred trust every white cross marking the burial place of every man and woman at every battle front who, like their Divine Redeemer, in saving others could not save themselves." Only a short time before he uttered these words the War Department had reported the death of his twenty-three-year-old grandson, Lieutenant Douglas Wilson Demler, Jr., of the United States Marine Corps, who was killed in action in May on Okinawa.

EDGE, WALTER E(VANS) Nov. 20, 1873- Governor of New Jersey

Address: b. State House, Trenton, N.J.; Press-Union Bldg., Atlantic Ave., Atlantic City, N.J.; h. Morven, Princeton, N.J.

Elected Governor of New Jersey on the Republican ticket in 1943, Walter E. Edge has attracted national attention for his sponsorship of progressive social legislation in that state, for his fight to secure a new State constitution, and for his vigorous opposition to the rule of Frank Hague, the Mayor of Jersey City and Democratic boss of Hudson County.

Walter Evans Edge is a Pennsylvanian, born in Philadelphia on November 20, 1873. His parents were William and Mary (Evans) Edge. He is a descendant of John Edge, who settled in the sixteen-seventies in Chester Valley, Pennsylvania, on a grant from William Penn. When he was a small boy Walter's family moved to Pleasantville, New Jersey, where he was graduated from grammar school at the age of fourteen.

His first job was as printer's devil on the Atlantic City *Review*, which he soon left for a position with the Dorland Advertising Agency, a small Atlantic City firm. (Later he was to become the owner of the agency and develop it into an international organization with offices in New York, London, Paris, Berlin, and Moscow.) When he was twenty-two Edge decided to return to the newspaper business. He started his own paper, the Atlantic City *Guest*, which later became the Atlantic City *Daily Press*. Subsequently he acquired the Atlantic City *Evening Union*, actively directing this publication and the *Press* for many years.

In 1897, when he was twenty-four, Edge began his political career by becoming a clerk in the New Jersey State Senate. After an interim, during which he fought in the Spanish-American War as a lieutenant in the Fourth New Jersey Volunteer Infantry, he became secretary of the Senate (1901-4). In 1910 he was elected to the New Jersey Assembly, becoming Republican leader in the State Senate (1911-16).

With his election to the governorship in 1917, Walter Edge brought his state into a position of national prominence. Progressive in outlook, he is considered as having instituted sound business and social legislation, and was respon-

Underwood & Underwood

WALTER E. EDGE

sible for the first workmen's compensation and employers' liability law in the State. He pioneered with the "pay-as-you-go" policy in New Jersey's public affairs, he consolidated State penal and charitable institutions, and he reorganized other departments for greater economy and efficiency in administration. He also sponsored the legislation which laid the basis for New Jersey's present State highway system, and for the construction of the Holland Tunnel and Delaware River Bridge.

Governor Edge resigned from his office in 1919 after his election to a seat in the United States Senate. (At the end of his six-year term he was re-elected.) During his years as Senator Edge backed much social legislation and adhered to the tenets of sound business practices in government. In 1929 he again resigned from an office, this time to accept the post of Ambassador Extraordinary and Plenipotentiary to France, a post he held until 1933. He is said to have won the admiration and respect of the French people, and he was instrumental in negotiating several trade treaties and economic agreements.

After some thirty years in public office Ambassador Edge retired to private activities. In the role of an elder statesman of the Republican Party, he continued his interests, however, in political affairs. His party regularly selected him as delegate at large to each national convention, and he took an active part in every campaign. In 1939, when repeal of the arms embargo was before the United States Congress, he insisted that all possible aid be given the Allies. He was keynote speaker at the New Jersey State Republican Convention in 1940, the year Charles Edison '40 was running for Governor on the Democratic ticket. "If Charles Edison is a good Secretary of the Navy," commented Edge, "he should stay in that post as a patriotic duty. If he isn't, he's not good enough to be Governor of New Jersey." Edge also defended the Republican Party from the charges of President Roosevelt '42 that the party in 1933 had left the Army and Navy at its lowest ebb: he maintained that both parties had at that time directed every effort toward disarmament.

Three years later, with his country at war, the sixty-nine-year-old Edge found himself supported by New Jersey Republicans for the party's gubernatorial nomination of September 1943. He had emerged as the only candidate about whom most elements could rally, and he himself had expressed a desire to return to public office, prompted, he explained, by an aversion to being idle while great issues, raised by the war, were at stake. Leading Republican papers put themselves enthusiastically behind his candidacy, the New York *Herald Tribune* commenting that he possessed "initiative, energy, and the gift of leadership."

Mayor Hague and his supporters exerted every effort to find a strong candidate to oppose Edge. Mayor Vincent J. Murphy of Newark was finally chosen, but the campaign was one of Hague versus Edge. Said the Republican candidate: "I deprecate the effort being made by the opposition during this campaign to place labor on the bargain counter; to command labor to vote en masse for my opponent because he happens to be an official of a labor organization. . . .Those who seek to divide us here on the home front are guilty of a grave disservice to the Nation in the hour of its greatest crisis." Mayor Murphy, on the other hand, accused Edge, among other things, of appeasement and isolationist views. It was this charge which Wendell Willkie '40 called "ridiculous." He declared that as far back as 1919 Edge, in a speech in the Senate, had warned that the United States could not hold aloof from the problems of the world, that the airplane had destroyed America's isolation. Willkie recalled that the Republican had "fought vigorously [in 1940] against the attempts of noninterventionists to attach the so-called 'peace party' label to the Republican Party."

During his campaign Edge promised many social reforms, plans for State aid in the postwar employment of veterans, and revision of New Jersey's outmoded hundred-year-old constitution (a reform which he had helped Governor Edison push through the legislature). In addition, he stated his belief that "a new period of international cooperation is necessary to avert future world catastrophies."

Despite the big Democratic vote turned in by the Hague machine, Edge was elected to the governorship of New Jersey by an approximate plurality of 128,000 votes, the largest for a winning candidate since 1931. Moreover, the Republicans maintained their control of both houses of the legislature, with electoral approval of revision of the constitution for the first time in ninety-nine years. The Edge victory was hailed as a big blow to Hague—the worst defeat in his long career as political czar of the State. Former Governor Edison praised the large affirmative vote for constitutional revison as "proof that democracy works."

At his inauguration on January 18, 1944, Governor Edge, after stressing that the war program should not be impeded by strikes, outlined some of the desirable features proposed for the new constitution: a unified court structure; an extension of the governor's term to four years (to become effective with the next governor); the powers of the office strengthened to make the executive the actual head of the State government; a revised legislative section that would extend the Senate term to four years and the Assembly to two, with an increased compensation; and the improvement of fiscal procedures with a single State budget embracing all revenues and expenditures of the State.

The new Governor also promised speedy action to remedy the vote-getting irregularities in Hudson County. He recommended legislation requiring the installation of voting machines throughout all counties where such irregularities were reported. But it was a proposed drastic change in the State's judiciary system which would most affect Hague. A state-wide superior court would absorb the several existing district courts, all of which would considerably damage the prestige of Hague as a patronage dispenser. (In 1944 a bill for an independent grand jury was passed through the legislature at the behest of Edge. There still remained to be corrected, however, other recognized glaring defects of the antiquated judicial system.)

The new constitution, drafted by a committee of thirty members of the legislature, all Republican, was submitted to the legislature on January 25, 1944. Arrangements were made for public hearings to be held before a final draft was submitted to the people for ratification or rejection at the general election that November. In his annual budget message in February, Governor Edge proposed that a fund of $25,489,504 be set aside for postwar needs. Moreover, determined that his legislative program should be translated into law before he began distribution of patronage, Governor Edge "permitted the patronage log jam to continue," much to the disappointment of a large element in his party interested in political jobs.

On February 23 a soldier-vote bill, described as "much more liberal than that of any other state," was signed by Governor Edge. The law gave members of the armed forces and organizations such as the Red Cross, the merchant marine, and the USO an opportunity to vote for candidates for local, county, State and Federal offices. Edge did not wait for the Adjutant General's Department to compile the addresses of military personnel. Instead, he enlisted the aid of air-raid wardens and various organizations to make a house-to-house canvass to obtain the service address of every New Jersey resident in the armed services. And, although he believed two types of ballots would be confusing, he informed Roosevelt that New Jersey would authorize the use of the Federal ballot.

During the next few weeks the Governor worked for the passage of many important bills. He initiated a bill to reform the administration of State civil service. He signed bills to create a State department of taxation and finance; to provide State guaranties of loans up to three thousand dollars to veterans wishing to borrow funds to set themselves up in business or professions; to render illegal the practice of placing children for adoption on a commercial basis; to establish a State Department of Economic Development to deal with postwar problems. "During his first three months in office," commented the New York *Herald Tribune*, he gave "new life to the government of his state and new spirit to his party." Edge also instituted a program to consolidate the government departments, a program which affected about one hundred State agencies.

Interest early turned to the role of New Jersey in the 1944 Presidential election. Republicans had high hopes that the State, Democratic in the last two elections, would return to Republican allegiance. Consequently, Governor Edge was boomed for the post of convention keynoter—an honor which he declined. He also said that New Jersey delegates to the convention would go unpledged to the support of any one candidate. But he was convinced, he said, that the Republican Party would carry the Nation. In several speeches he demanded a firm anti-isolationist stand. "We can't pussyfoot on international responsibilities," he said. "When this war is won we cannot drop our arms and run away unless we are prepared to invite a third world cataclysm." In an address at Drexel Institute he reiterated his advocacy of compulsory military training after the war. At the early sessions of the national convention he renewed his demand for the removal of "weasel words" from the tentative declaration favoring United States participation in a postwar security organization. Edge said he would challenge the platform on the floor of the convention if it was less than outspoken in behalf of world organization. But although the plank as finally drafted by Senators Warren Austin '44 and Arthur Vandenberg '40 did not meet with his full approval, Edge said that since the Republican nominee, Thomas E. Dewey '44, had accepted it, he also would. "I have every confidence that Governor Dewey will enlarge and amplify the party's position on this foreign policy plank." During the next few months Edge led the Republicans of New Jersey in an all-out campaign for his fellow Governor from New York State.

Domestic issues in New Jersey were a more difficult matter. The Hague machine had been rallying its forces for the forthcoming election. When Edge said, "The public interest in primary elections has become so apathetic they might as well be abolished," the Hague men accused him of plotting to end the open primary law. Hague also began his attacks on what he called the "unscrupulous railroad lobby with the power of the Edge administration behind it," which would "rob the people of every municipality in the State of railroad-tax interest which the high court has said is due and owing." Hague faced the possibility that the State might deny him Jersey City's ten-million-dollar share in the interest involved, on the basis of a two-year-old Supreme Court decision in another tax case.

Charging that the proposed new State charter was "loaded with tricks," Hague renewed his attack upon constitutional reform. Edge accused him of making the issue a political one. Altogether, the campaign was quite bitter. Hague's argument that war veterans would not receive a fair deal under the new constitution induced a number of veterans' organizations to go on record against it. His charge that the constitution did not protect labor influenced

EDGE, WALTER E.—*Continued*

both the CIO and the A.F. of L. to oppose it. Farmers were led to opposition, likewise the New Jersey Civil Service. When the Teachers Association of Jersey City took its stand against revision, Edge accused Hague of using "Hitler Gestapo pressure." He charged also that Hague was making misrepresentations designed to influence Roman Catholics to vote against constitutional reform. "A new falsehood, a new lie, a new appeal to a religious or racial group each day is Hague's answer to the many advantages for every citizen presented in this new constitution," said Edge in October. "During the last few weeks we have experienced one of the most vicious and unprincipled campaigns to sabotage a great public movement ever undertaken."

On November 7, 1944, the voters of New Jersey decided against the revision of the constitution. They also decided that they wanted President Roosevelt for another four years. It was a double triumph for Democratic Mayor Hague and his machine; and the rejection of the constitution was a keen disappointment to Governor Edge. The number of votes cast was larger than it had been in 1940, despite the fact that the Governor had declined the request of labor officials to extend the voting time. It was noted that in the wards in Jersey City, however, where voting machines had been installed for the first time, the Democratic vote was considerably lighter than it had previously been.

In spite of the November setbacks, Governor Edge was determined to carry on his reform program. When the New Jersey Legislature met in January 1945 he presented a fourteen-point program calling for broad reforms in the State government, and also promised that new plans for a revised constitution would be made. The new program included plans for much-needed improvements in the New Jersey highway system, liberalization of workmen's compensation and unemployment benefits, better regulation of migrant farm labor, strengthening of the Election Act, and adoption of a formula for suitable distribution of railroad-tax interest.

The stern warning of the Governor that he would not submit to legislative or other dictation in filling offices brought forth a good deal of criticism not only from the Democrats, but from some Republican members of the legislature. Indications were that, although the legislature was Republican-controlled, Governor Edge would find rougher sledding for his recommendations in 1945 than he had in 1944. Hague and his organization renewed the fight against Edge over the rail-tax funds; but the bills as proposed by him were passed despite Hague's opposition. When the matter of cheaper rates in transportation facilities by the Port of New York Authority (operating the Holland and Lincoln tunnels from Manhattan to New Jersey) came up, Hague supported the continuance in office of Frank Ferguson, president of the Hudson County National Bank, as Port Authority chairman. Under Ferguson, according to *PM*, pleas of motorists for a reduction in tolls have been ignored, "but, meanwhile, the Authority has continued to roll up surpluses tucked away in 'special reserves.'"

In the spring of 1945 the Governor signed other new laws: introduction into high schools of a required two-year course in American history and democracy; a reorganization of the State Board of Labor Mediation which increased the membership from five to seven; creation of a commission to deal with alcoholics as sick rather than as immoral persons; creation of a single general State fund and a single appropriations bill; placing in the general fund of the State treasury all interest on delinquent railroad taxes; liberalization of specific housing standards for migrant labor camps in regard to sleeping, health, eating, and recreational facilities. Said the president of the State Federation of Labor: "We have gotten more and better labor legislation during Governor Edge's term of office than we have under any other governor of New Jersey."

One measure which received divided comment upon passage that spring was the series of seven bills banning racial and religious discrimination in employment, schools, municipal hospitals, hotels, and places of entertainment. *PM* called the fair employment measure a crippled bill which incorporated "none of the amendments demanded almost unanimously by New Jersey civic, labor, political, religious, and Negro groups." The New York *Herald Tribune*'s comment was that the bills "translated vital principles of social justice into statutory form. Their weakness lies in the severity of their provisions. Under these laws discrimination would constitute a misdemeanor. Whether grand juries will indict . . . is questionable. The laws will prove of little practical benefit if unenforceable."

At the Governors' Conference which was held at Mackinac Island, Michigan, in July 1945, a committee of nine state governors was organized in an attempt to cope with the Nation's food shortage. Governor Edge was named chairman of the committee, and announced that the first move would be to get all figures on purchases, stocks, and requirements directly from the military agencies, Lend-Lease, United Nations Relief and Rehabilitation Administration, and the Maritime Service. In September, turning his attention to problems of reconversion after the fall of Japan, Governor Edge announced that New Jersey was ready to spend from seventeen to twenty million dollars in immediate public improvements to relieve unemployment. He added, however, that he expected private industry to do most of the work in absorbing unemployed workers. For the housing shortage, especially as it affects the needs of returning veterans, Edge, in October, recommended relaxation of municipal zoning restrictions to permit conversion of large dwellings into multi-family units.

Governor Edge was married to Camilla Loyall A. Sewall in 1922 (his first wife, Lady Lee Phillips, died in 1915). He has four children: Walter E. Edge, Jr. (by his first wife), in service with the Army Air Forces; Camilla Sewall, who in 1944 was married to Edward B. Lee, Jr.; Mary Esther, who has worked with the Women's Land Army; and Loyall Howard. In December 1944 Governor and Mrs. Edge moved from Ventnor, New Jersey, into Morven, an historic house near Princeton, which the Governor had purchased to present to the State for use either as a governor's mansion or an historic shrine. It was in 1944 that Governor Edge announced that New Jersey—in addition to progressive social legislation—had another improvement: The State, he said, need no longer be known as the "Mosquito State," because "almost miraculous progress" had been made by an extermination commission. By gubernatorial proclamation, New Jersey would again use its official name, the "Garden State," taking for its emblem the violet.

ELMAN, MISCHA (mē'shȧ) Jan. 20, 1891- Violinist

Address: b. c/o Bernard R. La Berge, Inc., 119 W. 57th St., New York City; h. 101 Central Park West, New York City

Mischa Elman has been a violin virtuoso for more than three decades. Since making his musical debut as a boy of thirteen, the Russian-American artist has given more than three thousand concerts throughout the world. Today, with more than two million Elman records in circulation, it has been said that at every hour of the day this interpreter of Brahms, Beethoven, and Mendelssohn is being heard by music lovers somewhere. He is likewise acclaimed for his interpretation of a concerto by the Czech modernist Bohuslav Martinů '44.

Born in the ghetto of Talnoye in the Russian Ukraine, on January 20, 1891, Mischa Elman is the grandson of a concert violinist and the son of Saul Elman, a teacher of religion, who played the violin for diversion. Mischa's two sisters were also musical. The musician has said of his father, "He had more influence on me than any other human being. He traveled with me every minute until I was twenty-one, and, until he died [in 1940], was in complete sympathy with everything I did." At the age of four little Mischa began the study of the violin under his father's instruction. A year later the Countess Orosova invited him to give a private performance. Impressed by the boy's unusual talent, she engaged an experienced teacher for him. The first honor of his career came a few months later: He won a scholarship to the Odessa Imperial Academy of Music, where he was to study for five years under Fiedelmann.

In 1902 Leopold Auer, violinist to the Czar and Russia's most noted teacher of the violin, used his influence to gain the boy's admission as a free pupil to the St. Petersburg Conservatory, where he himself taught. Under Auer's guidance Mischa frequently played in the palaces of the nobility. On one of these occasions the Grand Duke of Mecklenburg-Strelitz gave the boy his first fine violin, an Amati.

Following a successful concert of Mischa's at the St. Petersburg Conservatory in 1904, Auer arranged for his thirteen-year-old pupil's debut in Berlin in October of the same year. It was an event that might not have taken place. "In my native Russia," related Elman in an *Etude* article, "we were quite definitely poor." When he went to the German capital he and his father had their first experience of living in a hotel. "That was the first time I had seen gaslight, and it was an event to have it in my own room, quite as rich people did." Not knowing how to turn off the gas completely, the boy almost fatally asphyxiated himself the night before his concert. When he stepped before the audience, Elman recalls, he felt giddy and ill, but he played with that "curious surcharge of energy that sometimes flames up in sick people." The program included Tchaikovsky's Violin Concerto, Bach's *Chaconne,* and other works of the classical concert repertoire. He got through all but the final group before he collapsed on the stage—but "the critical, discriminating audience of musical Berlin" acclaimed him one of the greatest of child prodigies. Concert dates in other German

J. Abresch

MISCHA ELMAN

cities followed. The great conductors Nikisch, Hans Richter, and Fiedler praised him; Joseph Joachim, the noted violinist, added his enthusiastic approval.

After a series of public appearances on the Continent, Mischa Elman soon made his debut in London. Acclaimed as a musical genius, the bushy-haired, blue-eyed youth became the idol of London society. It was at a command performance at Buckingham Palace that he met Caruso and their friendship began. At the concert King Edward had asked young Elman his opinion of London. To the amusement of the King and Caruso, who was standing near-by, the young violinist made no reference to his musical triumphs—it was the London bobbies who had delighted the boy. When Elman later went to the United States for his American debut, the two artists became close friends, and the phonograph records they made together are collectors' items today.

Elman's first American appearance, as soloist with the Russian Symphony Orchestra in New York on December 10, 1908, was a sensational success. The occasion, many critics said, marked his transformation from a child prodigy to a mature artist. Despite the fact that he was only seventeen, he impressed some of the critics to the extent that they classed him with Joachim and Ysaye. The connection, said Reginald de Koven in the New York *World*, "is obvious—marvelous and dashing interpretation is characteristic of all three of the artists." Critic James Huneker, while praising Elman's "amazing technical precision" and "still more amazing emotional temperament," was of the opinion that the violinist's conception of Beethoven was "neither as erudite as Kreisler's '44, nor as fascinating as Ysaye's."

After the Russian violinist's first recital at New York's Carnegie Hall the same month, Richard Aldrich, critic of the New York *Times*, observed that although Elman appeared to be trying to cast off his reputation as an infant curiosity and was demanding to be heard as an artist, "the shadow of his early exploitation as a prodigy lies upon his mature artistry, to its injury and disadvantages. There are serious defects in his playing," continued the critic, "that prevent him from taking the position of a truly great artist. He is too apt to force the note of pathos, of sentiment, of 'expression' generally." On another occasion the same critic commented, however, that there had been much to be admired in the performance: "the beauty and poignacy of the tone, the elasticity of the bowing, the clean precision of the left hand, the brilliancy that lightened it all."

Some years later James Huneker wrote of Elman: "United to an amazing technical precision there is a still more amazing emotional temperament all dominated by a powerful musical and mental intellect that is uncanny."

And later critics gave Elman a high standing; according to the distinguished critic Olin Downes '43, "in several respects, there is no other violinist who rivals the magnificent stamina, breadth, and vitality of his art today," and none who gives certain music, specifically the Vitali-Charlier *Chaconne*, "a grander arch, a dignity, and distribution of detail." One reviewer complained that the violinist seemed "enamored of his own tone" and tried to improve on the work of a master; but Arthur Berger of the New York *Sun* holds that Elman's playing "continues to acquire new depth, directness, and musicality" after more than thirty years as a leading concert artist.

The veteran musician has appeared during his career as soloist with the major American and European orchestras. He has toured the world many times and was the first international artist to make concert appearances throughout the Far East. Generous in contributing his talent to benefit performances, in one year he made a coast-to-coast tour of the United States, giving twenty-six concerts to raise funds for the relief of refugees of all faiths. He also played frequently during the Second World War at service camps. His plans for the future include a tour of the Soviet Union and an appearance in Czechoslovakia to play a concerto which the Czech composer Bohuslav Martinů wrote expressly for him. Elman gave this work its première at a Boston Symphony concert at Carnegie Hall in January 1944—and the violinist's first essay into the field of contemporary music was acclaimed in the musical world.

The virtuoso does not object to "boogie-woogie." "To protest today against swing and jazz," he has said, "is as silly as it was for our grandfathers to protest against the waltz. Swing is just a social expression of our city youth and is a good outlet for their energies and emotions. It is no more to be deplored than the breakdown dances, let us say, in the country." He also pointed out that jazz supplies "the one remaining free improvisatory factor in the whole of music, and, as such, as every good musician knows, holds untold possibilities for the creative music of the future."

Since Elman has been continuously popular with American audiences (in his first season in the United States he played twenty-two concerts in New York and seventy throughout the rest of the country), he has made New York his home, and in 1923 became a naturalized citizen of the United States. Two years later he was married to Helen Frances Katten, whose wedding gift to him was the Madame Recamier Stradivarius (In addition to that instrument and the Amati, he also owns the Joachim Stradivarius.) The success of his marriage, says the violinist, is largely due to the fact that his American wife, although a music lover, "can't play a thing." Their daughter Nadia plays the piano but is ambitious for a theatrical career, while their son Joseph "fiddles strictly for fun." The Elmans live in a duplex apartment overlooking Central Park. Chess is one of Elman's hobbies. In appearance he is short, round-faced, and bald; and an outstanding trait of his personality is his rich sense of humor.

His days follow a businesslike schedule: He rises at eight-thirty, and, like many businessmen, he eats breakfast as he reads the paper. He begins practicing at nine and his accompanist arrives at ten. The rest of the morning is devoted to rehearsal of the next concert. (His repertoire consists of over six hundred numbers.) Afternoons are devoted to business appointments. "In a career of over forty years," the *New Yorker* reported in 1944, "Elman has had only five regular accompanists, and he regards it as a tribute to his lack of temperament that he has remained friends with all of them. 'I do not understand this raging and screaming that some artists do,' he has said. 'If I am uncertain, my accompanist is uncertain. It is better that I scream at myself. Not that I ever do, of course.' "

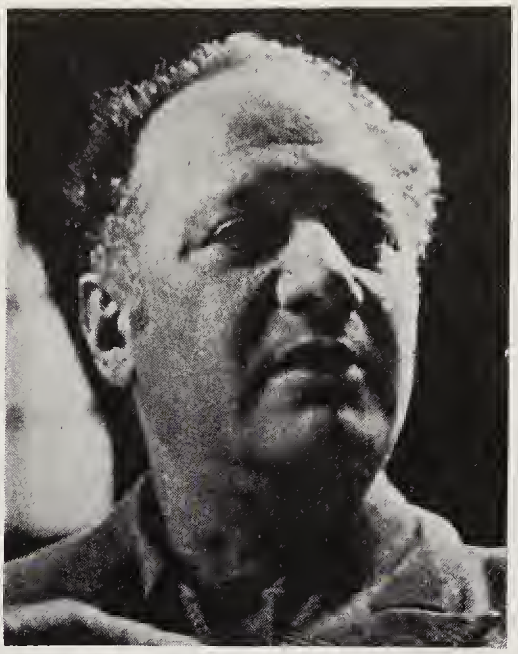
EPSTEIN, JACOB (ĕp′stīn) 1880- Sculptor; artist

Address: 18 Hyde Park Gate, London

Probably the best-known contemporary sculptor as well as the most discussed artist since Rodin, Jacob Epstein was born in 1880 in New York's Hester Street. He describes the neighborhood, the lower East Side, as "the most densely populated of any city on earth . . . and the sight, sounds, and smells had the vividness and sharp impact of an Oriental city." The Epsteins were not poor, however; the sculptor tells "they had prospered, and I can recall that we had Polish Christian servants who still retained peasant habits, speaking no English, wearing kerchiefs, and going about on bare feet." The third of a large family of Russian-Polish Jews, Jacob was "the sick one," and took little part in family or religious activities. He was intensely absorbed in reading and drawing; at school, the teachers were so impressed by his talent that they disregarded his inattention to mathematics and grammar. Jacob was something of a trial to his non-artistic parents, however, "going off to the woods with a book, and not turning up at meals."



JACOB EPSTEIN

When the Epsteins moved uptown to "a more respectable and duller part of the city," Jacob stayed on Hester Street, where he could see and draw from "the most diverse life of many lands." Around the turn of the century Epstein entered the Art Students' League school. Although he "felt like a fish out of water" there, the youth was able to keep himself going by selling his drawings for small sums, and attended concerts, opera, and endless political meetings, always as a spectator rather than a participant. As a relief for his strained eyes, he turned to sculpture. In 1901 Epstein went to work in a foundry for bronze casting, at the same time studying sculptural modeling at night under the distinguished sculptor George Grey Barnard. Although he was greatly impressed by Barnard, the young East Sider was dissatisfied with the possibilities for further study, and determined to go to Paris as soon as he could manage it.

At this time Epstein met the writer Hutchins Hapgood, who chose him to illustrate *The Spirit of the Ghetto* (1902), for which the publishers paid him four hundred dollars. He sold some drawings, also, to the *Century Magazine*, and with this money bought passage to Europe. Epstein writes that he went directly to France; but, according to Arthur Strawn, it was in London, where he lived on rice and tea in an old stable, that the burning-eyed young artist was introduced to Mrs. Hamilton Fish. Mrs. Fish, a wealthy American patroness of the arts, financed his study in Paris. It was "a most interesting period artistically . . . the rebels were just beginning to gain recognition at the expense of the Academicians." Epstein shared a studio with an old friend, and "hurled himself at the clay," avoiding all the usual Bohemian distractions. The American soon applied for admission to the Ecole des Beaux-Arts where he spent his mornings modeling from life, and his afternoons carving in marble and drawing from casts. Foreigners, he writes, were few and unpopular. After six months

EPSTEIN, JACOB—*Continued*

his refusal to run errands, according to custom, for the students who entered a certain competition, aroused so much hostility that he went over to the Julien Academy. According to Strawn, Epstein won some important prizes in Paris. While there he "worked in a sustained explosion of energy," destroying each study after a week.

After three years, finding himself at a dead end in his work, Epstein went to London, attracted by the "easy and natural manners and great courtesy" of the English, and the riches of the British Museum; and after a visit to America (traveling steerage), he took up permanent residence in England, eventually becoming a British subject. The penniless twenty-six-year-old was still working hard at his studies when, in 1906, he married a "charming and forceful" Scotswoman, Margaret Gilmour Dunlop, whom he had met in Paris. According to Strawn, the couple "occupied two bare rooms, one serving as studio. . . . To earn money Epstein served as model at an art school, posing three nights a week from six to ten, earning a dollar and a half a night."

In 1907 Epstein won his first important recognition. Queen Alexandra, consort of Edward VII, purchased his bronze *Head of an Infant,* and he modeled three other major bronzes. That spring, on the recommendation of the etcher Muirhead Bone, the young sculptor was commissioned by the architect Charles Holden to decorate the new British Medical Association building at the corner of Agar Street and the Strand. "I thought I was wealthy," Epstein recalls, "and the future looked bright. I could now pay for models and get to work on large figures." He moved into a large studio in Cheyne Walk, Chelsea, and began work on the eighteen figures of "free decorative conception . . . imaginatively expressive of spiritual and physical energy, concerned in some way with the seven ages of man . . . conceived in the grave heroic mood of pre-Phidian sculpture." In "a task probably unequaled since the Renaissance," Epstein made full-size clay figures of which plaster casts were taken; two assistants roughly shaped the seven-foot blocks of Portland stone built into the third story of the building; and then Epstein mounted the scaffolding and carved his figures, working for fourteen months under a tarpaulin in all sorts of weather.

When the scaffolding was removed from the first five nudes in June 1908, the *Evening Standard and St. James's Gazette* looked through a telescope and was shaken by one of the "periodic English fits of morality." It began an editorial campaign of denunciation which made the young sculptor's name a household word. The result was that the Strand was soon crowded with Londoners anxious to draw their own conclusions, artists and critics rushed to Epstein's defense, censorship groups opposed him, and the controversy occupied much space in the press. But Epstein was "made": "this unexpected hubbub in 1908," he says, "ushered me into a publicity I have always detested." (In 1935 the statues were removed by a new tenant on the excuse that the stone had decayed.)

After the Strand statues were completed, Epstein determined to "train himself in a more intensive method of working," and began a series of portrait busts, some of them commissioned. Several busts of Mrs. Epstein are said to be among her husband's finest work. One of the earliest celebrities to sit for him was Lady Gregory, the Irish playwright. Later Epstein sculptured more celebrities than any other English artist, but he tells in his autobiography that "the history of those portraits is for the most part a story of failure to please the sitters or their relatives." In view of the sensations caused by Epstein's other works, it is not generally realized that he has done far more of these vivid bronze portraits, and that they are universally described as powerful and sometimes as great. "From the standpoint of the purist amateur of sculpture," wrote H. R. Wilenski, "these bronzes violate all canons; they suggest color, and qualities such as sensuality, intelligence, stupidity, breeding, and underbreeding, which from classical standards are no concern of the sculptor's art. But even the purist must bow down before Romantic art of this compelling intensity." By skillfully exaggerating the natural difference between two sides of a face, Epstein achieves "miraculous" portraits which "seem to breathe and to have the soft mobility of flesh." The sculptor's "mastery of light" is often compared to that of Rembrandt, and it is said that the rough "mud-pie" finish he affects "creates shadows and heights in the face so that the bronze becomes flesh." Critics place him in the very first rank of portrait sculptors, although some have thought him an exponent of "Art for the Devil's sake"—that is, with all defects and evil qualities exaggerated at the expense of comeliness, charm, and goodness.

But it is Epstein's larger works, his carvings in stone, with which he is usually identified. Soon after doing the Strand figures, he was commissioned to execute a tomb for Oscar Wilde, to be installed in the Père Lachaise cemetery in Paris. In June 1912, after nine months of labor on a twenty-ton monolith, Epstein received "singularly favorable" comments on his "flying demon-angel." The same *Evening Standard* which had attacked the Medical Association Building frieze began its review: "Seldom in this country are we permitted to see such a dignified piece of monumental sculpture as Mr. Jacob Epstein has carved for the tomb of Oscar Wilde." But once it was installed in the cemetery, the same story of attack and defense was repeated in a French version. While Epstein himself was in South Africa carving some granite lions for Pretoria in the Transvaal, Frenchmen of prominence in the arts took up the fight, with petitions and protests. Eventually, after remaining covered until the outbreak of the First World War, the statue was unveiled without arousing comment.

Epstein's autobiography contains no mention of his war service; he remarks merely that he became the object of official investigation because he lived from 1913 to 1916 on the seacoast at Pett Level, which the authorities could not understand in "an alleged sculptor." His biographers mention "a short period of war service," but there is little authoritative information as to its nature and duration. The manuscript of the first book about him was lost when its author, T. E. Hulme was killed in battle in 1917; and so the first of a number of such works to be published was Bernard van Dieren's *Epstein*, in 1920.

The sculptor continued to do portrait bronzes, including those of Iris Tree and Admiral Lord Fisher; and he also decorated the first London night club, Frida Strindberg's Cafe Royal. In general, however, this was a period of experimentation for Epstein; he was interested in the Vorticist movement and turned out a number of extremely simplified and abstract carvings, including his flenite works and some bird groups. The most discussed of these experiments was the *Rock Drill*, which was never completed but which is admired by those who have written books on Epstein. His large marble *Venus*, exhibited in 1917, differs radically from the classic conception, being a slender, faceless, and completely unrealistic figure. This, too, is well regarded by Epstein's admirers, although Thomas Craven '44, who considers him a great sculptor, calls the Venus "a monumental absurdity." At this first one-man exhibition of his work, as the London *Observer* reported, the Venus "brought a shower of abuse down upon his head, but attracted to the Leicester Galleries thousands of people who under other circumstances would not have crossed the street to see a newly discovered masterpiece by Phidias or Michelangelo. They came to scoff at the Venus, but remained to worship, not indeed at the shrine of the goddess, but before the busts and other works in which the great sculptor had expressed his forceful personality."

The next Epstein sensation was created by his bronze *Christ*, modeled from Van Dieren and exhibited in 1920. This gaunt, beardless figure, more than life-size, stands wrapped in its winding sheet, pointing accusingly with one huge hand to the wound in the other. "In this work," says Epstein, "I realized the dignity of man, his feebleness, his strength, his humility, and the wrath and pity of the Son of Man." To the sculptor's amazement, the statue was attacked by the press, the clergy, Royal Academicians, artists' associations, and social bodies, and it aroused the fury of "the man in the street." "Gross and grotesque thing . . . offending and hurting caricature" were the words with which one churchman condemned the figure. The defense was led by Bernard Shaw '44, while "critics and artists were giving it an unusual unison of approval as a noble and sincere and powerfully dramatic work of art." Eventually it was bought by Apsley Cherry-Garrard and removed from view.

Five years later similar excitement was caused by Epstein's design for a memorial panel to W. H. Hudson, author of *Green Mansions*. This stone carving, made in seven months, was set up in Hyde Park. Immediately the *Morning Post* and the *Daily Mail* demanded the panel's removal, and one shabbily clad man spent twelve hours a day before the memorial, denouncing it. "For a whole summer troops of Londoners and provincials wore the grass down into hard, beaten earth in front of the monument, seeking the obscenities that did not exist." Thirteen prominent persons signed a petition demanding its removal, which was supported by many others, and the Home Under-Secretary was questioned about it in Parliament. The fight for keeping it was led and won by Sir Muirhead Bone, Bernard Shaw, and R. B. Cunninghame Grahame; but the work has several times been daubed with paint or tar by vandals.

Even Epstein's many portraits of his little daughter Peggy-Jean did not escape condemnation: some reviewers deplored the thought that so charming a child should grow up to be like Epstein's adults. The sculptor, who likes to work from children in spite of the strain of keeping them in pose, has also done a great many drawings and some statues of his son Jackie. Two of Epstein's large bronzes, *The Visitation* (1926) and *The Madonna and Child* (1927)—modeled from an Indian mother of the Moslem faith—were purchased by the National Art Collection Fund for the National Gallery of British Art. Epstein's drawings have always sold more readily than his sculptures—for thirty-odd pounds, as compared to two and three hundred pounds for a bust—and in 1929 seventy-five of his drawings of nudes and seminudes, made between July and October 1928, were printed in a limited edition selling for fifteen pounds. Epstein's drawings and paintings are made with great facility, and he has pointed out that he could earn much more if he were to devote himself to pictures instead of to the time-consuming labor and the expense of sculpture.

Epstein continued to make a sensation every few years. In 1929 it was again some architectonic sculptures commissioned by Charles Holden—groups called *Day* and *Night* for the Underground (subway) Headquarters Building. Again there was furious attack and ardent defense. In 1931 it was his *Genesis*, a huge nude marble mother, that shocked beholders, and in that year, too, his Old Testament illustrations were attacked as blasphemous. Like all his drawings, the illustrations sold well.

Epstein's *Primeval Gods, Sun God* panel, and fifty paintings of Epping Forest were well received in 1933; but his biennial sensation was provided by another carving of Jesus, the colossal *Behold the Man*, carved in stone so tough all Epstein's tools broke on it. This figure, which stands twice as high as its creator, is extremely simplified, with a huge head; and it aroused a storm of protest, extending not only to religious bodies but to Parliament and the Royal Navy. After this Epstein again turned to the graphic; asked to paint twenty flower pictures by some Dutch dealers, he painted three hundred and sixty. Some persons were outraged even by these gouaches: David Cohn writes that it is "because even the simple field-daisy under his hand glows with a strange light, and delphiniums become mauve-blue cathedral spires. His flower drawings are indeed shot through with some of the almost demonic vitality that appears in his bronze portraits, so that his sunflowers burn like a tropical noon, and his massed poppies seem warm to the touch." In 1937 Epstein also illustrated his jeweler friend Moysheh Oyved's *A Book of Affinity* with seven water colors.

In 1937 came his third sculpture of Christ, a recumbent pink alabaster figure called *Consum-*

EPSTEIN, JACOB—*Continued*

matum Est. Like the others, it drew bitter attack and high praise. Lesser denunciation was inspired by his sixty drawings for Baudelaire's *Les Fleurs du Mal*, commissioned by the Limited Editions Club. Then, after thirty years in the public eye, Epstein produced yet another shock, his seven-foot ape-like alabaster colossus, *Adam*, exhibited in 1939, which "pained the critics and maddened the coteries," although some found it "strangely impressive." *Adam* was purchased by an Australian collector for a reputed seven thousand pounds (Epstein says the price was less than a quarter of that amount for his fifteen months' labor) and exhibited at a seaside amusement place, where more than a million persons paid a shilling apiece to see it. When it arrived in the United States for a tour to raise money for bombers, one New York tabloid suggested, "Why not just bomb Berlin with *Adam*?" Up to 1946 Epstein had not produced another controversial piece—his *Jacob and the Angel* was well received.

Jacob Epstein had refused in 1931 to take time to write a book, although he had allowed Arnold Haskell to piece their conversations together into *The Sculptor Speaks.* But in 1940 he wrote an autobiography, *Let There Be Sculpture*, with a full account of the controversies aroused by his various works. The book makes it clear that Epstein, far from aiming to shock, was hurt and surprised each time by the reception accorded his work. "I have always sought the deeply intimate and human," he declares, "and so wrought them that they became classic and enduring. . . .I do not see myself as a martyr, but what has always astonished me was the bitterness of the attacks on my statues." Epstein feels that he has been deliberately neglected in many ways, pointing out that he has never been asked to teach, that he has never received any honor except an LL.D. from Aberdeen University in 1938, that he seldom has been commissioned by architects and never by public bodies. He says: "How superficial is the world of art, and what a wretched lot of logrollers, schemers, sharks, opportunists, profiteers, snobs, parasites, sycophants, camp followers, social climbers, and . . . 'fourflushers' infest the world of art—this jungle into which the artist is forced periodically to bring his work and live."

The sculptor detests "artiness," and in 1927 began listing prices in his exhibition catalogues, saying that his work became merchandise as soon as it was put on display. If he were free from the necessity of earning a living, the sculptor says he would choose to live in the country and model only from children; as it is, he must stay in London to be near the galleries and obtain commissions. He says that his sculptures of persons "who might mean something historically are few and accidental." These persons included the writers Bernard Shaw, Joseph Conrad, Emlyn Williams, Sir Hugh Walpole, and J. B. Priestley; stage personalities Paul Robeson '41, Dame Sybil Thorndike, Harriet Hoctor, and John Gielgud; and figures like Albert Einstein '41, Ramsay MacDonald, Lord Beaverbrook '40, John Dewey '44, and the Russian Ambassador Ivan Maisky '41.

After the British elections in August 1945 the War Artists' Advisory Commission commissioned Epstein to do a bust of the new British Foreign Secretary Ernest Bevin '40. In September *Time* carried a photograph of the sculptor standing beside the clay model of his latest work, with the comment, "The head looked like a broad-ax approximation of the rough-and-ready Britain's Foreign Secretary, but, like all Epstein portraits, it had a lot of Epstein in it, too."

Epstein is described as short, bold-featured, carelessly dressed, "a big and powerful man radiating enormous vigor and the impression of almost inexhaustible physical energy. His torso is huge, his neck strong; his gray eyes are sad, his sensitive, tortured lips never quite still. He suggests at once Michelangelo and William Blake." The lack of humor with which he has been charged is refuted by his friends, who say he is "a superb talker and widely informed, but does not monopolize the conversation." He is keenly responsive to music, especially that of Bach and Beethoven. He works for long periods with intense concentration, says he does not know or care who is Prime Minister or what the weather is like at such times, and never answers his fan mail.

EVANS, LUTHER H(ARRIS) Oct. 13, 1902- Librarian of Congress

Address: b. Library of Congress, Washington, D.C.

In June 1945 President Harry S. Truman '45 appointed Luther H. Evans, then Chief Assistant Librarian of the Library of Congress, the tenth Librarian of Congress. By this promotion Evans became the director of the 145-year-old institution, the holdings of which consisted (as of mid-1943) of more than six million books and pamphlets, one and a half million maps and charts, approximately the same number of volumes and pieces of music, more than half a million prints, and "uncounted millions of items of manuscript material." As the depository of all books copyrighted in the United States, through which its accessions grow annually by about one quarter of a million titles, the Library of Congress serves members of Congress and Government departments, offers rich research facilities, and provides bibliographic and interlibrary loan service to libraries throughout the country. More particularly, and recently, it supplied General MacArthur '41 with some of the information he needed for his contacts with the Philippine underground.

Luther Harris Evans was born October 13, 1902, the son of Lillie (Johnson) Evans and George Washington Evans, a maintenance of way section foreman for the Missouri, Kansas and Texas Railway. Luther was born at his grandmother's home on a farm near Sayers (or Sayersville) in Bastrop County, Texas, but very shortly afterward his father moved the family to a railroad section foreman's house near Sayers; later they moved to a house in the town. In the fall of 1908, when Luther was six, his father bought a farm (still in the family's possession) adjoining that formerly belonging to the boy's grandmother. On a piece of ground between the two farms the Cedar Grove School was erected, and it was there in 1908, in the one-teacher school, that he began his education, attending for six months of each year for the next twelve years. The remainder of his time was occupied by farm chores and in helping to care for eight younger brothers and sisters. After completing the tenth grade the youth entered Bastrop High School. He was graduated a year later, first in his class of seven.

In 1919 he enrolled at the University of Texas, where he majored in political science, took a minor in economics, and was a member of the Ross debating society. For a time he was assistant issue editor of the student paper. After receiving his Bachelor's degree in 1923, he continued his study of political economy at the university, and in 1924 he was awarded his M.A. Most of the money for college he had earned himself, and, while a senior and a graduate student, he had been a part-time instructor at the university.

The summer after he received his Master's degree Evans spent in Europe studying the governments of England, France, and Switzerland, and the activities of the League of Nations. Upon his return from the Continent he accepted an instructorship at Leland Stanford University, in California. For the next three years he alternately presented problems in citizenship to freshman orientation students and studied for a doctorate, which he took in political science, with modern history as his minor subject (Stanford, Ph.D. 1927). For his dissertation he wrote an examination of the mandates system of the League of Nations.

In 1927 the twenty-five-year-old Evans was appointed to teach government at New York University. The following two years he taught political science at Dartmouth College. Then, from 1930 to 1935 he was assistant professor of politics at Princeton University. (At all three institutions he is said to have been a popular instructor.) During these years he was also writing articles on colonial administration and international relations for political science periodicals. He was, in addition, working on his book *The Virgin Islands From Naval Base to New Deal* (published in March 1945), which has been described as "a comprehensive study of the American administration of the Virgin Islands," and which the *Library Journal* points to as an example of "his painstaking concern about thoroughness in any search for facts." In the summer of 1935 Evans accepted the invitation extended by the Works Progress Administration to become director of its Historical Records Survey, a project calling for a nationwide inventory of historical source materials, including state and local archives and manuscript collections. Under his leadership several hundred guides to historical source materials were compiled and published. The results of the survey were acclaimed alike by historians, archivists, and librarians: the program was characterized as "the greatest single achievement of any nation in describing and interpreting the records of its people."

Harris & Ewing

LUTHER H. EVANS

For Evans personally, the success of the WPA venture meant an offer from the newly appointed Librarian of Congress, Archibald MacLeish '40, to become director of the Legislative Reference Service of the Library of Congress. This position Evans accepted as of December 1, 1939, and held until he was promoted to the post of Chief Assistant Librarian, the principal executive office in the administrative setup of the Library. This appointment became effective November 1, 1940. Twice before his appointment as tenth Librarian of Congress in June 1945, Evans, as second in command in his capacity of Chief Assistant Librarian, had served as Acting Librarian: in 1942-43, when Archibald MacLeish took a leave of absence to direct the Office of Facts and Figures, and after MacLeish's resignation in December 1944.

Luther Evans' appointment as Librarian of Congress was confirmed on June 29, 1945. While this promotion meant little, if any, change for Evans, it has been observed that it marks the first time since the Civil War that the position has been filled from the ranks of

EVANS, LUTHER H.—*Continued*

the staff, and that, had members of the staff "been given the chance to select the next head by ballot, Evans would undoubtedly have been the person selected." *Library Journal* quoted this opinion: "Gifted with imagination and with a practical talent for getting things done, possessing through his background and wide professional experience an understanding of the problems of the people and institutions that the Library of Congress is called upon to serve, Luther Evans has the right qualifications for his new assignment."

During his previous five and a half years' association with the Library, Evans had participated actively in the reorganization made possible by an increased allotment of funds and the acquisition of an annex for its expanding services. "And," states the *Library Journal*, "one has but to read recent annual reports of the Librarian of Congress to realize how far advanced are technical skills [and] solution of library administrative problems." However, busy as his official responsibilities in guiding so large an institution keep him, and despite the scholarly and academic life he leads both in and away from the Library, Evans is always responsive to personal contacts. "Although he has been [since 1940] one of the busiest officials in the Library," wrote a Washington observer, "there is not one member of its staff who will not tell you that he has always been able to arrange an appointment, even on short notice, if requested. Be the staff member's problem official or personal, he has always been ready to discuss it fully."

As chief Librarian, Evans will make few changes in the Library's organization, because, he pointed out, he has been an active molder of its policies in the past. He will conduct the Library as a reference center, because he feels that it is a place from which to obtain information, not a reading room. He hopes, too, to be able to make its collections more easily available to other libraries through increased interlibrary loans, because he believes in the widest possible distribution of the library facilities which may furnish the country's political and military leaders with information capable of vitally affecting the destinies of the Nation. "The Library of Congress," he has said, "is a great factory on the frontier of knowledge. It is complete up to date." Above all, it is Evans' hope to make the Library of Congress to an even greater extent than it is today the active and acknowledged leader of the American library field. During the war the Library made every effort to have available any information which might be needed by any governmental department. "For instance," Evans told an interviewer while the war was being fought in Europe and the Pacific, "we receive by plane Russian and Japanese newspapers, probably brought into China by the underground. Important items are translated and furnished immediately to the State Department and other interested officials. . . .Maybe the War Department wants to know where in Osaka are the aircraft factories. We'll furnish the information. We even made a study of the manpower resources of Japan, the water resources of Morocco, rainfall in Burma, and manpower in Germany."

On behalf of the Library of Congress Evans, in September 1945, accepted the gift of Columbia Broadcasting System's complete files of foreign short-wave broadcasts from August 1939 to the end of the war picked up and recorded by CBS short-wave listening stations all over the world, in more than a dozen languages. When photographed on microfilm the ninety-six thousand pages of CBS records, which had filled forty filing cases, made only about eight thousand feet of film, or approximately the length of a single long feature picture. Copies of the microfilm are available to libraries throughout the United States through the regular interlibrary loan service, a service which Evans has always been interested in extending.

Evans is a member of the American Library Association, the American Political Science Association, the Society of American Archivists (of which he was vice-president for one year), and he has served as director of the reference libraries section of the Association of College and Reference Libraries, and on the Committee on War Devastated Libraries (for a time as acting chairman). In the fall of 1945 he was made one of the advisers to the American delegation to the London conference, which will frame a constitution for the United Nations Educational and Cultural Organization.

The Librarian of Congress has been described as "a brisk, businesslike executive" and as a man who "might be taken for a small-town merchant." An editorial in the Washington *Star* characterizes him as "a self-made success," a man who "came up the hard way, earning every advancement in terms of labors of mind and body." His dominant trait, says the *Library Journal*, is "an open frankness, tempered with a human idealism." The Librarian is five feet ten inches tall, weighs two hundred pounds, has blue-gray eyes and black hair. When reading and gardening do not claim his free time he may be found in a motion picture theater or canoeing. Mrs. Evans is the former Helen Murphy of Gainesville, Texas, to whom he was married September 12, 1925. Their son is Gill Cofer Evans.

FAY, FRANK Nov. 17, 1897- Actor

Address: b. c/o Brock Pemberton, 244 W. 44th St., New York City; h. Savoy-Plaza Hotel, New York City

Frank Fay's style as a comedian in the musical variety field has given him a unique place in the theater. His talent for ad-libing not only has won him the title of America's foremost Master of Ceremonies, but he is given credit for originating that modern adaptation of the old minstrel-show interlocutor. Seemingly without any preparation for a dramatic role Fay in 1944 began his perfect interpretation of Elwood P. Dowd, the genial tipler, who consorts with an invisible rabbit (height is exactly six feet one and a half inches) in Brock Pemberton's '45 production of the Pulitzer prize-winning play *Harvey.* Fay was not only acclaimed by the critics but at the end of the 1944-45 season was given their prize for the best dramatic performance of the year. The Donaldson award, the result of a poll of 2,000 theater workers, went to Fay also.

Born on November 17, 1897, in San Francisco, Francis Anthony Fay (as he was christened) is the son of two stock-company troupers of Celtic origin, Will and Molly (Tynan) Fay. Fay recalls being introduced to the footlights at the age of four, when he was carried onstage by his father in the Chicago company of *Quo Vadis* (1901). Two years later the six-year-old child actor played the Teddy bear in Victor Herbert's *Babes in Toyland,* an engagement that was terminated after six performances when little Francis scattered make-up over the scenery in a temperamental outburst. However, Sir Henry Irving, who was on his last American tour, promptly engaged the youthful Thespian for a bit in *The Merchant of Venice* (1903). An appearance in *The Catch of the Season* and a road tour with Wilton Lackaye in *The Pit* followed in 1905. Somewhere in between these engagements in dramatic plays the boy trod the boards in his first vaudeville act, as the Kid in *O'Leary's Kid.* Then, at the age of eight he made his debut on Broadway as Stephen in *The Redemption of David Corson* (1906). The play closed after sixteen performances, but the following September young Master Fay, "doubling in brass" as the Shrimp and the Call Boy in the cast of *The Chorus Lady,* was able to glory in his first long run (315 performances).

By the time he reached fifteen, reports *Life* Magazine, Fay had traveled with all kinds of stock companies and played in every Shakespearean drama except *Titus Andronicus,* and in such plays as *A Kiss in Central Park* and *An Enemy of the People.* Between engagements he attended the public schools in New York City, where his father (whom he describes as an Indian fighter, actor, railroad man, and poet by turns) made a home for the family. "After briefly grappling with the intricacies of fractions in the fifth grade," continues *Life,* Fay abandoned his formal education. While the elder Fay was not enthusiastic about the theater as a profession for his son, Frank would consider no other.

Although Fay had been eager to emulate Sir Henry Irving as a Shakespearean actor, he subsequently turned his attention to vaudeville. In 1914, among other acts, he appeared in *Frank Fay and His Four Sweethearts.* It was during this period that he began to frequent The Lambs clubhouse in New York; listening to the conversation of Wilton Lackaye, Wilson Mizner, and other famous wits of the time, he absorbed "their cruel but pertinent observations on human foolishness." Though he was soon to realize that the subtle, cynical humor of these men, particularly that used in their own annual show, *The Lambs Gambol,* might be developed into a form more diverting than the then-prevalent slapstick comedy, young Fay joined a partner named Johnny Dyer in an act that followed the timeworn pattern of clown make-up, comedy falls, and gags in illiterate verbiage.

FRANK FAY

Then in 1917 Fay used a new type of comedy technique in monologue. Meticulously dressed in top hat and tails and discarding all the traditional "business," the comedian used an intimate type of patter which critics described as sophisticated. Depending on his natural gifts for satire and wit, in time Fay gained a reputation for never giving the same performance twice. There is, however, a Fay repertoire: the description of his uncle, the string-saver; his Aunt Agatha, the putter-awayer (especially of paper bags); an inebriated gentleman doing a song and dance turn; and his satire of John Charles Thomas '43 singing the "Dark Town Strutter's Ball." In recent years Fay's own particular method of literal analysis of songs has become a great favorite. "He is the one man," said a critic, "music publishers should pay royalties not to sing their songs, because when Fay gets through he has sung a song right off the Hit Parade."

In 1918 Fay temporarily left vaudeville and brought his talents to the Broadway musicals *Girl o' Mine* (1918) of which critics pronounced Fay and his partner, Marie Nordstrom, the "undeniable hits"; *The Passing Show of 1918,* in which Fred '45 and Adele Astaire, Charles Ruggles, and Nita Naldi were starred; *O What a Girl* (1919); and *Jim Jam Jems* (1920). In 1922 the actor wrote, produced, and acted in his own musical show, *Frank Fay's Fables.* The show, one of Fay's first jobs as an "emcee," folded quickly; critic Charles Darnton's verdict, "Not so good, not so bad," was generally accepted by the public and press. That same year saw Fay featured

FAY, FRANK—*Continued*

in *Pinwheel*, and in 1923 he had a successful run in the revue, *Artists and Models.*

For the next four years Fay was booked solidly in vaudeville, winning his first really notable success as a master of ceremonies. His first engagement at the Palace (New York City), the top theater of the vaudeville world, was held over for a second week, and later he was to break all records by playing at the Palace twenty-six weeks out of fifty-two. His rate rose to over the three-thousand mark as a single performer, and as high as seventeen thousand dollars when he carried a company. Fay "set a model to which all subsequent emcees are indebted," observes Maurice Zolotow in *Life* Magazine. "Besides introducing the acts, Fay would interrupt them to work in a gag, walk out onto the stage in each number, fill the time between acts with patter, and otherwise dominate the whole proceedings." "His cockiness and conceit," in those days, Zolotow wrote, "his rollicking sprees, his easy way with cash, and his weakness for pretty girls all made him a prominent figure in the Era of Wonderful Nonsense."

In August 1928, while playing a year's engagement as an emcee at the Missouri Theatre in Saint Louis, Fay was married to Ruby Stevens, who later changed her name to Barbara Stanwyck, whom he had met when she was a chorus girl in one of Texas Guinan's night spots. (Fay had previously been married to Frances White, well known singer of the period, and to the actress Lee Buchanan. Both marriages ended in divorce, and later they were annulled so that Fay and Miss Stanwyck might be married in the Catholic Church several years after their first marriage before a justice of the peace.) The following year Fay signed a contract with Warner Brothers ['45] and the couple moved to Hollywood.

The New Yorker's first screen appearance was as master of ceremonies in *Show of Shows* (1929). Then he played the leads in *Under a Texas Moon* (1930) and *The Matrimonial Bed* (1930), his two most successful pictures. In the meantime Ruby, now Miss Stanwyck, was cast in *Locked Door* (1929) and *Mexicali Rose* (1929). When these pictures failed to click, Fay, on the strength of his prestige in the film colony, persuaded the president of Columbia Pictures and the director Frank Capra to put Miss Stanwyck into *Ladies of Leisure* (1930). Miss Stanwyck promptly began to climb to the top of the cinema ladder, while Fay began to descend the rungs. Fay subsequently appeared in the less successful *A Fool's Advice* (1932), the stage revue called *Tattle Tales* (1933), which he wrote with Nick Copeland, and the two motion pictures *Bright Lights* (1935) and *Stars Over Broadway* (1935).

This reversal of the Fays' professional standing, it is said, was one of the reasons for the couple's divorce in 1935. For many years their marriage had been considered one of the happiest of the film colony; Miss Stanwyck once told a reporter: "I was nobody until Frank came along. He taught me everything I know and I would have been nothing a great deal longer if he had not come along." Following their separation, the Fays engaged in several legal battles over the division of their property and the custody of an adopted son, Dion; eventually Miss Stanwyck received the custody of the boy and was later married to Robert Taylor.

Fay remained in Hollywood, living on his huge Brentwood estate with his father. He secured a role in support of Carole Lombard and Fredric March ['43] in Selznick's ['41] *Nothing Sacred* (1937), and now and then he appeared in night clubs or on the radio. In 1939 he returned to Broadway in a lavishly staged vaudeville revival in which Elsie Janis and Eva LeGallienne ['42] were also starred. In Hollywood again in 1940, Fay played a gambler in Paramount's *I Want a Divorce*, and the priest in RKO's picturization of the play *They Knew What They Wanted*, in which Charles Laughton and Carole Lombard were starred. *Laugh Time* (1943), a revival of vaudeville in the best tradition, returned Fay to Broadway as a master of ceremonies. "Frank Fay," wrote Burton Rascoe in the New York *World-Telegram*, "was in his best form and that is very excellent monologue form, indeed. He is a pleasing personality, a genuine wit, has perfect sense of timing, and good mimetic gifts. His speciality is the humor of anticlimax, which is a form of comedy that requires high technical precision to be effective. And he is expert at it." As Fay later told an interviewer, "The timing and technique in a thirty-minute act is the same as that used in a two-hour play."

Fay's engagement at New York's Copacabana night club in August 1944 caused one critic to point out that "when we laugh at Fay's disjointed and hilarious comment on life we are likely to overlook how well he puts across a song." Another reviewer described him as "a wild-eyed, wild-haired genius of song and patter." It was during this engagement that Brock Pemberton astutely cast Fay in the fantasy *Harvey*. So realistic is Fay's acting opposite the rabbit Harvey, said a typical review, "that grown-up people find themselves accepting as fact the definition that Harvey is a Celtic fairy spirit. . . .The role [of the philosophical alcoholic] demands subtlety of timing, an airy lightness of speech and gesture, and a general air of Gaelic magic." Even Wilella Waldorf of the New York *Post*, who differed sharply with her fellow critics on the merits of Mary Chase's ['45] play, pointed out later that Fay was not included in her adverse opinion. *Variety* in April 1945 announced that Fay had signed a new contract with Pemberton which guaranteed him stardom in *Harvey* for two more years at a minimum salary of $1,250 a week or 12 per cent of the gross box office receipts, which during 1945 netted Fay over $2,000 a week.

Other contributions of Fay's to entertainment in 1945 included a twelve-week engagement on the *Trans-Atlantic Quiz* radio program and the writing of *How To Be Poor*, a book of his personal philosophy put in the form of monologues and illustrated by James Montgomery Flagg ['40]. This volume, published late in 1945, had been delivered to the publishers with "a solemn affidavit that the book was the product of Mr. Fay's own writer's cramp." "One man's humor is another man's poison," commented one critic, and in this fashion the reviewers were divided on the humor or lack of it in the book, the manner of Frank Fay's presentation being the leisurely style of his curtain speeches. "They [the monologues] are light and rambling in their humor, with here and there a sharp thorn of truth lurking among the buds of laughter," declared the New York *Herald Tribune.* Most of the other critics felt, however, that the humor suffered from not having the actor's particular stage delivery to project it, while Harry Hansen '42 observed that Fay's attempts to "get funny with the idea that money is corrosive, a bother, and a handicap," were pretentious and boring.

In October 1945 the governing council of Actors Equity Association censured Fay for statements, which, it was claimed, were "prejudicial to the welfare of the Association and its members." The censure followed Fay's public rebuke of five members for their alleged presence at a Spanish Refugee Appeal rally to which a speech was broadcast from London by Harold J. Laski '41 criticizing the role of the Catholic Church in Spain. The members, in preferring charges, had stated that they knew nothing of the speech, had not been present when it was made. After Equity's censure, Fay, who declared that he had made no charges but had asked for an investigation, prepared to ask the general membership to have the resolution recalled. In a subsequent closed meeting of Actors Equity the membership voted 470 to 72 to uphold their council's censure of Fay.

Described as easy-going and friendly, Fay is three and a half inches shorter than Harvey, and his one hundred and seventy-five pounds are "solid muscle"; his hair is red, his eyes light blue. His constant exercise has paid off in golf championship cups; he is also an excellent tennis player and an amateur boxer. Fay is of a religious nature, a devout Catholic. About six years ago he substituted coffee and more regular hours for his earlier love of stronger beverages and night clubbing. Known as a wit's wit, he has produced many often-quoted spontaneous comments. Once when Milton Berle, the radio comedian, challenged him to a duel of wits, he replied that it was against his principles to fight an unarmed man. The Fay delivery of his celebrated bons mots is "half the show—the gentle smile, the quizzical lift of the eyebrows, the sweet voice, his head cocked impudently."

Who's Who in the Theatre (1939)

FERMI, ENRICO (fār'mē ān-rē'kō) Sept. 29, 1901- Physicist

Address: b. c/o University of Chicago, Chicago

When Britain's former Prime Minister Winston Churchill '42 spoke in the House of Commons after the announcement of the Allies' atomic bombing of Hiroshima in August 1945, he thanked the Axis powers for exiling, among others, Italy's most famous physicist Nobel Prize winner Enrico Fermi: it was Fermi's work from 1934 to 1938 that paved the way for the atomic bomb, which he also helped to design.

ENRICO FERMI

Enrico Fermi was born in Rome, on September 29, 1901, the son of Alberto and Ida (de Gattis) Fermi. That he is today one of the few physicists "thoroughly at home in both theoretical and experimental research" has been attributed by George B. Pegram (physicist and dean of the Graduate Faculties of Columbia University) to Fermi's boyhood interest in both physics and mathematics. The literature of experimental physics attracted Fermi as a schoolboy in Rome. Mathematics first claimed his attention when he was only thirteen, and, for the next four years, his mathematical reading was directed by an engineer friend. As a result, he had, before the age of seventeen, read and digested more of the subject than was required for a Doctor's degree in theoretical physics. It was with this equipment that Fermi entered the Scuola Normale Superiore of the University of Pisa on a scholarship in 1918. Graduating from Pisa in 1922, Fermi then went to the University of Göttingen, where for seven months he pursued his studies, principally with the famous mathematician Max Born, in an atmosphere thick with discussion of the quantum theory. (A fellow student at this time was Werner Heisenberg, who within a few years was to pioneer in the field of new quantum mechanics.) The following year Fermi studied at the University of Rome, and in 1923 he spent some time at the University of Leyden, where, says Pegram, he "matured and developed self-confidence."

In 1924 Fermi was appointed lecturer at the University of Florence, and it was there during the next two years that he made his first important contribution to theoretical physics, today known as the Fermi-Dirac statistics, although Fermi and Dirac arrived at their conclusions independently of one another. Extending "to the motions of the molecules of a gas the already known fact that in an atom no two electrons can exist in the same quantum state," and applying this principle also to an atomic model, the young theoretical physicist formulated the statistical theory underlying present-day work with the electron gas in metals.

In 1926 Fermi began his association with the University of Rome as professor of theoretical physics. There, in addition to making several

FERMI, ENRICO—*Continued*

important contributions to physical research while a member of the university's faculty, he was instrumental in promoting the growth and scientific stature of the university's school of theoretical physics. Until 1934 Fermi was still to be primarily the theoretical physicist, experimenting, of course, but more concerned with general physical laws. Notable in this connection is his perfection in 1934 of a theory of beta ray emission in radioactivity. Accepting the viewpoint that the beta particle (or electron emitted from the nucleus in radioactivity) is emitted as a result of the disintegration of a neutron (electrically neutral or uncharged particle) into its component parts of proton (positively charged particle) and electron (negatively charged particle), he postulated that along with the beta particle there must also be emitted a neutrino (neutral particle of mass comparable in minuteness to the mass of the electron), to account for the "distribution of energies in a continuous spectrum." This hypothesis has since formed the groundwork for further investigations.

The year 1934 was extremely important in Fermi's life not only because it was scientifically his most fertile year, but also because it foreshadowed his greater preoccupation with experimental physics in the succeeding decade. Moreover, the work Fermi began in 1934 led eventually to the invention of the atomic bomb. A few months earlier, toward the end of 1933, Jean Frederic Joliot and his wife Irene Curie '40, the daughter of Marie Curie, had succeeded in creating artificial radioactivity in elements normally exhibiting no radioactive qualities. This opened up a fruitful avenue of research which Fermi was not slow to travel. But, whereas the Joliot-Curies had used as their bullets the generally utilized alpha particles, Fermi determined to try bombarding the atom with the neutron, which had been discovered by Sir James Chadwick '45 two years before. Since the neutron, unlike the positively charged alpha particle, is electrically neutral, it would not, Fermi reasoned, be repulsed by the electric field of the atom and would therefore stand a much better chance of reaching its target and accomplishing its purpose of splitting the atom.

Experiments with the neutron at once proved Fermi correct, and within a short time he and his colleagues in the physical laboratory of the University of Rome had succeeded in inducing artificial radioactivity in approximately forty of the more than sixty elements which they bombarded with neutrons. Particularly important to future developments was Fermi's discovery during these experiments of the highly increased effectiveness of the slowed-down neutron. The neutrons which Fermi originally obtained by shooting alpha particles at beryllium powder he found were apt to speed past the nucleus without much effect. But when he happened to let these neutrons pass through paraffin on their way to the target he found them entering the nucleus in the same way that a slow golf ball will fall into the cup while a fast one rolls by. This effect Fermi attributed to the hydrogen nuclei in the paraffin which, he theorized, were able to hinder the neutron in its path because their mass is equivalent to the mass of the neutrons; and in 1935 Fermi wrote the equation of the probability of success in the use of slow neutrons. Recent newspaper accounts of the atomic bomb have made much of the slow neutron which is able to split U-235.

Fermi's experiments with artificial radioactivity during the period between 1934 and 1938 also presented a scientific problem which has not yet been satisfactorily explained. In 1934 Fermi announced the artificial creation of a new element—ekarhenium of atomic No. 93—exhibiting radioactivity for thirteen minutes before disintegrating, which accounted for its nonexistence upon earth. Shortly thereafter he announced the creation of its transuranic—or heavier than uranium—twin, No. 94, and later confirmation of his results came from Germany and the United States. Many scientists, however, doubted these phenomena at the time, and Fermi himself said early in 1939 that his chemical analyses of the results did not enable him to state definitely whether he had proof that the new elements were heavier than uranium or whether some unusually complicated disintegration was taking place unrecognized. When uranium fission was announced in January 1939 many scientists leaped to the conclusion that Fermi's results had been identified as transuranic elements only because Fermi, not expecting fission, had not checked back far enough in the table of chemical elements to realize that his end products were in reality elements of half or less than half the weight of uranium. The manufacture of transuranic neptunium and plutonium—now respectively elements No. 93 and No. 94—for the atomic bomb, however, suggests that Fermi's original explanation may have been correct, even though he has said that possibly only the thin aluminum foil which prevented his completion of an experiment kept him from discovering uranium fission. (Indicative of the differing viewpoints is the official War Department report in which H. D. Smyth supports first the transuranic element interpretation of Fermi's results and later the uranium fission interpretation.)

In any case, it was in repeating Fermi's experiments that Otto Hahn and Fritz Strassmann performed the operation which was recognized by Lise Meitner '45 as uranium fission. Lise Meitner and Otto K. Frisch informed Niels Bohr '45 of their tentative conclusion in January 1939, just before Bohr left Denmark for America. (This is the story according to the War Department report; earlier accounts vary in details.) Fermi, who had received the Nobel Prize from, and lectured to, the Swedish Academy of Sciences in December 1938, had already arrived in the United States to take up his career, free from Fascist interference, as professor of physics at Columbia University. Bohr, who came to work for the next several months at the Institute for Advanced Study at Princeton, immediately told his Princeton colleagues, from whom the news went to Fermi. While Fermi left to attend the Conference of Theoretical Physics in Washington, John R. Dunning and George B. Pegram, working in a laboratory under the physics building of Columbia University, made the experiment which proved that the uranium atom had been split. Attending the meeting at George Washington University, Bohr and Fermi thus discussed, before the Columbia experiment had been completed, "the problem of fission, and in particular

Fermi mentioned the possibility that neutrons might be emitted during the process," making possible chain explosions. In March 1939 it was Fermi who was sent by Columbia University to interest Government officials in the possibility of an atomic bomb, and at that conference with the Navy Department "Fermi [first] suggested the possibility of achieving a controllable reaction using slow neutrons or a reaction of an explosive character using fast neutrons."

When the Government decided to attempt the production of an atomic bomb in early 1941, Fermi, who had been engaged in uranium research at Columbia, was one of the scientists summoned for the project: he was appointed chairman of the Theoretical Aspects Subsection of the Uranium Committee in the summer of 1941. Then, continues the Smyth report, in January 1942 physicist Arthur Holly Compton '40, in charge of chain reaction and plutonium research, "decided to concentrate the work for which he was responsible at the University of Chicago. The Columbia group under Fermi and its accumulated material and equipment . . . [was] moved to Chicago in the course of the spring." Under the protective name of "The Metallurgical Laboratory," researches in the manufacture of plutonium were begun and carried out. It was there on a squash court under the University of Chicago's stadium that the first plutonium "pile" was set up, with graphite used as a moderator or retarding agent to induce the chain reaction, as proposed by Fermi. The "pile" was "an oblate spheroid (doorknob shape), built up of graphite bricks with lumps of uranium . . . imbedded in their corners"—and at one point the material nearly got out of hand because the scientists had overestimated the "critical size" at which the chain reaction would begin spontaneously. After the first chain reaction had been obtained on December 2, 1942, and construction on plutonium plants had been started, Fermi was transferred to Los Alamos, New Mexico, as chief of the advanced physics department of the newly organized bomb production laboratory headed by J. Robert Oppenheimer.

In the summer of 1945 Fermi, who had won a Nobel prize in 1938, the Hughes Medal of the Royal Society in 1943, and who is the holder of several honorary degrees, was one of the first scientists to be appointed to a professorship in Chicago University's new Institute of Nuclear Studies, an atomic research foundation established as an outgrowth of the university's participation in the atomic bomb project. Fermi, together with Arthur H. Compton '40, J. Robert Oppenheimer '45, and Ernest O. Lawrence '40, was also made a member of the scientific panel set up to advise the interim committee on atomic energy control. A member of the Association of Los Alamos Scientists, Fermi believes with his fellow atom bomb workers that scientific information should be freely accessible to all, that military control of science is undemocratic.

Sir Henry Dale, president of England's Royal Society, has said of the physicist: "Professor Fermi's work is characterized throughout by profound insight and great experimental skill. In the fields which he has made his own he is universally acclaimed a leader." And George B. Pegram, chairman of the physics department while Fermi was at Columbia, has written: "Very direct and clear in his thought and speech, sincere but not too serious, using few unnecessary words, he is recognized as an outstanding teacher. In experimental work also he achieves the direct and simple approach and in his discoveries he exemplifies well the fact that only the clearest minds can for the first time do the things that immediately thereafter are so simple and obvious for any one." It was in response to a long-standing invitation to live in America that Fermi, who had taught for a number of years at Michigan, Stanford, and Columbia University summer sessions, came to Pegram's physics department in 1939. (By 1945 he had become an American citizen.) He brought with him to America his wife, Laura (Capon) Fermi (to whom he was married in Italy in 1928), and their children, Nella and Giuglio. With a collaborator Mrs. Fermi has written a popular exposition of her husband's work.

FERRISS, HUGH July 12, 1889- Architect; artist

Address: b. 101 Park Ave., New York City; h. 35 E. Ninth St., New York City

To those who fear that functional architecture will always remain ugly, the president of the Architectural League of New York offers hope that the city of the future will combine beauty with utility. Hugh Ferriss, recipient of frequent prizes from the League before (and after) he was elected its president, consultant to achitectural planning commissions, and America's "No. 1 artist of architecture," whose drawings constantly appear in professional and general periodicals, believes that we are on the threshold of a new epoch in architecture.

Hugh Ferriss was born in St. Louis, Missouri, on July 12, 1889, the son of Franklin and Elizabeth Hall (Simon) Ferriss. He received his early education at the Manual Training School in St. Louis, and in 1911 he was graduated from the School of Architecture and Engineering of Washington University (St. Louis) with the degree of B.S. in architecture. From 1912 to 1915 he served his apprenticeship in the office of Cass Gilbert, New York architect, designer of the Woolworth Building in New York City and of the United States Supreme Court Building in Washington, D.C. Having been engaged as a draftsman by Gilbert, Ferriss spent these three years drawing from Gilbert's blueprints visualizations of the buildings and sections of

HUGH FERRISS

the buildings as they would appear when completed. In this way he had a small part in the construction of the Woolworth Building.

Then in 1915 Ferriss left Gilbert's office to establish a private practice. For the next fifteen years his time was unequally divided between much free-lance sketching of previews of structures about to be erected and an occasional essay at the preparation of original architectural designs. In the early twenties, for instance, when the new zoning laws (requiring that upper stories of tall buildings be placed back from the foundation line) were troubling other architects with supposed restrictions on initiative, Hugh Ferriss originated a fundamental skyscraper plan embodying the regulation's principles. This became the model for New York's Shelton Hotel, one of the first notable stepped-back skyscrapers, and for much of the city's skyline. Interspersed among these pursuits in Ferriss' program before 1930 were several series of lectures which he gave on architectural illustration and design at Columbia University in 1926 and at Yale University and the University of Pennsylvania in 1928. Also in 1928, his alma mater, Washington University, conferred upon him an honorary Master of Arts degree.

Ferriss was at that time, and still is, primarily an artist of architecture rather than a professional architect in the accepted sense of the term. Although his original designs and "grandiose" conceptions of the possibilities inherent in modern architecture are said to have profoundly influenced the profession in America, he has chosen to spend the larger part of his time in interpreting in mass and line the unrealized outlines of other architects' visions and in recording the best of the contemporary architectural scene. Technically designated "architectural rendering," Ferriss' craft is virtually unknown as such outside the precincts of the architect's office, or, if known, is considered merely "arty." Yet it is one of the most useful and important aids the architect can utilize. In an article for the *Encyclopædia Britaannica,* and elsewhere, Ferriss has defined it thus: "Architectural rendering is a pictorial art whose object is to visualize architectural conceptions." Architectural rendering is employed "to render clear—to make plain, record, report—some particular set of facts about some particular building project. Its aim is to communicate those facts which cannot readily be communicated in words."

The commonest use of architectural rendering is therefore to "convey advance realizations of proposed structures," particularly to the architect's clients. Equally important is its function in aiding to clarify ideas in the architect's own mind. "When an architectural conception first forms in the background of [the architect's] mind," Ferriss explains, "it has, of necessity, a certain nebulous character. But with the effort of expressing it on paper, in actual lines and tone values, it emerges, so to speak, and crystallizes. When so employed, rendering serves as a definite step in the evolution of architectural conceptions." Other uses for the graphic representations of architectural renderers include the interpretation of the architectural significance of existing buildings—the art which Ferriss himself has so successfully developed—guidance in city planning, assistance "in evolving new types of architecture" and the strengthening, through the medium of selected drawings, of the "psychological influence of architecture on human values."

The technique of the skill varies, but Ferriss believes that the draftsman's "best procedure is first to delineate the essentials of his subject, then to build all indication of detail on his foundation." Ferriss sees the draftsman approaching his subject as though he were "facing a building which, although it exists in its entirety, is completely hidden from him in a mist or fog. As he approaches his subject, however, he begins to discern the principal outlines of its mass. Soon its secondary and tertiary features appear. He is free to continue to approach until the most minute details have become plain. Nevertheless, it is important that he halt at that point where his subject has revealed all that is essential to his inquiry." For above all, Ferriss maintains, the artist must always remember that the rendering is only the means toward the end, which is architecture.

In the preparation of his only book, *The Metropolis of Tomorrow* (1930), Ferriss employed the architectural rendering to illustrate his vision of the possibilities inherent in the still dim future of modern architecture. The volume pictures a planned city of wide open spaces with a few necessary huge buildings placed at infrequent and strategic intervals (another extension of the principles of the zoning laws). Each mammoth structure is the center of a particular functional district of the city: one houses the business center; another the science center; a third the art center; and so on. Each covers an area equal to three or four present-day city blocks and stands at least one-half mile distant from each of the others. Between them run avenues two hundred or more feet wide, and the roofs of all other buildings, which are low, provide areas for gardens. The style of these renderings, as comparison with others of his drawings readily establishes, is typical of the work of Ferriss, who, according to the *Saturday Review of Literature,* "is probably excelled by no draftsman practising today in indication, a sense of three dimensions, and monumental imagination." "He deals," the *Saturday Review* goes on to say, "with composition in mass and line, free from the preconceived dogmas of esthetics. He shows us the mountain, not each tree, stone, or waterfall on its slopes. Thus his designs are inspiring and awesome, perhaps too grand for immediate realization, but surely pointing the direction for our striving." And Albert Guerard of *Books* described the volume as "wise and generous in vision, cogent in thought, clear and strong in literary style, appealing as a work of art, magically stirring as a prophecy."

Ferriss' career since the publication of his book has brought him varied tasks and commissions and many rewards and prizes. He received his first prize—for rendering—from the Architectural League of New York in 1930. In 1934, for his rendering of the new Philadelphia Post Office, he was awarded the Birch Burdette Long Memorial Prize, given annually for architectural drawing by the same organization. Between 1936 and 1939 Ferriss served as one of the architectural consultants to the planning commission responsible for the New York World's Fair and drew many of the Fair's buildings as the plans were being worked out. In 1940 Ferriss and Leon V. Solon, artist, won the first Arnold W. Brunner award established to promote and encourage "accomplishment in the arts and professions represented in the membership of the Architectural League of New York, and to render such arts and professions of greater use to the community." Dividing the $2,000 in prize money between the two winners in such a way that both would be able to bring their projects to fruition, the League commissioned Ferriss to make a series of forty drawings of buildings erected in the United States since 1929 which, in his opinion, were "expressive of this Nation during this period, and worthy as combinations of usefulness and beauty to be recorded as masterpieces of contemporary architecture." Consequently, the year 1941 found Ferriss traveling a distance of 18,000 miles through forty states to record, within a period of six months, such architectural and engineering projects as a Curtiss-Wright plant, the Ohio Steel Foundry, the San Francisco-Oakland Bridge, the National Airport at Washington, D.C., and Boulder, Morris, Grand Coulee, and Shasta dams. The work was not easy, even after the selections had been made: "A peculiarity of Grand Coulee," Ferriss reported, "is the difficulty of grasping its magnitude . . . it was difficult to realize that the powerhouse . . . is as tall as the Architects Building in New York—eighteen stories." Upon completion of the drawings, the series was exhibited first at the League's headquarters in New York, and later at the Whitney Museum of Art, under the title "The Power of America in Buildings."

In 1941 Ferriss had also received the Allied Arts Prize (or President's Medal, as it is commonly called) from the Architectural League of New York, "for devotion to the League's welfare and especially for stimulating that interest in the arts for which the League stands by means of the panel exhibitions initiated and carried through this first year by his untiring efforts." He spent the year 1942-43 in making drawings of United States war plants with the official approval of the Secretaries of War, the Navy, and the Interior. Then in 1943 Ferriss was one of the ten recipients of one-thousand-dollar grants, given jointly by the American Academy of Arts and Letters and the National Institute of Arts and Letters, awards designed to aid creative artists in their work. In 1943, too, he was installed as president of the Architectural League of New York, to which post he was re-elected for the year 1944-45. And in 1944 he again won the Birch Burdette Long Memorial Prize.

The study occasioned by the fulfillment of the terms of the Brunner award impressed upon Ferriss certain trends and aspects of modern architecture and caused him to reach new, and reaffirm old, conclusions. Architecture, he had long felt, is history in stone and brick and steel. In that, he was not alone, he points out, for historians and sociologists have always seen the pyramids not merely as a "handsome mass" of stone but as a reminder of the slaves who dragged up the blocks from which they are built, and they have seen a medieval village nestling below the lord's castle not merely as a picturesque scene but as a symbol of feudalism. In 1941 this conclusion that architecture is history, which had occurred to him first ten years earlier, was brought home to him vividly once more. In 1930, standing on a parapet on the Architects Building in New York in the strange silence of empty offices and empty streets, he had become aware of a new meaning in the Manhattan skyline: then "those towering masses seemed monuments to the rugged individualism of the period; their topmost, unnecessary floors and gilded spires, to the conspicuous waste and rampant advertising; their long shadows across slums at their feet, to the exploitation." In 1941, however, he realized that that mushroom growth of skyscrapers had ended about the year 1930, for, with the exception of Rockefeller Center, he found almost no major skyscraper developments of recent date. In their stead America was building dams which give evidence "of a nation in its age of power," highway projects and airports which "record the stage of mobility," publishing plants, auditoriums and churches which "in their multiplicity and diverse character are the concrete signs of our Freedom of the Press, of Speech, of Assembly, and of Worship."

Ferriss wrote in 1942 that he had not been able to travel far in the United States "without realizing that this war, to a surprisingly large extent, is being waged in buildings." "It should be obvious," he was moved to add, "that we could have no aircraft without the aircraft plants; that factories could not operate without power plants, and could not be manned without the projects to house the men. . . . Yet one has to go through the country, seeing things at first hand, to realize the true enormousness of the war-construction effort. . . . To bring home a general, dramatic, and inspiring sense of it would be a national asset." Buildings, he asserts, indicate how we are fighting and what we are fighting to defend.

FERRISS, HUGH—*Continued*

They are records of civilization. "Our way of living is shown, in large measure, by the kind of buildings we build."

This same tour suggested to Ferriss that there was now hope that the reintegration in architecture between the artist and the engineer would come in the not too distant future. Before entering college Ferriss had taken the dictionary definition of architecture—"the science and art of building"—literally, believing that in the architect were blended the best of the artist and the best of the scientist. But at Washington University had come his rude awakening when he had seen the engineering and architectural students in the School of Architecture and Engineering housed on opposite sides of the campus and actually throwing stones through each other's windows. Consideration of the question during succeeding decades showed him that in the twenties the architectural "artists" dominated the scene employing the engineers, so to speak, whereas in the thirties their positions were reversed, with the architectural "engineers" employing the artists, if the artists had anything to do with the matter at all. On his return from the Brunner trip, however, Ferriss was able to say, "I thought perhaps enough time had already elapsed for the first signs of beauty to appear in this new world of precise forms —for the reunion between scientist and artist to begin. I offer these drawings in evidence that a reintegration is well under way." The conflict has been, he says, "between those who find their chief inspiration in art, in forms of beauty," believing that a beautiful building is valid in any age solely because it is beautiful, and "those who find their chief inspiration in science, in truthful statements of actual functions," to whom an adaptation of the Parthenon erected today appears merely as an anachronism.

Early in 1945 Ferriss, addressing the Art Commission Association at its annual dinner, stated his own strong convictions "that architecture has two legs to stand on, science and art. That to be upright, it has to stand on both of them. That when this happened we got the 'grand epochs' of architecture, and only then. That it has not happened in the lifetime of anyone in this room. That in the younger generation, and their designs, are grounds for believing that it will happen within the predictable future. That the exact appearances of this future architecture cannot yet be delineated, except that we may confidently say it will resemble neither that of the twenties nor the thirties. That, meanwhile, we do well to keep an open mind; and do better if we lend a hand."

Hugh Ferriss is a man of medium height, dark complexioned, mustached. Mrs. Ferriss, to whom he was married in May 1914, is the former Dorothy Lapham. They have one daughter, Jean Elizabeth.

FESTING, FRANCIS W(OGAN) Aug. 28, 1902- British Army officer
Address: b. c/o War Office, London

The three years after 1941, which saw such dramatic military history being made in the Pacific and European theaters of operations, meant to the Allied forces in Burma an endless "edging in from east and west at a right angle across the mountainous ridges of Burma." At last, when they had possession of the northern ends of the invasion routes, they were able to drive back an enemy which had held nearly all of that sweltering jungle land. One of the commanders who helped in that victory is British Major General Francis W. Festing, former leader of the Thirty-sixth Division in the Southeast Asia and China-Burma-India commands, who became in late 1945 general officer commanding the base of Hong Kong.

Francis Wogan Festing was born August 28, 1902, in England. Gazetted in December 1921, before the Second World War he had never served in combat. He was a lieutenant of rifles when, in 1926, he was appointed as aide-de-camp to a divisional commander, a post he held for four years. Upon graduation from the Staff College he was promoted to captain, and as an air liaison officer he served in the Eastern Command from 1936 to 1938. Transferred next to the War Office in London, he was promoted to the brevet rank of major, a commission giving an army officer a higher nominal rank but no increase in pay. In February 1939 Festing returned to his regiment as a lieutenant colonel.

When the war in Europe broke out in 1939 Festing, despite his desire to be posted to a combat area, was appointed liaison officer between General Headquarters in France and the War Office in London. In 1940, as the Germans invaded Norway, England dispatched a small expeditionary force to relieve the hard-pressed Norwegians. A company commander of this Allied force sent "to purge and cleanse the soil of Norway from the filthy pollution of Nazi tyranny," in the words of the then First Lord of the Admiralty, Winston Churchill '42, was Colonel Festing. The absence of artillery, antiaircraft batteries, air support, and antitank guns soon forced a hard-fought British withdrawal, and on June 10 Festing, and what was left of the British troops, re-embarked for England.

During the months which followed, when England was on the alert for an expected German invasion of the Isles, Festing was in command of units of the Home Forces, priming them for the defense. In this period he received two advancements, from lieutenant colonel to colonel, and next to brigadier (acting).

In 1942 the accelerated Japanese operations against Ceylon—coupled with Vichy's new rapprochement with Germany that brought Pierre Laval '40 to power—made the French island of Madagascar a possible target for Japanese attack. Since Madagascar formed one of the links in England's eastern supply line, it became necessary for the British to seize this island off the coast of eastern Africa. On May 5, with Festing in command of the assault landings, the occupation began, the British demanding the surrender of the French garrison. The demand was ignored. In the battle that ensued

Festing stationed himself in the most advanced line, engaging in personal reconnaissance and encouraging his men. Accompanied by his chief petty officer, he entered Antsirabe long before the struggle was over and accepted the personal surrender of the French Army's commander. The British were thus able to take possession of their key objective, the naval base at Diégo-Suarez, forestalling a possible Japanese landing on this strategically important east African island. Upon completion of this mission Festing was awarded the Distinguished Service Order. The citation reads: "While in command of the assault brigade he planned all details and carried his task through with great ability and dash, showing almost complete indifference to shelling and sniping."

By 1943 their strength in the Far East had grown sufficiently in men and steel for the Allies to attempt a counterthrust in Burma to open direly needed communications between India and China. The Japanese, intent upon invading India, bombed Chittagong, the Indian city over the Burma border, bombed Ceylon, and attacked ships in the Bay of Bengal. India seemed in imminent peril. To thwart this new Japanese aggression, the British embarked on a more intensive training program and sent Major General Festing to India to instruct and assume command of the Thirty-sixth Division. For nearly five months Festing drilled and trained his men in jungle warfare while General Orde Charles Wingate's Penetration Group (better known as the Chindits or Raiders), pressed farther into enemy-occupied territory. This group, comprised of British, Indians, and Burmese, had acquired under Wingate's leadership an unequaled reputation for jungle fighting.

In the autumn Festing and his Thirty-sixth Division joined the Fourteenth Army under General Sir William Slim '45, and by the early part of 1944 this contingent was pressing forward in the Arakan sector—"a wild, swampy noxious coast [in Western Burma] that experiences some of the heaviest rainfall in the world" —trying to keep the lines of communication open between the Fifth and Seventh Indian divisions that were advancing south. When the Japanese counterattacked, pinching in on the Seventh and on part of the Fifth, the Fourteenth Army held the Japanese at bay until the Twenty-sixth Indian Division and the unattacked portion of the Fifth Indian Division hacked down from the north through the jungle to relieve the oppressed troops.

In early 1944, when the Fifth Indian Division (part of General Philip Christison's '45 Fifteenth Corps) was flown north to Imphal in Assam, Festing's Thirty-sixth Division had to protect the battle area the Fifth had left, and also the incompleted Bawle-Razabil Road some distance away. Festing led his troops over the Mayu Ridge in Burma through Japanese positions, seized strategic points in the Mayu hills, and continued to advance with his division to secure the western tunnel of the Maungdaw-Buthedaung Road. Later the division was transferred to the command of General Joseph W. Stilwell '42, participating in the capture of the important Myitkyina airfields in Northern Burma. Then Festing started fighting his way southwest, along the Mogaung-Mandalay Railway, and achieved a link-up with the Chindits under General Walter D. A. Lentaigne '44, Wingate's successor, in Central Burma. Health conditions in the sweltering, snake-infested Burmese jungle were such that in the Fourteenth Army there were more cases of illness in the first six months of 1944 than the number of its personnel; in the first six months of 1945 there were six cases of illness for each battle casualty.

British Official Photo.

MAJ. GEN. FRANCIS W. FESTING

By the time the Japanese surrendered in August 1945, the Allied forces had liberated 85 per cent of Burma. Shortly thereafter, British marines and navy men raised the white ensign over Hong Kong; and on September 16, 1945, Festing was present at the surrender of the Japanese commander to Admiral Cecil H. J. Harcourt. At this time he was assigned to Hong Kong as general officer commanding. In late November the General told reporters that his troops, which then numbered about eleven thousand, would probably be increased eventually to twenty-four thousand, and added that Hong Kong would supplement but not succeed Singapore as a naval base. In January 1943 the American and British Governments had renounced their extraterritoriality and other special rights in China. The British had, however, decided to retain Hong Kong as a Crown colony. The colony includes the island and city of Hong Kong, and the Kowloon peninsula.

The physique of the tall, broad-shouldered General is said to have once frightened an enemy garrison commander into surrendering. The story may be apocryphal, but there are several such stories told by the British about Festing, who, they say, carries with him on the battlefield an ash stick rumored to be four inches thick. And, indeed, his citation for the D.S.O. ends with this description: "His leadership was always an inspiration and forceful, as on the occasion when he applied his walking stick to the back sides of the few recalcitrants who appeared to have unnecessary interest in the rear areas." The General has

FESTING, FRANCIS W.—*Continued*

once or twice fought Japanese himself in single-handed combat, and, an inveterate souvenir hunter, he has in his collection some Japanese battle relics.

FIEDLER, ARTHUR (fēd'lēr) Dec. 17, 1894- Conductor

Address: b. Symphony Hall, Boston; h. 28 Marshal St., Brookline, Mass.

At the close of the Boston Symphony Orchestra's winter season the black leather seats in Symphony Hall are removed and tables and chairs are set up in readiness for the food and drink "snacks" that will be served to audiences. Then the "Pop Concerts, a special spring product of Boston," entertain a full house almost every night from early May until mid-July, whereupon the Pop Orchestra moves to the Charles River Esplanade for its summertime free open-air concerts. The conductor of this popular—hence "Pop" or "Pops"—orchestra is Arthur Fiedler, who founded the Esplanade Concerts in 1929 and has conducted the Pop Concerts since 1930. A leader in many musical activities in and about Boston, Fiedler is said to have the distinction of being the only conductor whom everyone calls by his first name. Truck drivers who are Esplanade devotees hail him on the street, and servicemen write to him of their enjoyment of records and rebroadcasts of the Pop programs, which include everything "from Bach to Boogie Woogie."

ARTHUR FIEDLER

Of Austrian ancestry and the son of Emanuel and Johanna (Bernfeld) Fiedler, Arthur Fiedler was born in the Back Bay section of Boston on December 17, 1894. "Music was in the Fiedlers' blood," writes the music critic of the Boston *Globe*, and Fiedler believes that the family's name derives from the German word *Fiedel*, meaning fiddle—for generations, he says, the Fiedlers were fiddlers. Arthur's grandfather was an orchestral conductor in Sambor, the Polish town in which Emanuel Fiedler was born. Emanuel was brought to Boston by Wilhelm Gericke in 1885 to play in the first violin section of the Boston Symphony Orchestra, later becoming one of the original members of the famous Kneisel Quartet. Two brothers of Emanuel also were violinists and members of the same orchestra, and Arthur's three sisters are musicians.

Young Arthur attended the Prince School and Latin School, both in Boston, until 1910, when his father decided to return to Vienna with his family. Thus the Fiedlers lived in the Austrian capital for a while, and later went to Berlin. There the boy had a "brief exposure to business" while he worked in a publishing house. Business did not interest him, however, and he enrolled at the Royal Academy of Music of Berlin, where he studied the violin from 1911 to 1915 under Willy Hess who had once been concertmaster of the Boston Symphony. At this time he also studied the piano and conducting, at the age of seventeen being given his first opportunity of leading an orchestra at a concert when he conducted *Three German Dances* by Mozart and Mendelssohn's G-Minor Piano Concerto.

At the age of nineteen the young musician returned to America and became a member "in good standing" of the Boston Symphony Orchestra, playing in the second violin section under the direction of Karl Muck. In the words of the *Bostonian Magazine,* "the dark young man with the magnetic eyes and the thick hair occupied his modest chair until 1918, when he switched to the viola because it was more interesting." That year, when the United States was at war, young Fiedler served for a short time in the Army; upon receiving his honorable discharge he returned to his chair in the Boston orchestra, where he continued to play the viola until he became conductor of the Pop Orchestra in 1930. At times he also played the celesta, the piano, and the organ, and he frequently acted as accompanist for singers and as a musical coach. Not long after his discharge from the Army be organized the Boston Sinfonietta, an orchestra of twenty-five pieces which devotes itself to chamber music. Composed of members of the Boston Symphony, this small orchestra is said to be the first of its kind in America to use the name "sinfonietta." For years Fiedler toured the country with this group and directed it in many concerts in Boston. The music of the Arthur Fiedler Sinfonietta, as it is commonly called, is well known among those who enjoy the Victor albums of recorded music.

For a long time the "son of the Boston Symphony" had looked forward to a time when open-air concerts of symphonic music might be heard by the public without charge. Band concerts were the only form of music given out of doors when Fiedler began to talk to friends about his hopes. He received little encouragement, however, for the friends were politely skeptical and the police thought it would be too difficult to handle crowds. Nevertheless Fiedler persisted, a site was finally chosen on the bank of the Charles River in the heart of picturesque old Boston, and funds were provided to build a small wooden shell and to support the project for one year.

The first concert was given on the Fourth of July in 1929, on a night when a strong wind made the musicians' scores fly about like sea gulls. The concert was an unquestionable success. Later the state of Massachusetts supplied the money for the erection of a second shell, which proved acoustically good but inadequate in other respects. After Fiedler brought the Esplanade concerts to the attention of the trustees of the Hatch Fund, the Edward Hatch Memorial Shell, a permanent sounding board of granite lined with teakwood, was constructed at a cost of two hundred and seventy thousand dollars. "A long-cherished dream come true," the conductor said on the night of its dedication. In an article in the *Atlantic Monthly* entitled "Music Al Fresco," Fiedler has described the sky-and-water setting for the music, which is heard by a quarter of a million people in the course of one summer. While the programs of these concerts are shorter than the Pops offered in Symphony Hall, they are more serious, sometimes including a complete symphony. Their conductor finds particular enjoyment in his morning outdoor concerts for children, who usually attend in groups from playgrounds and settlement houses. For them his orchestra plays lighter music in programs on which youthful soloists often appear.

An audience estimated at forty thousand, the largest in the history of the Esplanade concerts, attended the closing concert on the evening of August 15, 1945. For that occasion a special program was arranged by Fiedler to celebrate the victory over Japan, and Massachusetts' Governor Maurice J. Tobin expressed his gratitude to the conductor and his orchestra for the concerts they had given in veterans' hospitals and for other contributions to the war effort.

At the indoor Pop Concerts in Symphony Hall, which in the spring follow Boston Symphony Orchestra programs directed by Serge Koussevitzky '40, the atmosphere is informal as listeners relax to the bright rhythms and flowing melodies and consume sandwiches and cold drinks between the numbers. These concerts have been compared to the English "Promenades," but the *Victor Record Review* considers them less serious in nature than either the "Proms" or the Stadium Concerts in New York City. Folk songs, overtures, ballet pieces, and marches are played, and among the composers on the programs are Richard Strauss '44, Gounod, Bizet, Offenbach, as well as the moderns, George Gershwin, Jerome Kern '42, Cole Porter '40. The Pops repertory includes several hundred works in a single season and is constantly augmented by popular hits and by new works of American composers, in whom Fiedler is always interested. "It is like mixing a salad," he has said in speaking of the preparation of the Pops programs. He studies his audiences, taking note of selections that please them, and the result may be a program of *Oklahoma!* selections, the introduction to the third act of *Lohengrin,* and the overture to *William Tell,* "a nice balance between the classical and modern." It has been pointed out that the direction of the Pops is a "large order," for the man with the baton must "understand and satisfy the symphonic purist and the jazz hound, each on his own ground."

Aside from his conducting of the Pop and Esplanade concerts, Arthur Fiedler is active in many enterprises, musical and otherwise. He is both orchestral and choral conductor, for he directs the Cecilia Choral Society, the Boston Male Choir, the University Glee Club of Providence, Rhode Island, the MacDowell Club Orchestra, and the Boston University Orchestra. He has appeared as guest conductor of the symphony orchestras of Boston, Minneapolis, Montreal, Toronto, and Guatemala, and with the Federal orchestras in New York and Philadelphia. His appearances on the radio have been numerous, and during the winter of 1945-46 he will resume the direction of the Boston Symphony Pop Orchestra on *Sundays at Four-thirty* on NBC.

The conductor is a member of the Boston University faculty and of the Harvard Musical Association. He is musical consultant to the Veterans Administration, and in 1940 he organized the Massachusetts National Youth Administration Symphony Orchestra, which he conducted until it disbanded in 1942. Active in bringing music to servicemen, Fiedler is on the entertainment committee of the USO-Greater Boston Soldiers and Sailors Committee, and in 1943 he served as chairman of the Victory Concerts held at the Museum of Fine Arts. During the war his defense duties included service as auxiliary policeman in Boston as well as membership in the Temporary Reserve of the United States Coast Guard. Among the honors bestowed upon the Boston conductor are: the Carnation decoration from the *Jewish Advocate* of his city; an honorary M.A. degree from Tufts College, and the Croix de l'Officier d'Academie for his interest in the music of French composers.

"The indefatigable Arthur Fiedler" is looked upon as a many-sided musician, a conductor who is also a master of the viola, the celesta, and the piano keyboard, and gifted with absolute pitch. He is regarded as a "quick-study" at score reading, with the ability to adapt himself to the music of any composer of any century. Although some critics find him, as a conductor, a very able technician rather than an interpreter, his popularity with the public is undisputed, and *Musician* finds his readings "always inspiring." Another critic has written: "He gives of himself freely and has won the admiration of musicians and devotees of music not only in Boston but wherever Pops recordings and broadcasts are heard." The conductor is also known to be a keen businessman who keeps an eye on the box office and publicity in behalf of his orchestra. He and his Esplanade orchestra arrived for one night's concert by boat from the opposite shore of the Charles River in time for a "chance meeting" with newspaper photographers, and at a Gay Nineties Evening of the Pops a barouche pulled up before Symphony Hall and Fiedler descended dressed as a dandy of the period, complete with stick and topper.

Fiedler is described as "a blend of Beacon Street, Europe, and the Stork Club." One of his greatest interests is travel—he has visited most of the conventional tourists spots of the world as well as less-traveled places. (As a young man he roamed the Black Forest of Germany and in one week walked the hundred and seventy-five miles between Paris and

FIEDLER, ARTHUR—*Continued*

Tours, his luggage consisting of a toothbrush.) An interviewer describes him as a handsome, distinguished-looking man of average height with dark eyes and graying hair. His manner is suave and urbane, and he speaks with the same energy and emphasis he puts into his conducting.

One of Boston's eligible bachelors for many years, the conductor was married in 1942 to Ellen M. Bottomley, a Boston society girl. The Fiedlers live in Brookline, the exclusive suburb of Boston, where Louise, the musician's housekeeper for many years, prepares the Austrian and Hungarian dishes he likes. His hobbies are collecting antiques, ship models, old woodwind instruments, and miniature scores. His musical library is known among musicians as a unique collection of editions published in Europe—it includes numerous first editions of Strauss waltzes and many of the one hundred and four Haydn symphonies. The Pops conductor can speak and "read his way around" in Germany, French, Italian, and Spanish. He can swear in Polish.

FISHER, GEOFFREY FRANCIS, ARCHBISHOP OF CANTERBURY May 5, 1887- English primate

Address: Lambeth Palace, London

The hundredth Archbishop of Canterbury, the Right Reverend and Right Honourable Geoffrey Francis Fisher, was formally elected Primate of All England on January 22, 1945. In traditional manner Dr. Fisher's name was first suggested by Prime Minister Churchill '42 to King George VI '42, who then recommended the clergyman's election to the members of the Greater Chapter of the See of Canterbury. Duly elected, on February 2 Dr. Fisher was crowned Archbishop of Canterbury in St. Paul's Cathedral in London. Successor to the renowned Dr. William Temple '42, who died suddenly in October 1944, the Archbishop was invested with the highest office of the Anglican Church and is spiritual leader of forty million people. With only twelve years of active clerical service, the Archbishop at his succession was not too well known by the British public. However, he has had a distinguished career and relinquished his bishopric of London after endearing himself to the people for his work in blitzed London.

Geoffrey Francis Fisher was born May 5, 1887, the youngest son of a parish Anglican priest, the late Reverend H. Fisher, Rector of Higham-on-the-Hill, Nuneaton. The young man attended Marlborough College and Exeter College. An outstanding scholar, he won First Class Honours in Moderations in 1908. The young man also participated in campus sports and he was a useful oarsman in Oxford's 1908 Trial Eights, in which the final crew is selected for the annual Oxford-Cambridge boat race. In 1910 Fisher received his degree in the ancient classics and the same year he was awarded the Liddon Studentship. He completed his theological training at Wells Theological College in 1911. (Dr. Fisher was made an Honorary Fellow of Exeter College, Oxford, in 1939.)

The churchman's career began in the educational field when, in 1911, he returned to his old school, Marlborough College, to assume the position of assistant master. Three years later, at the age of twenty-seven, he succeeded Dr. William Temple as headmaster of Repton School, a position he held for eighteen years. He is remembered by students as "conspicuously young and spry, a firm inculcator of the classics who gave tough examinations and prescribed traditional toppers and Eton jackets." Discussing Fisher's career in education, the New York *Herald Tribune* remarked that he "had time to watch a steady stream of British youth come and go. His earliest students, from days before the First World War, have now turned fifty . . . his latest are in their twenties. To have been successful in his calling he must have learned much from them. Through them, and through his own sons . . . he must have a sense of personal contact with younger men throughout the nation. It is an unusual advantage for a man called to a position of great influence."

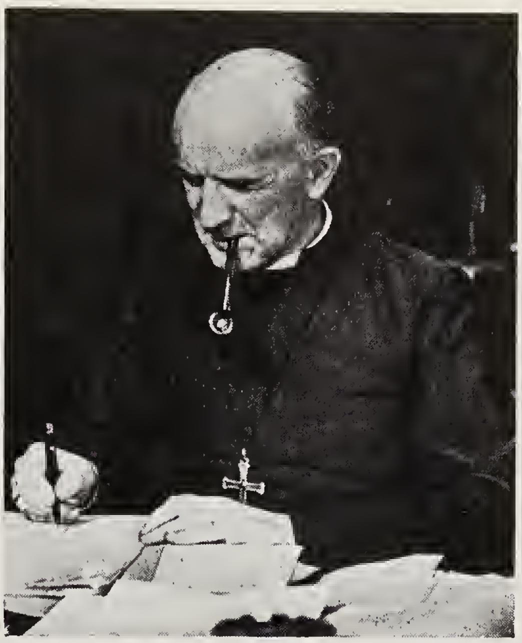
After twenty-one years as a schoolmaster Dr. Fisher became Bishop of Chester in 1932. In this capacity he established a reputation for efficiency and wisdom. The prelate prepared his sermons and church programs very carefully and made wise appointments. Thus he came to be considered by churchmen as an able and conservative administrator. When he became Bishop of London in 1939 Dr. Fisher was confronted with the complex problems of a great wartorn city. After his arrival at Fulham Palace, ancient home of the Bishops of London, war damage occupied much of his attention: he served as chairman of the Main Committee of Churches in cooperation with the Government War Damage Commission, a committee which has been concerned with the rebuilding of Britain's damaged churches. During the London blitz he sheltered three hundred persons nightly in spacious Fulham Palace, the home of Dr. Fisher and his family. In July 1943 *Time* Magazine reported that the

Bishop had begun negotiations with the ecclesiastical commissioners to halve his salary (forty thousand dollars) and arrange Fulham Palace for service as a diocesan hostel. Through these new arrangements a large part of the palace passed from his personal control and he and his family lived in comparatively small quarters.

Special steps have been taken within the Church of England since the beginning of the war to re-plan parish boundaries in areas suffering war damage or affected by population changes. Recognized as a specialist in church management and legislation, Dr. Fisher was chosen in 1943 to present the planning measure before the Church Assembly, composed of clergy and laymen. This speech earned for him a reputation for "crystal-clear exposition." Later the Bishop was called upon to preside at the Convocation of Canterbury in the absence of the incapacitated Dr. Temple. On this occasion the American bishops were presented, and Dr. Fisher—considered a restrained but powerful speaker—addressed them, stressing the bond between Britain and America and their churches. He said: "For long now our two countries have stood together against the enemies of all that our two peoples hold dear and sacred. We go forward now to victory in the West together; together we shall go on to victory in the East. Then, please God, we shall go on together to establish among the nations those high principles of brotherhood which your President and our Prime Minister have proclaimed."

Dr. Fisher has also worked diligently for cooperation among the Christian churches and is known for his efforts on behalf of interdenominational understanding. He is chairman of the executive committee of the British Council of Churches, a post which enables him to maintain contact with the leaders of all Protestant denominations in Britain. He has written sympathetically, too, about the movement for church union in southern India. In his broad ecclesiastical activities he has been a leader in cooperative efforts between Protestants and Roman Catholics. He has presided at the Joint Committee which links the Protestant "Religion and Life" movement, and the Roman Catholic "Sword of the Spirit." In addition to his duties as headmaster and Bishop, Dr. Fisher was Select Preacher at Oxford University from 1925 to 1927 and at Cambridge University in 1937 and 1940. Since 1939 he has been Dean of the Chapels Royal and Prelate of the Order of the British Empire.

In succeeding a great churchman as Archbishop of Canterbury, Dr. Fisher does not feel he has inherited the gifts of the late Dr. Temple. After his election in January 1945 the new Primate received the press and expressed this tribute to his predecessor: "My great regret is that there should be this vacancy to fill. I knew Dr. Temple from the time when I was an undergraduate at Oxford and he a don, and I am not filling his place now; there is no man in England who could do that." The press discussed the appointment of the conservative Dr. Fisher as head of the Church of England. The Manchester *Guardian* declared: "His opinions on many great questions are still hidden, for he has spoken little and written less . . . Dr. Fisher has still to prove himself." In America, *Time* Magazine declared: "Fisher has worked as hard as Temple for cooperation among the Christian churches. A better administrator, he may prove more effective than his predecessor in this respect. Another asset is his adroitness and tact. . . .And he is no stuffed shirt."



British Official Photo.

GEOFFREY FRANCIS FISHER, ARCHBISHOP OF CANTERBURY

On April 19, 1945, in the war-scarred Cathedral which had withstood innumerable air raids, Dr. Fisher was enthroned as Archbishop of Canterbury before a throng of three thousand dignitaries. Urging Church and nation to stand together in the resurrection of a peaceful world, Archbishop Fisher said, "The Church has much to put in order if it is to serve the nation. The nation has much to learn and relearn if it is to heed what God says to it through His Church."

Dr. Fisher, who rarely enters into politics, has been called a "nonpolitical bishop." In general, however, he has supported social reform, expressing his approval of the Beveridge '43 plan and educational reform measures. On one occasion he praised the Soviet Union, declaring, "We owe Russia more than we can give and more than we can pay." On another occasion, in March 1945, he commended the Conference of Missionary Societies in Great Britain and Ireland for its appeal for the removal of the colar bar in British colonies: "The only right course is that people of any race are given full opportunity of developing their proper characteristics and utilizing the opportunities that belong to all men without any barriers from outside." When the atom bomb was loosed upon Japan several months later, Dr. Fisher asserted, in an article in the *Diocesan Gazette,* that history "shows us mankind is ever accommodating its conscience to more deadly and inhuman forms of war, abandoning one restraint after another," and that "the only way of deliverance lies in the Charter of the United Nations." The unity achieved by Great Britain and the United States during the Second World War, he declared at another time, would make it possible for them "for all time" to "promote

FISHER, GEOFFREY FRANCIS, ARCHBISHOP—*Continued*

in all the world the principles of responsible freedom and good neighborliness." At the end of 1945 he criticized the limited aid Britain was giving to Central Europe and declared that it was the duty of Great Britain and other nations to save the Germans from freezing and starving that winter.

The Primate has expressed disapproval of Church participation in the peace conference after the war. Interviewed by the American Army newspaper *Stars and Stripes*, he said: "Making the peace is a political job, a job for statesmen. Inevitably it will involve compromise and conniving at compromise in a sinful world. All the church can do and should do is to keep boldly before statesmen the inflexible principles of right and wrong. That is one thing, anyhow, that all the churches of the world are agreed on."

In the early summer of 1945 a commission on evangelism which was appointed by the Archbishop of York advocated an extensive publicity campaign, calling for a fund of nearly one million dollars for use in motion picture, radio, newspaper, and commercial advertising. Another unusual method of education was announced in July, when Dr. Fisher urged a nationwide network of public bureaus, staffed by clergy, doctors, psychologists, and lawyers, to help adjust marital troubles and check an increase in the divorce rate, which he described as "a grave national problem."

In 1917 Dr. Fisher was married to Rosamond Chevallier Forman, daughter of the late Reverend A. F. E. Forman and granddaughter of Dr. A. S. Pears, once headmaster of Repton. The couple have six sons, of whom the four eldest are serving in the British Army. One son, Captain Francis Fisher, was taken prisoner at Tobruk, later escaped, and was awarded the Military Cross. The two youngest Fisher boys, Richard Temple and Geoffrey Robert Chevallier, in 1945 are at school, the latter taking a medical course at Cambridge. A popular anecdote about the Fisher family reveals that Dr. Fisher once organized a football team called Lambeth United and played on it with his six sons. Another story is told of the churchman's appearance in the Chester town square, "bishop's gaiters and all," grinding a hand organ to help raise money for the Royal Infirmary. Mrs. Fisher is also active in public affairs. In 1943 she broke precedent by being the first woman to make an address in St. Paul's Cathedral. She is president of the largest women's organization in the United Kingdom. This group, the Mothers Union, is composed of five hundred thousand women who crusade against divorce and immorality. During the Fishers' years at Fulham Palace, especially during the war, Mrs. Fisher often assisted with details of housekeeping.

For recreation the Archbishop goes walking and reads thrillers, and sometimes he and Mrs. Fisher attend the cinema. Fisher smokes a pipe, insisting, "I can't work unless I smoke." The Primate is considered "still in his episcopal prime." Noted for his executive ability, he has a tactful, magisterial manner. His democratic spirit has been evident in restrained but powerful speech. He is a short man, has thin lips, an aquiline nose, a long chin, and he wears gold-rimmed spectacles. Called a "typical English clergyman," he assumes the heavy responsibilities of his Augustinian seat fully aware of the problems of the twentieth century world.

FITCH, AUBREY (WRAY) June 11, 1883- United States naval officer; aviator

Address: b. United States Naval Academy,
Annapolis, Md.; h. 2301 Connecticut Ave.,
N.W., Washington, D.C.

Vice-Admiral Aubrey "Jake" Fitch, appointed superintendent of the United States Naval Academy at Annapolis in July 1945, has been described as "the least publicized of all the important military men" in the American forces during the Second World War. An article by Lawrence E. Watkin in *Flying* says, "There is probably no other naval officer anywhere so genuinely liked and admired both by Regular Navy and Reserve officers as Admiral Fitch"; as for his professional standing, "except for Admiral King '42 . . . Admiral Fitch has the longest sea duty record of any admiral on the active list."

The Admiral's parents, Ernest and Emily Louisa (Wray) Fitch, came from England to St. Ignace, Michigan, where Aubrey Wray Fitch was born on June 11, 1883. He attended the public schools of St. Ignace, and at fifteen entered St. John's Military Academy at Delafield, Wisconsin. When he later tried for the Naval Academy, he failed one entrance examination, according to the Baltimore *Sun*, but managed to pass the next year's. He entered Annapolis in 1902, writes Watkin; one of his fellow midshipmen "brought along with him from St. John's the story that little Aubrey had licked the class bully in defense of a Jewish kid named Jakey. They didn't believe it, but they were convinced when he remained undefeated boxer of his class all through Annapolis. Thereafter, he was known as 'Jake.'" In his first year Fitch was also on the crew and track teams, and he played football throughout the four years.

Fitch was graduated in February 1906, and served with the Asiatic Fleet for the two years of sea duty then required before commissioning, becoming an ensign in 1908. After torpedo instruction and more sea duty, in September 1911 he was assigned to the Naval Academy, where he served one academic year as discipline officer, and another as instructor in physical training. On his twenty-ninth birthday, in June 1912, Lieutenant (j.g) Fitch was married to Gwyneth Hungerford Conger. He was advanced to lieutenant the following year, while on sea duty; and in August 1914 Fitch was given his first command, the U.S.S. *Terry* and the Second Division of the Atlantic Fleet's Reserve Torpedo Flotilla. The next month the officer was assigned to the staff of the commander in chief of the Atlantic Fleet as aide and fleet athletic officer; and he also commanded the *Yankton*, tender to the Admiral's flagship, until the United States entered the First World War in April 1917.

That September Fitch became gunnery officer in the *Wyoming*, which operated with the British Grand Fleet's Sixth Battle Squadron from December 1917 until the surrender of the German Fleet in November 1918. During the war he was promoted twice, to the temporary rank of commander; and after the war, while again on duty at the Naval Academy, he was commissioned as regular lieutenant commander. His four months at Annapolis were followed by two years as head of the Naval Ammunition Depot in Hingham, Massachusetts. Then the Commander went back to sea as skipper of a minelaying destroyer and commander of a minelaying division, comprising the *Luce* and *Mahan*. Next came diplomatic duty, with the future admiral a member of the United States mission to Brazil from December 1922 to March 1927, working with the Brazilian Navy. In November 1927, after six months as executive officer on the *Nevada*, Fitch assumed command of the *Arctic*.

At the age of forty-six Commander Fitch applied for flight training, and attended the famous naval air school at Pensacola, Florida, where his young classmates nicknamed him "The Gray-haired Ensign." The nickname is well remembered, as is the fact that he made a perfect landing on the flight deck of the carrier *Langley*—except for forgetting to lower his landing hook. After having won his wings in February 1930 and commanded the *Wright* for a time, Fitch went to the *Langley* as her skipper. In July 1931 he was advanced to the rank of captain, and a year later assumed command of the Norfolk Naval Air Station. From June 1935 to April 1936 Fitch was on the oldest and largest American aircraft carrier, the *Saratoga*, as chief of staff to the commander of the fleet's aircraft battle force, leaving this post to take over command of the *Lexington*. In 1937 Captain Fitch entered the Naval War College at Newport, completing the senior course in May 1938. (He has also taken its corrrespondence course in strategy and tactics.) He spent the next two years as commandant of the huge Pensacola station. Following this assignment, Fitch was given command of Patrol Wing Two in May 1940, made a rear admiral in July, and transferred in November to command of the fleet's Carrier Division One, with the *Saratoga* as his floating headquarters.

Less than four months after the attack on Pearl Harbor he was commanding a task force of Admiral Chester W. Nimitz' '42 crippled Pacific Fleet. As such, Fitch took part in the battle of the Coral Sea on May 7-8, 1942—perhaps the first step of that phase of the Second World War in which "the battered Allies, with meager equipment and great courage, managed by the skin of their teeth to bring the Japanese advance to a halt." His airmen outfought two Japanese task forces, but this battle, off the Solomons, northeast of Australia, cost the Americans the old *Lexington*. (Almost the only time Fitch's staff officers have ever seen him "blow up" was when his orderly offered to let the fifty-eight-year-old Admiral precede him off his doomed ship.) "I had the honor to be sunk in that engagement" is the way Fitch puts it; but others say that the decision to abandon the crippled ship made it possible to save the lives of twenty-seven hundred members of the crew. Fitch's "outstanding leadership" and "the courageous devotion to duty of the units under his command resulted in the sinking of one enemy Japanese carrier, the serious damaging of another, and the sinking of one enemy cruiser." (This is quoted from the citation accompanying his Distinguished Service Medal.)

U.S. Navy

VICE-ADM. AUBREY FITCH

In September 1942 Fitch assumed duty as commander of the South Pacific Fleet's aircraft; and when, in December 1943, he was appointed vice-admiral (temporary), the promotion was made retroactive to December 1942. "Overcoming tremendous obstacles in the early phases of offensive operations, he skillfully coordinated Navy, Marine Corps, Army, and New Zealand air units during an extended period of intensive combat, striking fiercely at the enemy and causing terrific damage to Japanese shipping, aircraft, ground troops, and installations, with proportionally light losses to the forces under his command." At Fitch's headquarters there was not, reportedly, one single publicity officer or newspaper correspondent, with the result that the public hardly knew his name. Nevertheless, the accomplishments of those South Pacific fliers under the leadership of Admiral Fitch make "one of the most fascinating narratives of modern warfare," writes Watkin. "It had to be smart to succeed. With the decision to lick Germany first, and because Guadalcanal had been slow and costly, only a shoestring allotment was doled out to the continuing Solomons operation. Yet this handful of planes not only cut a swath all the way up from Guadalcanal to Munda to Ondonga to Barakoma to Stirling to Torokina to Green Island, but it managed to take on all the planes the Japs could send from the great supply center at Rabaul. When Rabaul was drained the enemy flew in fighters and bombers from the near-by Carolines, and finally all that could be

FITCH, AUBREY—*Continued*

spared from the Empire itself. The Fitch fighters knocked them all down impartially. . . . Admiral Fitch himself disclosed that between September 1, 1942, and May 1, 1944, Americans and New Zealanders under his command shot down in aerial combat 3,031 Jap planes out of the Pacific skies."

Jake Fitch is credited by Watkin with the strategy behind the Solomons campaign of island bombardment, followed by invasion and immediate use of captured areas as the base for further air operations. Fitch himself, to quote the citation for the Distinguished Flying Cross, "performed numerous hazardous flights in the combat zone of the Solomon Seas area and the Coral Sea for the purpose of inspecting air activities and incident to the selection and development of bases for projected operations." "Throughout this many-sided land-based warfare," adds Watkin, "Admiral Fitch was an ever-present inspiring figure. . . .He was among the first ashore when Munda was seized. In the rough days at Guadalcanal he landed time after time on Henderson Field, while the Japs were firing mortars down the strip." At Green Island he landed the first plane; and once, when he thought the fliers at his advanced outposts might appreciate a concert, he "bundled his band [a prerogative of three-star rank] into a Skytrain and took it along. . . .He made it a point to find out for himself if the men had enough handball courts, if the Ships Service was open at hours when they could best use it, if there was enough pogey bait—candy—for all. He saw to it that the ice-cream machine was putting out its three-ton maximum of gedunks every week." When Fitch was ordered back to Washington in August 1944 to become deputy chief of naval operations for air, he had won a D.F.C. from the Army, a Gold Star in lieu of a second D.S.M. from the Navy, and a placque of appreciation from the islanders.

Despite the importance of his new job, in which he supervised all Navy aviation, Fitch remained unknown to the public. The only news he made was his receipt in July 1945 of Brazil's National Order of the Southern Cross in the degree of Grand Officer, awarded in recognition of his services as a member of the American Naval Mission twenty years earlier. Another brief announcement appeared in the papers that August, when the Admiral became the thirty-fourth superintendent of the Naval Academy, the second of his rank. As such, he was also commandant of the Severn River Naval Command.

The first airman to head the Academy, Fitch announced: "After this year every man who graduates from the Naval Academy either is going to become an aviator or is going to have a lot of knowledge and a great respect for air power." He started the Academic Board working on plans for a department of aeronautics, construction of a landplane airport near Annapolis, and enlargement of the existent seaplane base. Midshipmen who wished to specialize in aviation would not, however, be able to win their wings at Annapolis, as Army cadets could at West Point, but would have to fulfill the required "hitch" of sea duty after graduation before flight training at Pensacola. At the end of the year (1945) he said that the Academy hoped to increase its capacity to a possible seventy-five hundred midshipmen a year, double its wartime quota.

Superintendent Fitch is described as a kindly, quiet man, democratic and unpretentious. Of slight stature, he is nevertheless "barrel-chested," and at the age of sixty he demonstrated to his officers how to "lick the daylights" out of a punching bag. He can take "kidding" from his colleagues, or his three sons, all of whom were in the Naval Reserve in the Second World War. An Episcopalian, Fitch is a member of Delta Sigma Nu and of three clubs—the New York Yacht Club, the Racquet Club of Philadelphia, and the Chevy Chase Club of Washington. His favorite song is reportedly "God Bless America," and his favorite reading is Zane Grey's Westerns. Fitch is described, too, as the most avid football fan to head the Academy.

FITZGERALD, BARRY Mar. 10, 1888-
Actor

Address: b. Paramount Pictures, Inc., Hollywood, Calif.

Catapulted to cinema heights by his portrayal of Father Fitzgibbon in *Going My Way* (1944), Barry Fitzgerald is unmoved by his sudden rise to fame and fortune. A distinguished veteran of the renowned Abbey Theatre of Dublin, he had hitherto been given only supporting roles in motion pictures since his arrival in Hollywood. The new star, a fifty-six-year-old "nutcracker-faced" little Irishman, is no advertisement for celluloid romance or glamour. Shy and retiring by nature and wise through years of diversified experience, he is unaffected by the glitter of the Hollywood spotlight.

This Irish actor was born William Joseph Shields on March 10, 1888, in Dublin. His father, Adolphus William Shields, was a newspaperman of sober habits; his mother was the former Fanny Ungerland. The family was large and, in the son's words, they were "always pretty hard up." Dublin-educated at Merchant Taylors Endowed School, and Skerrys College, young William Shields was trained for the British Civil Service. He explains this choice of profession: "It was the one into which most of the families of our grade in my young days tried to stow away their progeny, as it gave security, a fair living, and a certain social status." But he found the work dull and devoted his spare time to sports, to active participation in boxing, swimming, and football. The flowering Irish literary movement also interested him, an interest stimulated by an early acquaintance with James Joyce.

At the suggestion of his brother Arthur, who was attending the acting school of the Abbey Theatre, Fitzgerald often visited that famed Irish institution. Of this portentous period of his life Fitzgerald candidly comments: "I went frequently to the Abbey Theatre, of course, and once when I was invited backstage to meet some of the players, I was roped in to play a walk-on the following week. I played walk-ons frequently, never having the energy to go away and do something useful in my spare time. It became a habit. I got to know the players well and met many notable and interesting people. It was fun, but I didn't take it seriously and neither I nor anyone else thought I had the least talent for the stage." He spoke his first lines in Sheridan's play *The Critic*. He had four words to say: "'Tis meet it should." Terror twisted his tongue, and he recited: "'Tis sheet it mould." Thus through a ludicrous blunder, he says, was launched his career as the comedian Barry Fitzgerald—for he adopted this pseudonym for fear of losing his civil service job.

For twenty years Barry Fitzgerald played the dual role of civil servant by day and actor by night. To learn his parts he studied during lunch hours and in stolen minutes at his desk. Of this unusual initiation into the theater he remarks: "I had very short and scrappy rehearsals, but the regular players cooperated, and we did all right. Since those days I have rehearsed plays in London and New York for six weeks and nearly died of boredom before the plays opened." Playing many character types, he learned his art thoroughly and in time became a leading member of the Abbey Theatre group. He acted in the plays of the contemporary Irish masters, O'Casey, Synge, Yeats, Dunsany, and he played characters created by Pirandello, Molnar, and Strindberg.

This was the period of the Irish Easter Rebellion of 1916, and the revolutionary fervor of the times inspired many of the day's dramatic offerings. Thus Sean O'Casey's most popular plays, *The Plough and the Stars* and *Juno and the Paycock*, treated the tragic Irish theme with dynamic passion. Fitzgerald played leading roles in these productions and on occasion witnessed violent audience reaction. With the Abbey players he also appeared in a group of Bernard Shaw '44 plays. Later he accompanied the group on a tour throughout England.

The Abbey Theatre has long enjoyed an enviable reputation. The rigid and thorough apprenticeship demanded by its high standards and extensive repertoire commands critical admiration for its graduates. However, today Fitzgerald says that it was not the Abbey Theatre that made him a successful character actor. Insisting that character delineation cannot be learned by studying acting, he claims to have mastered his profession by studying people. When he studies a part he attempts to absorb the character instead of merely memorizing the dialogue. In his opinion pantomime is the best acting. Thus his screen characterizations are always distinctively animated by personality traits of face and figure.

In 1929 O'Casey wrote *The Silver Tassie* especially for Fitzgerald and persuaded the actor to play the leading role in London. It was a difficult decision for Fitzgerald to make. He was reluctant to discard the security of job and pension for the vagaries of the theater. But he chanced the leap and at forty became a full-time professional actor. Later he rejoined the Abbey players for their American tours. Following the Broadway seasons the company made extended road tours throughout the United States. In this way, playing in many cities and small college towns, Fitzgerald became familiar with the American scene. He prides himself on this knowledge and claims to know the topography of the continent better than most Americans.

BARRY FITZGERALD

In 1936 the director John Ford '41 brought Fitzgerald to Hollywood to do RKO's film version of *The Plough and the Stars*. The money Fitzgerald earned from this venture was spent on a vacation. He was preparing to return home to Ireland when Mary Pickford '45 offered him a year's contract, which he accepted. Thereafter he remained in America, alternating his film career with periodic returns to Broadway. Working for the major studios, he appeared in several pictures, but his early film career was unspectacular. His talent helped sustain several undistinguished pictures wherein he made the smallest part significant. More recently Fitzgerald contributed memorable performances to such notable films as Walter Wanger's *The Long Voyage Home* (1940), based on a series of Eugene O'Neill's plays, Twentieth Century-Fox's *How Green Was My Valley* (1941), adapted from Richard Llewellyn's '40 book, and RKO's adaptation of another Llewellyn novel, *None But the Lonely Heart* (1944).

Returning to his first love, the stage, in 1939 Fitzgerald appeared on Broadway in Paul Vincent Carroll's *The White Steed*. In this play he first attracted the attention of Leo McCarey, future producer and director of *Going My Way*. Later Fitzgerald and Sara Allgood, his former colleague in the Abbey Theatre, revived their famous roles in *Juno and the Paycock*, to the delight of New York's drama critics. As Captain Jack, Fitzgerald tied with Alfred Lunt '41 for the critics' choice of the best performance of the 1939-40 season. Then again on Broadway in 1941, he and his brother Arthur Shields appeared in Jack Kirkland's presentation of *Tanyard Street*. Thus Fitzgerald's reputation as a first-rate artist of the stage had long been established before he won acclaim as a film actor.

With the advent of Paramount's *Going My Way* the middle-aged Dubliner became a phenomenal success. The critics were unanimous in their high praise of his profoundly human

FITZGERALD, BARRY—*Continued*

portrayal of the petulant old priest. One critic called it "one of the great performances of our time," and Archer Winsten offered this glowing testimony: "Fitzgerald's portrait of the aged priest is by far the best character work of his career, and he has not been without distinguished work in the past. It is so memorable that people will be harking back to it for years." The reviewers rejoiced that Fitzgerald had finally been given a role "worthy of his talent."

Going My Way was hailed as a "picture of rare excellence" and Fitzgerald shared the eloquent commendation with Bing Crosby '41 and producer-director Leo McCarey. This applause was a double victory for Fitzgerald, for the New York Film Critics voted his performance the best of the year and also voted *Going My Way* the best picture of the year. Lastly, in March, at the annual presentation of awards made by the Academy of Motion Picture Arts and Sciences, the film won nearly every major award, and the actor was named the best performer in a supporting role. (Because of the convincing characterization Fitzgerald gave of the Roman Catholic priest, people are often surprised to learn that the actor is actually a Protestant. His interpretation of kindly Father Fitzgibbon is based on a composite character drawn from several clerical friends.)

Until *Going My Way*, Fitzgerald had been given supporting roles in pictures, chiefly to supply comic color. Now he is in demand by the biggest studios and the choicest roles are sought for him. He was starred in the musical *Stork Club*, with Betty Hutton, and in the Agatha Christie '40 multi-murder *And Then There Were None*. Films announced as in preparation at the end of 1945 that would feature the Irish actor were *Third Avenue*, in which his brother Arthur was to portray his screen brother, and *California*, co-starring Ray Milland and Barbara Stanwyck. He was signed to a long-term contract by Paramount, and his salary was reportedly tripled. He also branched out into radio, in October 1945 beginning a series over NBC called *His Honor, the Barber*, written by Carlton E. Morse.

Fitzgerald has become a Hollywood legend overnight but he remains indifferent to the furor. In the wake of his rise to stardom the usual stories of his professional peculiarities arose. He quickly squelches such tales of his alleged idiosyncrasies which rumor breeds prolifically in imaginative movieland. Fitzgerald prefers to remain what he is—a simple man of humble tastes and modest desires. A bachelor, he lives in a rented bungalow with his Iroquois Indian friend and aide, Gus Tallon, who performs the divers duties of stand-in and houseman. The mainstay of the household, says the actor, is his cook Mrs. Cade, who, he hopes, will not "up and quit" as callers increase. Arthur Shields, Fitzgerald's brother, is now also a movie actor, and the two Abbey alumni often have dinner together. Fitzgerald is of small build, five feet three inches tall; he is blue-eyed and has graying blond hair and an aggressive jaw. The advancing years find him youthfully active and still riding to work on his motorcycle, despite the worried protests of studio officials. While his golf is admittedly way over par, it is nevertheless a satisfying source of relaxation. Fitzgerald's favorite hobby is music—he started piano lessons at fifty and still takes lessons twice a week. He enjoys practicing Bach, Beethoven, and Brahms, a habit that has not always pleased neighbors. Kyle Crichton reveals that on several occasions the actor "has been asked by other tenants to please pipe down. Hence, the present bungalow where he can play without being hated."

Barry Fitzgerald is given to a simple way of living. Characteristically, he prefers the quiet comfort of an evening at home with book and pipe to the livelier diversions that Hollywood offers. As a Hollywood star, he is deprived of much of the privacy he formerly enjoyed. He resents this intrusion on his mode of life and frankly declares that being a Hollywood celebrity is "downright boring." Fred Stanley, in his New York *Times* article of January 14, 1945, gives his impression after interviewing Fitzgerald: "He is surprisingly casual and relaxed. He impresses one as an intensely modest man gifted with a curious, searching mind. There are numerous clues that he and his characterizations, as many interviewers have noted, are cut from the same cloth." Fitzgerald's personality has shaped his art, for he likes people and enjoys making them laugh.

FOSDICK, RAYMOND B(LAINE) June 9, 1883- President of Rockefeller Foundation; lawyer

Address: b. Rockefeller Foundation, 49 W. 49th St., New York City; h. 25 E. 83d St., New York City

President of the Rockefeller Foundation, which contributes some ten million dollars annually to "promote the welfare of mankind throughout the world," is Raymond B. Fosdick, a New York lawyer and social thinker who was the first under-secretary general of the League of Nations. He shares with chairman of the board John D. Rockefeller, Jr., '41 the major responsibility for allocating the funds—funds used to wipe out a dreaded plague in Brazil, to help in the reconstruction of China, to assist institutions, to support the researches of scholars the world over.

A descendant of Puritans, Raymond Blaine Fosdick was born in Buffalo, New York, on June 9, 1883, to Frank S. and Amie I. (Weaver) Fosdick. His father, the forward-looking principal of a Buffalo high school, since 1870 had been a believer in evolution; his elder brother (by five years) was Harry Emerson Fosdick '40, later known as the Baptist pastor of the Riverside Church in New York. Young Raymond Fosdick studied at Princeton University, receiving his B.A. in 1905 and his M.A. in 1906, and was elected to Phi Beta Kappa. Then he went on to the New York Law School. Graduated with his LL.B. in 1908, Fosdick became assistant corporation counsel for the City of New York under Mayor George Brinton McClellan. In 1910 he was made Commissioner of Accounts, a post he held for three years. That December the twenty-seven-year-old lawyer was married to Winifred Finlay of Montclair, New Jersey; they had two children Susan and Raymond Blaine, Jr.

Described by *Time* as "the sort of genial, persuasive, energetic man who takes naturally to public life without becoming a politician," Fosdick was asked by the Rockefeller Bureau of Social Hygiene to make a comprehensive study of European police systems, which he began in 1914. (The findings were published, as *European Police Systems*, in 1915.) Then he turned his investigating activity to the American police system; but wartime conditions forced him to leave this task in 1916, to act as special representative of the Secretary of War, Newton D. Baker, on the Mexican border. (*American Police Systems* was finally published in 1920.)

RAYMOND B. FOSDICK

The day after the United States declared war on the Central Powers in April 1917, Fosdick was sent to Canada as chairman of the Commission on Training Camp Activities of the War and Navy Departments. After studying the Canadian methods, he made similar inspections in France and England, and then in the United States. "We had to extemporize our technique and our method of operation as we went along," he says. "There was no recent experience to guide us. It was all new and untried to us, with the Civil War, fifty years before, the last great war which we had fought." *Keeping Our Fighters Fit*, written in collaboration with E. F. Allen, came out in 1918.

In that year Fosdick was sent as special representative of the War Department to France, where he remained as civilian aide to General Pershing. When the League of Nations was formed President Wilson assigned the New Yorker to it, and Fosdick became the first under-secretary general. To his disappointment, the Senate refused to ratify the League Covenant, and in 1920 Fosdick resigned from that office. Back in New York, he practiced law as a member of Curtis, Fosdick, and Belknap. A constant supporter of the League, he soon founded the League of Nations Association.

In the sixteen years of Fosdick's practice in New York City, he was active in social and philanthropic work, as well as in the promotion of internationalism. A member of the national, state, and city bar associations, he was on the executive committee of the last; for a time he served in the Phi Beta Kappa Senate; and he was active in the American Institute of International Law and the National Institute of Social Science. In 1925 he was awarded the LL.D. degree by both Colgate University and Colorado College. By 1930 Fosdick had been

FOSDICK, RAYMOND B.—*Continued*

elected trustee of seven important public service organizations: the Rockefeller Foundation (in 1924), the Rockefeller Institute for Medical Research, the Rockefeller General Education Board, the International Education Board, the Spelman Fund, the Brookings Institution, and the National Institute of Public Administration.

In 1928 a group of addresses given by Fosdick before various scholastic audiences was published as *The Old Savage in the New Civilization.* Here he sets forth the basic ideas of his thinking: "Modern science has revolutionized, not man, but his world. . . .He remains as he was and always has been—irrational, impulsive, emotional, inherently conservative to change, bound by customs and traditions which he will not analyze, the victim of age-old conventions and prejudices. . . .Suddenly armed to the teeth," this old savage "is asked to live in peace, crowded together with [international] neighbors whom he never knew before and for whom he has no particular liking. And all this has happened in a hundred years—happened so quickly, in fact, that it finds the race utterly unprepared in point of religion, ethics, law, philosophy, economics, politics, and government to meet the exigencies that have arisen. That is the challenge that we face in our generation. It is a challenge the answer to which must not be postponed."

In February 1933 Fosdick and Albert L. Scott undertook for John D. Rockefeller, Jr., a study of liquor control, which involved field investigation in twelve countries. Findings were published, as *Toward Liquor Control,* in that year, and the recommendation was for the establishment of state liquor authorities with a monopoly on liquor trade, plus the elimination of all but Federal taxation, which revenue could be shared with the states by prearrangement. Two years later Fosdick was elected president of the Rockefeller Foundation, on the retirement of Max Mason, and also president of the General Education Board, to succeed Trevor Arnett. (Widowed in 1932—his wife and their two children died under tragic circumstances—the fifty-three-year-old lawyer was married in April 1936 to Elizabeth Miner.)

Raymond Fosdick entered upon his two presidencies in July 1936, with the special duty of preventing the Board's activities from overlapping the Foundation's, and with the special problem of liquidating the Board over a period of years. (In 1945 it was still in the process of liquidation, with the prospect that the actual termination would be some years later.) "His first year as the Foundation's president," in the words of *Time,* "saw no sensational shifts of Rockefeller procedure but a continuation and broadening of traditional policy. His administration was proving quite satisfactory to his trustees, and there was a note of crispness and dispatch in the Rockefeller Center offices which would have gladdened the Baptist heart of old John D., Sr., who died during Mr. Fosdick's first year."

As president of the Foundation, of which he had been an adviser since its establishment in 1913, Fosdick was entrusted with assets totaling nearly two hundred million dollars—$185,000,000, of which $11,300,000 were disbursed during his first year. Grants were made in 1936 to 130 agencies in fifty-four countries, including forty-one national or local governments, forty-four educational institutions, twenty research institutes, and twenty-three councils, associations, societies, and commissions. Fellowships were provided for seven hundred graduate students, and research funds for 222 scholars; while the Foundation's seventy public health experts, the International Health Board, carried on research against eight dangerous diseases. Some of its most important work was done against malaria; Foundation workers discovered the most dangerous carrier, the mosquito Anopheles gambiae of Africa, and a staff member, Dr. Fred L. Soper, directed the Brazilian Government's "offensive" against malaria, which by 1940 resulted in the eradication of the mosquito in that stricken country. Important work against yellow fever was also accomplished; Rockefeller researchers discovered and compounded the only prophylaxis against that scourge, a vaccine of which the Institute prepared a million units in 1940.

Fosdick was in the habit of making frequent visits to the Foundation offices in Europe, particularly those in Paris and London. The outbreak of the Second World War, which he had worked in vain to prevent by urging the establishment of a true world court to settle international disputes, curtailed his travel and the Foundation's work all over the world. In 1940 the Paris office had to be moved to Lisbon, and the Shanghai office (ironically, as later events proved) to Manila. "Our personnel," Fosdick reported for that year, "has had to be recalled from Egypt, where work was being carried on in malaria and schistosomiasis; from Turkey, where we were engaged in sanitary engineering; from Rumania, where scarlet fever studies were being conducted; and from Hungary, which was a station for influenza research However, Foundation personnel was still operating on the Burma Road, in India, in South China, in the Belgian Congo, in Uganda, Central Africa, in Spain, Portugal, and of course in Latin America"—as well as in the English-speaking countries.

Fosdick is acutely aware that "the condition of university life and standards on the Continent is now little short of appalling," and feels that the intellectual life of the world "cannot without disaster be broken up into separate parts. If . . . Europe freezes into an Arctic night," he has written, "we shall not easily keep the fires lit in the universities and laboratories of America." In 1940 alone the Foundation granted a total of $266,350 to further the work of fifty-six scientists, refugees from the Nazi terror in Germany and ten other countries; $100,000 to train selected British medical students in American institutions. Since the beginning of the war the Foundation "had had the privilege of keeping fundamental research alive," making grants to the great Swedish, Swiss, and British social science institutes, and to the research projects of individual chemists, biologists, and physical scientists. All this work in pure science is in addition to such practical applications by Foundation workers as the preparation of influenza and yellow fever vaccines for the Allied troops, and reconstruction in China. "That fundamental research can be maintained in countries where the shock of war is ever present," said Fosdick in 1944, "is in these dark days a refreshing reminder of the power and persistence of creative intelligence."

In the annual report of the Foundation for 1944, Fosdick disclosed that it had established an unusual number of scholarships and fellowships for returning veterans. He stressed the need for study of economics. sociology, anthropology, and other social sciences, explaining that, "because war tends to substitute fear for reason and propaganda for truth, imperative necessity requires the support of the agencies and the spirit which makes for nonpartisan understanding in the field of human relations."

As president of the General Education Board, Fosdick announced new appropriations during 1944 of $3,073,976, approximately two-thirds of which went to advance Negro education. He said the greatest need was to train better teachers and leaders in education, while he predicted that Negro colleges and universities would see a period of expansion unprecedented in their history. He cited Army examinations as revealing "a far from perfect record in simple literacy," and said American colleges face conversion problems as difficult as those of industry.

Since 1941 Fosdick has been a member of the Joint Army and Navy Committee on Welfare and Recreation, for which he again inspects camps and bases. A Wilson Democrat politically, he remains an advocate of that internationalism which he sees as the only way to a solution of man's inescapable problems. His experience with such world-traveling scourges as malaria and influenza "poses," he says, "a problem of larger significance which cannot be evaded. . . .The nations of the world face these enemies of mankind, not as isolated groups behind boundary lines, but as members of the human race living suddenly in a frightening propinquity. Some kind of regularized international cooperation is essential [to their control]."

Fosdick made a plea for success of the United Nations Conference when he wrote in the New York *Times Magazine* in April 1945: "Modern science has at last brought us face to face with a decision which we can no longer evade. Thanks to our chemists and physicists, war as a method of settling disputes between nations has become so monstrous in its destruction that it is now a vast canopy of death spread over a blackened and smoking world." In another *Times* article he wrote further that, while "our first defense must inevitably be the United Nations Organization," it "is not an automatic device. . . .[It] must be built on a realization of the common interests which bind men together everywhere and of the common dangers which confront us as members of the same human race. . . .In spite of the atomic bomb we are still the captains of our own destiny, and we can make that destiny anything we desire."

"War worker, peace advocate, internationlist, social science promoter," Raymond Fosdick is described by *Time* as "first and foremost a lawyer," and by *Newsweek* as "a good conversationalist, genial, witty, and generous . . . equally popular playing games with children or discussing international affairs with statesmen." His services have been rewarded with the Distinguished Service Medal, two doctorates, the rank of Commander of the French Legion of Honor, and election as a Fellow of the American Academy of Arts and Sciences and as a member of the American Philosophical Society. His clubs are the Century and the Union Interalliée. In December 1945 he was made a member of a committee to study atomic energy which was appointed by the Carnegie Endowment for International Peace.

FOSTER, WILLIAM Z(EBULON) 1881-

Communist leader; author

Address: b. Communist Party, 35 E. 12th St, New York City

Veteran labor leader and long a prominent American Communist, William Z. Foster in 1945 was once again in the news spotlight, for in July, at the convention of the Communist Political Association, Earl Browder '45, long-time Communist leader, was deposed, and Foster became national chairman of the organization, now known once more to the world as the Communist Party. "America's foremost radical has played a militant part in struggles of the labor movement since 1894. Three-time Communist Presidential candidate, he has written scores of pamphlets and is the author of six books. Self-educated and well-traveled, he was for many years an industrial worker, a seaman, and, during the turbulent birth of industrial unionism, an organizer. Hard work and danger have filled his action-packed career as a revolutionary. Once termed "an engineer of the labor movement," Foster in his time has been "orthodox and outlaw, regular and rebel."

The Communist leader is a New England Yankee of humble origin. The son of an Irish railroad car washer, William Zebulon Foster was born in Taunton, Massachusetts in 1881. He grew up in the slums of Philadelphia, to which the family had moved when he was six, and there the boy joined one of the street gangs, the "Bulldogs." At the age of seven he began to work, selling newspapers to contribute to the meager family income. At nine he applied for a job at Wanamaker's department store, where he was advised to "grow up first." When he was ten he was apprenticed to an artist, from whom he began to learn such art crafts as modeling and stonecutting.

But after three years he gave up this work. "I felt no call to a life of art," he explains; "I wanted to become an industrial worker and was drawn as by a magnet to the shops." Thus, at the age of thirteen young Foster entered a period of more than twenty years during which he worked in seven different industries in various parts of the country. For three years he worked for the American Type Founders Company, where he became "saturated with lead." From 1898 to 1900 he worked in the fertilizer industry, at such jobs as laborer, steam fitter, fireman, engineer, and skilled fertilizer mixer. But this work was dangerous to health: the combination of garbage, dust and chemicals was a menace to the workers. He left, going to Havana, but finding economic conditions bad, he returned to look for work in Florida. After working in several Florida lumber camps,

WILLIAM Z. FOSTER

he traveled on to New York, where he spent some months working as a motorman on the Third Avenue Trolley lines. But when he joined the union he was again without a job. (At that time union membership meant discharge.)

Failing in health, the New Englander then signed on square-rigged merchant ships, working as an able-bodied seaman. He sailed once around the world, and spent considerable time on the coasts of Africa, Australia, and South America. "Three years of knocking over the world in windjammers finally put me back on my feet again," he says. From this period, 1901-04, Foster has exciting tales to tell of the experiences of seafarers and of the practice of shanghaiing men to make up crews. When he returned from his marine adventures in 1904 Foster found his way to Oregon where he became a homesteader with a claim high up in the rugged mountain country. During the period he owned this land he continued his work in lumber camps and on railroads, and after three summers he sold his land. He then took a "fling" at sheepherding in 1907, followed by another turn at railroading.

In these early years as a laborer, Foster says, he found the truth of the Marxist principles he was later to adopt, and his revolutionary ideology developed. He learned the theory of the class struggle and was convinced that "the way people get their living determines their social outlook." He had joined the Socialist Party in 1900 but was expelled nine years later when his ideas no longer conformed with the party line. In 1909 he was a member of the Wage Workers Party in Seattle and that year he joined the Industrial Workers of the World. This group aimed at socialism through industrial unionism, endeavoring to organize all workers, skilled and unskilled, into one great body. As a member of the I.W.W. Foster took part in many labor and free-speech fights and was a leading writer and orator of the organization. He once participated in a secret organizing drive in a mining area and after a month he was driven out of the district by armed company guards.

In 1910 Foster went to Europe, where for thirteen months he studied the labor movements, principally in France and Germany. He was especially influenced by the French labor movement and learned much from the Confédération Générale du Travail. Returning to the United States, in the summer of 1912 he found work as canvasman for a tent show. He took this job with the traveling theatrical group in order to have time to write his first pamphlet, *Syndicalism*, in collaboration with Earl Ford. The pamphlet outlined the principles and program of the Syndicalist League of North America which he had founded with Ford and of which he had become secretary. This radical group was active within the trade unions but took no part in political action. Its work was of considerable importance for a period, but after two years the organization ceased to exist. While working in various capacities as a railroader, Foster devoted all his spare time to reading and writing. His eyes became affected, almost to the point of blindness, and only after three years of trial remedies did an operation restore his sight.

During most of the years 1904-16 the wandering worker traveled around America "on the hobo." He covered thirty-five thousand miles on the railroads, becoming familiar with the life of migratory workers and the vast American scene. Although it was his plan to find work and see the country, he traveled mainly for "revolutionary agitational purposes." Foster found that "industrial workers as a whole react the same toward the basic problems that confront them in industry, yet they have considerable minor differences in psychology." In *Pages From a Worker's Life* he explains the causes for the different outlooks of the needleworker and the steelworker, the sailor and the packinghouse worker.

As a vigorous partisan of labor, Foster played a vital part in numerous strikes in many industries, affiliated at various times with the I.W.W., the A.F. of L., the Railroad Brotherhoods, the Trade Union Unity League, the CIO, and independent unions. In 1915 he was the business agent of a Chicago railway union. The following year he again attempted to organize the radical element within the trade union movement by establishing the International Trade Union Educational League, an organization which acquired little influence, however, and expired in 1917. This was the period of the rising tide of industrial unionism, which found Foster in the vanguard. In 1917-18 he was one of the leaders in the organization of the packinghouse workers, the first mass production industry to be completely organized on a national scale.

As an A.F. of L. organizer, Foster was a leader in the campaign in the steel industry, which culminated in the great steel strike of 1919, a bloody episode that held the Nation's attention for months. According to the *Journal of Political Economy*, the organizer demonstrated "remarkable ability" in the steel campaign, and the *New Republic* called his work "a miracle of organization." This was the period of Attorney General A. Mitchell Palmer's "Red raids," when the strike was pictured by enemies as a revolutionary overture. Foster was attacked in the anti-labor press as a Red menace; his past affiliations and opinions, especially his pamphlet on syndicalism, were used to discredit him and the strike. When examined by a Senate investigating committee in connection with the strike, Foster revealed that his main source of opinion on social affairs was then the work of Lester F. Ward, pioneer American sociologist.

In November 1920 Foster founded the Trade Union Educational League, which carried on propaganda work designed to direct the trade-union movement toward industrial unionism and independent working-class political action. According to an analysis of the organization in the *Journal of Political Economy* in 1925, the T.U.E.L. considered the development of fascism an international menace to the labor movement. The group functioned as an auxiliary of the unions, with branches in the principal cities and industrial centers of the United States and Canada. Its ultimate goal was the abolition of capitalism and the establishment of a workers' republic. As national secretary of the T.U.E.L., Foster participated in many significant labor campaigns. In the summer of 1921 he and Earl Browder '44 attended the congress of the Red International of Labor Unions in Moscow as delegates from the T.U.E.L. The following year when the T.U.E.L. initiated a movement in the Chicago Federation of Labor for amalgamation of craft unions into industrial unions, Foster led the controversy with Samuel Gompers of the A.F. of L., a battle in which Gompers succeeded in keeping the craft status of the A.F. of L. In 1926-28 Foster was active on behalf of the United Mine Workers of America and participated in the 1931 coal strike, which he reports as "one of the severest strike tests" he ever witnessed.

On his return from the Moscow conference, Foster joined the Communist Party. The C.P. had been formed in 1920 after a split within the Socialist Party, and Foster had previously met with the executive council of the underground C.P. During the postwar "Red scare" era, Communist meetings were broken up and members arrested. Such action led to the formation of the milder-sounding Workers Party of America in 1921 while the Communist Party continued to function underground. In April 1923 this underground organization was dissolved and merged with the legalized Workers Party which later again became the Communist Party. During his many years of association with the Communist organization Foster has been "in the thick of all the bitter factional rows" and has always emerged successful. Internal party controversies, such as the Foster-Ruthenberg and the Foster-Lovestone disputes, have been widely publicized. Foster was arrested for his participation in a secret Communist convention in Bridgman, Michigan, in 1922. Indicted for criminal syndicalism, he was freed when the trial ended in a jury disagreement. The case attracted wide attention; according to Robert Morss Lovett '43, who reported the proceedings in the *New Republic,* "it may be that the result of the Michigan trial is after all a victory for the people."

After a futile attempt to organize a farmer-labor slate for the elections of 1924, the Workers Party ran their own candidates. As candidate for President on the first Communist ticket in the United States, Foster polled 33,000 votes. Running for the same office in 1928 he received 48,000 votes, and in the depression election of 1932 the Communist candidate polled 55,000 votes.

After a brief period as general secretary of the C.P., in 1930 Foster relinquished this position because of poor health and became chairman. That year he was his party's candidate for Governor of New York. During that same year Foster spent six months in a New York penitentiary for participating in a Union Square demonstration of the unemployed in March after the police had refused to issue a permit for the gathering. As a revolutionary, he tells of other experiences he had with armed guards, vigilantes, and police, including kidnapping by the Colorado Rangers and, he reported, the third degree at the hands of the Los Angeles police during the 1932 campaign.

The radical leader has attended several World Congresses and executive meetings of the Comintern and of the Red International of Labor Unions. He recalls the inspiration of first seeing Lenin in Moscow in 1921—in Lenin's teachings Foster found the basis for his lifework. In March 1941 the Communist Party filled New York's Madison Square Garden in celebration of Foster's sixtieth birthday.

The course of Foster's changing political ideology took him from the conservative stand to the most extreme radical wing within the labor movement. Thus, it was between the First and Second World Wars that he was often the target of bitter attack from critics within labor officialdom. In 1919 a writer in *Current Opinion* saw Foster as a leader who appealed "to men of foreign birth who have little or no conception of American ideals and institutions." In 1924 an editorial in the *New Republic* criticized Foster and his followers in their T.U.E.L. activities, which appeared "merely to have created dissension and have antagonized indispensable sections of the rank and file." Another writer in the same magazine said eight years later: "He veered about to the tactics of starting new labor organizations whenever the chance to control existing unions from the inside was denied. This was described by Foster's labor enemies as a 'rule or ruin' policy."

In May 1944 Foster presided at the national convention of the American Communist Party when, under Browder's leadership, the party dissolved itself and was immediately reconstituted as a non-party organization, the Communist Political Association. (In mid-1945 it once more became a party.) Previously Foster had expressed his disagreement with Browder's political course, but his arguments against the latter's theoretical theses had been rejected by most of the Communist leadership. At the time of the dissolution of the C.P. an article in *Nation's Business* expressed fear of the "infiltrative practice" of the Communists, while, on the other hand, a study in the *American Political Science Review* (February 1945) saw little danger from Communists since their party had not engaged in revolutionary propaganda for eight years and had "abandoned the last slight

FOSTER, WILLIAM Z.—*Continued*

remnant of revolutionary ideology in January 1944." This situation, however, was drastically altered in 1945 with the publication in America of the article "On the Dissolution of the Communist Party of the United States" by Jacques Duclos. Reprinted from the April issue of the theoretical organ of the French Communist Party, it appeared in the *Daily Worker* in May with a foreword by Browder in which the C.P.A. president admitted that the article "reflects the general trend of opinion of European Marxists in relation to America." In a lengthy analysis of the wartime policy of American Communists, Duclos sharply criticized Browder's course. Reverberations were immediate: on June 2 the National Board of the C.P.A. passed a resolution redefining the Communist program, which the anti-Communist press called another Communist somersault. The resolution paid tribute to Foster's part in the formulation of Communist policy: "We must recognize important contributions which Comrade Foster made in the struggle against opportunism." Besides scoring the opportunistic tendencies of the wartime Communist policy, Foster condemned Browder's "revisionist ideas" and further contended that the policies based on these ideas "violated many basic principles of Marxism-Leninism."

The resolution, as amended and approved by the National Committee on June 20 (with the one dissenting vote cast by Browder), is entitled, "The Present Situation and the Next Tasks." Analyzing the fallacies of past Communist policy, it sought to right the errors by stricter adherence to Marxist-Leninist principles. Hence the Communist "line" steers away from all-out cooperation with capitalism towards sharper struggle against monopoly capital and clearer focus on the "class nature of bourgeois democracy." While the program remained substantially the same, supporting "every effort of the Truman Administration to carry forward the policies of the Roosevelt-labor-Democratic coalition," it pointedly emphasized that the people must "sharply criticize all hesitations to apply these policies, and vigorously oppose any concessions to the reactionaries; for the camp of reaction must not be appeased—it must be isolated and routed."

Aiming to re-establish their organization as the "independent, Marxist party of the working class," a special national convention was called to open in July (1945) in New York. At the end of the three-day gathering, to which members of the press and the public were forbidden admittance, announcement was made that Foster had been named to head the party (no longer the C.P.A.), while Browder and Robert Minor had been dropped from active roles. A new constitution was adopted, which, together with the naming of Foster as the party's leader, was seen as "a complete repudiation of the views of Browder," who had been the target of bitter intraparty criticism for a number of months. Although the terms of the new constitution were not made public immediately, the preamble, which was published in the *Daily Worker,* stated that the Communist Party was "the political party of the American working class, basing itself upon the principles of scientific Socialism, Marxism-Leninism." When announcement was made later, in October, that Louis F. Budenz, president and editor of the *Daily Worker,* had renounced communism to return to the Roman Catholic Church, Foster was quoted as saying it was "a most serious error" for the party to have promoted Budenz to responsible posts in past years. His statement that the promotions were "an example of political looseness and carelessness, which is related to the revisionism that characterized our party's policies in the more recent period" was seen as further criticism of Browder.

With the current reassertion of revolutionary principles, some observers see dangers in the altered Communist policy. This reaction was reflected in early June in an article by Eleanor Roosevelt['40], who observed that "certain actions of the American Communists in this country have added fuel to the general fear of communism as an international force." Along similar lines, a report submitted to the House Military Affairs Committee and unanimously accepted on June 29 stated that American Communists can now be expected "to plot such a revolution as they think will realize the Marx-Lenin dream." The New York *Times* carried Foster's denunciation of the report and his avowal that the Communists "remain steadfast to the objective of completing the destruction of fascism, and together with it Japanese militarism."

Late in the year, the war over, Foster was called before the House committee investigating un-American activities, and in his appearances at the hearings the committee drew forth his opinions on the Administration, strikes, the Soviet Union, United States imperialism. He accused President Truman['45] of leaning toward "aggressive imperialism," and said it was "a sorry day for world peace and world democracy" when James F. Byrnes['41] was appointed Secretary of State. Several weeks later, as conditions worsened in China's internal struggle between the Government and the Chinese Communists, Foster declared that the Administration would "precipitate civil war" in that country unless it removed American troops and withdrew its backing of Chiang Kai-shek's['40] "shaky regime." His warning was followed the next day in New York by a demonstration staged by the State committee of the Communist Party, at which Foster and a number of other speakers denounced "armed American intervention in China."

On another day in Washington a Syndicalist pamphlet written by the Communist leader in 1912 was introduced at the hearing, but Foster refused to answer questions pertaining to it, explaining that he had repudiated many years ago its revolutionary thesis. In references to the atomic bomb, he said that the retention of the secret of its manufacture was "the greatest political mistake" the United States had ever made, and he advocated turning it over to the United Nations Organization. Russia, the Latin American countries, and the new democratic countries of Europe, he declared, would not tolerate United States domination of the world. He denied that his Communist Party had any relation to that in the U.S.S.R., and that it received contributions from any groups outside the country. In regard to postwar reconstruction, he expressed the opinion that the United States should make loans to Russia and Great Britain, without dictating how the recipients should conduct their internal affairs. Strikes, he said on another day, were fomented by employers. (Before an audience of twelve thousand gathered in Madison Square Garden, New York City, in September in observance of the party's twenty-sixth anniversary, Foster "rededicated the party to a finish fight against capitalism," but said that "the limited economic program presented to Congress by President Truman must be adopted.")

A prolific pamphleteer, Foster has also written six books, *The Great Steel Strike and Its Lessons* (1920), *The Russian Revolution* (1921), *Misleaders of Labor* (1927), *Towards Soviet America* (1932), *From Bryan to Stalin* (1937), and *Pages From a Worker's Life* (1939). The last two are of an autobiographical nature and were well received by the critics. *From Bryan to Stalin*, according to the *Saturday Review of Literature*, is "a creditable piece of biographical writing, frank, clear, and complete." In reviewing *Pages From a Worker's Life*, Granville Hicks '42 wrote, "As a literary critic, I cannot help thinking how many proletarian novels might have come out of the experiences recorded in this book. Foster has seen so much, done so much, been so much. It is a modest book, characteristically impersonal, but you do feel the quality of the man." In one of his many pamphlets, *Your Questions Answered* (1939), Foster expressed the Communist views on political, economic, and social questions and declared, "We believe that a fundamental reorganization of society—socialism—is the only final solution of the workers' problems—unemployment, poverty, war."

Foster is described as "a tallish, thin Yankee with scanty hair, a slightly bulging forehead, a narrow chin, and mobile mouth." To a writer for *World Tomorrow* he looked like "a Presbyterian elder from the innermost hinterland," while he impressed *Current Opinion* as "a typical Western railroader." A mild-mannered man, Foster is, according to one source, "a hard fighter, whose zeal and self-sacrificial devotion to his cause cannot be questioned, but he is an incurable romantic." A seasoned orator, the Communist leader has a reputation for simple, forceful speech, with "little of the virtuosity of the politician or preacher who knows how to put over his personality." In a characterization of the American revolutionist, the writer George Soule wrote, "Ideas and movements are his food and drink, his work and play"

FRANKENSTEEN, RICHARD T(RUMAN) Mar. 6, 1907- Labor leader

Address: b. 411 W. Milwaukee, Detroit, Mich.; h. 18685 Roselawn St., Detroit, Mich.

"One of the ablest leaders in any union in any part of the United States" is the New York *Sun*'s description of Richard T. Frankensteen, whose unsuccessful campaign for election to the Detroit mayoralty in 1945 attracted nationwide attention. The UAW (CIO)—nobody ever calls it the United Automobile, Aircraft, and Agricultural Implement Workers of America—which he helped to found, has had as many as 1,236,580 members (in early 1944); but, although it is the world's largest union, its financial position is less secure than that of many others, for expenses tend to exceed the dues of a dollar a month. Officials stand for election each year, and "Big Dick" Frankensteen has weathered bitter factional fights since becoming one of the two vice-presidents in August 1942.

Richard Truman Frankensteen was born in Detroit on March 6, 1907, and was brought up in a Republican and Episcopalian household. His father, the late Harold L. Frankensteen, a singer, composer, and pianist, was soloist at Trinity Episcopal Church, and his mother, Grace (Smith) Frankensteen, still is. Dick and his brother Don, who is now a UAW official, sang in the Trinity choir. At thirteen, it is said, Dick weighed 185 pounds. Naturally, he played tackle on his high school football team, and he was selected as one of the All-State stars. During vacations the boy worked in the Chrysler automobile company's Dodge plant, beginning at the age of fifteen and continuing for six and one-half years. By the time he got to college, however (according to Joseph Driscoll of the New York *Herald Tribune*), Frankensteen is thought to have paid his way through the University of Dayton (Ohio) by playing professional football. While making an "enviable" scholastic record in the education course, he played tackle on the college football team and wrote and staged three musical plays. When Frankensteen was graduated in 1932, he was voted the most likely to succeed, and presented with a gold football and the Award of Honor as the best all-round man in his class.

The burly twenty-five-year-old was promised a job as teacher and athletic coach at the Noblesville (Indiana) High School, but the school board found itself bound by contract to keep the incumbent. Frankensteen had a wife to support—the former Grace Callahan of Dayton, to whom he had been married that April—and jobs were hard to get in those depression days. He therefore went back to the Dodge plant, working on the assembly line by day while he studied law at night at the University of Detroit. (He is a member of the Delta Theta Phi legal fraternity, as well as of Alpha Pi Chi.) During the three years Frankensteen worked in the Dodge trim department, he was elected employee representative and then presi-

RICHARD T. FRANKENSTEEN

dent of the bargaining council of the company union, and later became leader of the movement to reorganize it into an independent union. This was accomplished in 1935, and Frankensteen was elected president of the new Automotive Industrial Workers Association.

As president of this city-wide union, in 1935 Frankensteen led the first major organized industrial strike in the "open shop" city of Detroit. This was met with the violence characteristic of the period; in fights between union and anti-union forces tear gas, clubs, bricks, blackjacks, and similar weapons were used. From thousands of pickets, Frankensteen selected a few hundred as his "flying squadron" to meet the challenge; according to the UAW, this was the beginning of a standard practice. After his union amalgamated with the young United Auto Workers of America (CIO), Frankensteen was elected to the international executive board and assigned to direct organization in Detroit. When the thirty-year-old leader took over, the UAW had a few thousand members in Detroit plants; by the end of 1937, the membership was 250,000, and such companies as Midland Steel, Briggs, Packard, Murray, and Chevrolet, were forced to recognize the union as the workers' bargaining agent. During the widely publicized sit-down strike of April 1937, Frankensteen negotiated the first national contract with the Chrysler Corporation; the contracts he negotiated with Chrysler, then and later, were reported by his union as the best in the automobile industry, with the highest average wage rates.

In May of 1937 the union leader was halted and attacked by armed Ford company police when he attempted to hand out CIO leaflets in front of the River Rouge plant. This Battle of the Overpass, as it is known in UAW annals, was shown in newsreels, and a photograph of the battered and blood-spattered Frankensteen being comforted by fellow unionist Walter Reuther '41 was printed in newspapers in the United States and abroad. That was not the only occasion on which he met violence: he has also been teargassed in line of union duty, his home has been bombed, and he has had occasion to use his pistol to defend himself in the city of Flint.

But it was the Ford incident which, to quote *Newsweek*, "projected his name into the national limelight, where it stayed through a series of violent factional battles within the union itself." In that year, with the backing of president Homer Martin, Frankensteen was elected vice-president of the international union. At this time dissatisfaction among the members, most of them new to unionism, was brought on largely by the business recession which meant layoffs and lowered working hours. Payment of UAW dues dropped so sharply that the union took all its organizers off the payroll temporarily. In addition, the leadership was split into opposing factions. In 1939 Martin was replaced as president by R. J. Thomas '42, and "Big Dick" was also out of office. He was appointed organizational director for the Chrysler department, which had come to terms with the UAW a few years earlier. (In 1939, too, Frankensteen ran unsuccessfully for the Detroit Common Council, polling 150,000 votes.) Then, in February 1941, CIO President Philip Murray '40 appointed Frankensteen national director of aircraft organization, to bring the workers of the Nation's expanding aviation industry into the CIO. When jurisdiction over aircraft was given to the UAW in 1942, Frankensteen retained the post. Since 1941, under his directorship, upwards of 450,000 aircraft workers have become union members, and the UAW thinks that Frankensteen's success in two separate organizational drives—automobile and aircraft—must set some kind of record.

Frankensteen helped negotiate a settlement of the Vultee and Ryan '43 aircraft strikes in Southern California, but in June 1941 he was put in an awkward position by the unauthorized strike of one of his locals at North American Aviation. Weeks of wrangling over wage demands had led to negotiations under the National Defense Mediation Board, during which the UAW had promised not to strike. Frankensteen left Washington, but his plea to the strikers failed (he suspended the local officials and fired five representatives of the international union for failing to carry out UAW policies), and President Roosevelt '42 ordered the Army to take over the plant. At the same time Frankensteen declared the right of aircraft workers to "win for themselves and their families a standard of living which is consistent with . . . an industry whose profits range among the top three American industries, and yet whose average hourly wages, according to United States Government figures, rank tenth, or next to last, among the first eleven American industries classified as vital to defense." Another important plant where labor disputes involved Frankensteen that year was the Bendix plant of Air Associates, Inc.

After Pearl Harbor, Frankensteen was appointed, along with UAW vice-president Reuther and secretary-treasurer George F. Addes, to the ten-man Committee on Labor and Management, which in January 1942 was reorganized as a seven-man committee of the Office of Production Management, to help develop the best methods of converting the automobile industry to war production. He also became a labor member of the National War Labor Board, and in March served on the fact-finding panel which heard the arguments in the "Little Steel" wage case. In the UAW elections that August, Frankensteen and Reuther, with the backing of Thomas, were elected to the newly created posts of vice-presidents, at an annual salary of $7,000. (According to Scripps-Howard '40 writer Charles T. Lucey, UAW officials' salaries are modest, compared to those of other union executives.)

Addes and Frankensteen reportedly led the group on the UAW executive board which upheld President Roosevelt's wage-freezing executive order and supported a wage incentive plan for their industry in April 1943, but they were overwhelmingly defeated in this instance by the Reuther faction. They joined the other board members in signing a demand for slashing prices; "equal pay for equal work" throughout industry; eliminating the "Little Steel" formula in favor of wage adjustments to "match the increase in the cost of living"; and the guaranty of forty hours' minimum pay for every worker in essential war work when "material shortages, changes in production scheduling, or military design" prevented him from working a full forty hours. That May of 1943, after Chrysler's failure to live up to its UAW contract had brought on strikes of two locals, union president Thomas assigned Frankensteen to share Leo Lamotte's duties as director of the Chrysler department. That September Frankensteen declared that the Byrnes '41 Office of War Mobilization had failed to meet the aircraft production emergency, and proposed a labor-management-Government conference to work on production problems and on the elimination of "wastage of materials, machines, and manpower on planes of doubtful military efficiency, equalization of wages with those paid in shipyards, and the writing into Government contracts of provisions for labor-management production committees."

In January 1944 Frankensteen wrote to the newspapers in favor of a Federal absentee ballot for soldiers. In March he was one of the CIO representatives who went to Washington to dispute charges by Navy Secretary Knox '40 and Under-Secretary of War Patterson '41 that the manpower shortage in the bearing industry evidenced the need for a national service act. The union men contended that the real reasons were low wages, bad working conditions, and "selfish and monopolistic practices": management refusing to sublet contracts to possible future competitors, failing to use entire production capacity for fear of being caught short by the end of the war, and in some cases diverting bearings to civilian customers. Later that month Frankensteen announced the calling of a conference of UAW members honorably discharged from the armed forces, to decide whether to form a new veterans' organization or to join one of the existing groups; they could, he said, be important in counteracting unfair antilabor propaganda which was being spread among servicemen. In July 1944 the labor leader was chairman of the Michigan delegation to the Democratic National Convention, of which his chief Thomas was a member. Supporting the renomination of Vice-President Henry A. Wallace '40, the huge delegate impressed the crowd as he protested against the way Mayor Hague of Jersey City, boss Edward J. Flynn '40 of The Bronx, Mayor Kelly of Chicago, and Democratic National Chairman Hannegan '44 were directing the convention into choosing their candidate, Senator Harry Truman '45. Frankensteen's plea was unsuccessful but, says *Newsweek*, "he had stolen the show."

Later that month Frankensteen announced support of the Kilgore '43 bill for a central agency to handle cut-backs and reconversion to peacetime production, which would provide compensation, retraining and transportation costs of war workers moving to new jobs. He pointed out later that Congress had guaranteed industry against losses from reconversion, and declared that the Federal Government had "no more right to leave the eighteen million war workers unprotected during reconversion than it had to leave the marines stranded on Guadalcanal." In August, after a two-hour plea to strikers at the Wright Aeronautical Corporation in New Jersey, he brought their four-day wildcat strike to an end. At about this time his union petitioned the Federal Communications Commission to revoke the license of Station WHKC (Columbus, Ohio). The charges were that the station had unfairly censored and discriminated against the union by forcing Frankensteen and others on broadcasts for which time was paid for to rewrite speeches dealing with "controversial issues," yet permitting free expression to the political talks of Colonel Robert R. McCormick '42 and the anti-union and anti-Administration commentaries of Boake Carter '42 and Fulton Lewis, Jr. '42. The station's reply to the latter charge was that Carter and Lewis were network commentators and that an individual station could not control their utterances, while it could and should blue-pencil "controversial" discussion originating at its station. The station president also declared that the items eliminated from the union broadcasts "were not friendly or constructive, which was contrary to the contract between the union and the station." In October 1944, when Frankensteen was invited to address the National Association of Broadcasters' code compliance committee, he "pulled no punches" when he said that radio had completely ignored its legal obligation to permit unbiased presentation of controversial issues, and, in the case of labor relations, had flagrantly and conspicuously favored the employers.

In May 1944 Frankensteen denounced the Navy's sudden termination of contracts with the Brewster Aernautical Corporation's Long Island and Johnsville plants without notice to the workers, as showing "a lack of concern on the part of Congress and certain Departments with effective war mobilization, and a complete disregard of labor's right to employment." As reported in the New York press, two days before the July termination, in an unprecedented move, 13,500 workers, of whom 7,600 had been dismissed, stayed in the plants to complete construction of remaining Corsair planes. They said they would continue without pay and thus give the company time to get other war contracts. (Frankensteen had made the offer to the corporation president.) This was done with the unofficial but cordial cooperation of the management, the workers camping in the plant without disorder, and in Johnsville the working

FRANKENSTEEN, RICHARD T.—*Cont.*

shift established a new record by doubling the average daily production of assembled airplanes. After a day's conference in Washington, Frankensteen called off the demonstration, as it had achieved his purpose of dramatizing the problems of abrupt contract termination and bringing about the President's intervention. The War Production Board made Brewster the first item on the agenda of a new Joint Contract Termination Board. The whole situation, Frankensteen declared, arose from the handling of manpower on "a fire-brigade basis: do nothing until you have a five-alarm fire; each emergency by itself"; and he called the termination at Brewster "the Pearl Harbor of labor."

Director of the UAW'S Political Action and Legislative Activities, Frankensteen was also one of the busiest PAC speakers in the national election campaign that year, traveling from coast to coast for the purpose. As the union political director, Frankensteen maintains a "very active" Washington office, "cooperating with Congress to bring the 'grass-roots' labor point of view to them on all current legislation," and keeping UAW members informed of the voting records of their Congressional representatives.

In March 1945 Frankensteen was involved in the ten-day series of Detroit strikes affecting six armament plants of the Chrysler Corporation and the Briggs Manufacturing Company. He and other UAW officials were booed by strikers whom they urged to return to work. Frankensteen said that a change in WLB policy was urgently needed to "avert collapse of Detroit area war production," and that prompt WLB action would prevent 90 per cent of work stoppages. In a prepared statement he charged Chrysler officials with provoking strikes in the hope of discrediting labor, the WLB, and the whole principle of collective bargaining. Not long afterward the Senate War Investigating Committee (the Mead '44 Committee) found low morale and questionable practices at the Packard plant in that area; and evidence given at its hearings revealed tension, suspicion, and alleged grievances on both sides throughout the area, which were causing a day-to-day loss in war production estimated at 25 per cent of capacity. In June Frankensteen again told strikers that they had "been misled into mobocracy, not guided by union principles of democracy," and that their waves of strikes was "bad and dangerous business in peace—in time of war it is tragic folly."

At this time he was a candidate for the nomination for mayor of Detroit, as the first prominent CIO official to run for public office. In addition to this campaign and to his executive problems of labor relations and finding jobs for displaced aircraft workers, Frankensteen campaigned for his re-election as UAW vice-president—never a sinecure—and was trying to raise the money to produce his operetta *Gypsy Moon*, on the music of which his late father had collaborated. (According to one report, CIO officials who saw a church production of the operetta in March contributed $60,000 of the necessary backing.) With the end of Frankensteen's aircraft duties he was free to devote his time to the campaign, during which he made ten to fifteen speeches a day.

The CIO executive board refused to allocate any funds for Frankensteen's campaign, but he had the support of the Political Action Committee and was president of Labor's Non-Partisan League of Wayne County. At the municipal primary in August Frankensteen ran first of the seven candidates, leading the incumbent Mayor Jeffries by 14,182 of the total 201,000 votes cast. (Detroit elections are on a non-party basis. The two highest candidates in the primary oppose each other at the general election.) Frankensteen declared that if he were elected he would resign from the UAW-CIO and "not only be mayor for all labor, but also for all Detroit," but the chief issue remained "labor in politics." The campaign was expensive and more than usually bitter, with Gerald L. K. Smith's '43 America Firsters among Jeffries' supporters, and Frankensteen finding it necessary to disavow the Communists. Frankensteen's cause was complicated, not only by A.F. of L. opposition to him as a CIO man, but by the unfavorable impression created by the UAW's demand for a 30 per cent wage increase from General Motors, although he had not been present at the executive session which made that decision. Out of an unprecedentedly high total of 492,000 votes, Frankensteen received about 44 per cent, losing to Jeffries by 57,000.

"A giant of a man," curly-haired Richard Frankensteen is very heavily built and is six feet tall. He has black hair, hazel eyes, is described as "a mild fellow who collects dolls for a hobby," and an ambitious amateur composer who sings baritone. There are three children in the family—Carol Lee, Marilyn Lee, and Richard, Jr. In public life, Frankensteen is "the glamour boy of the UAW—affable, engaging, charming, articulate. He has an invaluable radio voice, and he can turn in a rousing speech from any public platform." His committee memberships include the CIO's National Welfare Committee and the selection committee of UAW's nonprofit Labor Book Club (organized in early 1945), and he was appointed to Michigan's Emergency Relief Committee by Governor Murphy. Frankensteen is a member of the Pyramid Club, and a board member of the Michigan Red Cross. He was appointed by Roosevelt to both the WPB and the WLB, and perhaps his proudest possessions are letters on White House stationery, and a photograph inscribed "For Richard T. Frankensteen, from his friend Franklin D. Roosevelt."

FRICK, FORD C(HRISTOPHER) Dec. 19, 1894- Baseball executive; journalist

Address: b. National League of Professional Baseball Clubs, 30 Rockefeller Plaza, New York City; h. 16 Edgewood Lane, Bronxville, N.Y.

As president of the National League of Professional Baseball Clubs, Ford C. Frick shares with his opposite number, Will Harridge of the American League, the second highest position in America's national sport, which is also a big business. (The highest position is that of Commissioner Albert "Happy" Chandler '43.) Elected in 1934 and re-elected ever since by the owners of the eight National League baseball teams, Frick presides over the destinies of the Boston Braves, Brooklyn Dodgers, Chicago Cubs, Cincinnati Reds, New York Giants, Philadelphia Phillies, Pittsburgh Pirates, and St. Louis Cardinals.

Ford Christopher Frick was born December 19, 1894, on a farm near the small town of Wawaka in northeast Indiana. His parents, Jacob and Emma (Prickett) Frick, moved to Brimfield when Ford was five, and there he attended the grade schools. "My ambition was to be a major league first baseman," Frick recalls, "and my idol was Cap Anson, Chicago's great initial sacker. I read everything printed about him—and about all the other famous first basemen of the day—in the newspapers and magazines." With this high resolve, Ford tried hard to follow the same training methods.

After graduating in 1910 from the Consolidated High School in near-by Rome City, sixteen-year-old Ford got a job on the Fort Wayne, Indiana, *Gazette*. In 1911 he entered DePauw University, where he was on the baseball and track teams, was elected to Sigma Delta Chi and Phi Kappa Psi, and made some money as a correspondent for Indianapolis, Terre Haute, and Chicago newspapers. (Frick keeps in touch with college associates: he's an active alumnus, for a time he was president of the Alumni Association, and he is now president of the Alumni Fund Council and a trustee of the university.)

Upon his graduation in 1915, the new B.A. took his first step toward the major leagues: he was signed as first baseman of the Walsenburg, Colorado, semi-professional baseball team. A summer with them led to a position teaching English in the Walsenburg high school; and this, in turn, led to an assistant professorship of English at Colorado College that same year. In September 1916 the twenty-two-year-old professor was married to a local girl, Eleanor Cowing. (They have one son, Frederick Cowing Frick.) The next year, 1917, Frick's part-time work for the Colorado Springs *Telegraph* blossomed into a full-time job as reporter, which he left in 1918 to go into war work.

FORD C. FRICK

During the First World War, Frick worked for the War Department's rehabilitation division, supervising the training of rehabilitation workers in Colorado, Utah, New Mexico, and Wyoming. At the end of the war Ford Frick joined the staff of the *Rocky Mountain News* at Denver as a sports reporter; but later in 1919 he returned to Colorado Springs to form an advertising agency, and soon found himself writing a column for the *Telegraph*'s editorial page. The *Telegraph*'s printer liked Frick's column so much that he spoke of it to Arthur Brisbane, editor of the New York *Evening Journal*. Brisbane called the columnist to New York for an interview, which led to a position on the New York *American* staff in 1922.

A year later Frick moved to the *Journal*, where for eleven years he wrote a sports-page column of the Grantland Rice '41 school, sometimes putting his news and comments into verse form. Assigned to cover the fabulous New York Yankees baseball team, he "packed his portable [typewriter] around the circuit" as they toured the country each year. Besides writing daily articles under his own by-line, he "ghosted" those to which Babe Ruth '44 and manager Miller Huggins signed their names. The 1927 World Series between the Yankees and the National League Pittsburgh Pirates was particularly hectic for him, Frick recalls: "Hug and Babe were regular assignments, but they tossed in Lou Gehrig '40 in that Series for good measure." In May 1930 the *Journal*'s news editor missed his regular news broadcast because of illness, so Ford Frick was called on to substitute for him. Frick made such a good impression that he was immediately signed for a twice-daily sports broadcast, which he continued for four years, in addition to his newspaper work. In February 1934 Frick entered upon the duties of manager of the Service Bureau of the National League of Professional Base Ball Clubs—publicity director of the league, at a salary of ten thousand dollars. ("Base Ball" is now written as one word.) He resigned his newspaper posts, but finished out his broadcasting contracts, which expired that December.

Less than ten months after taking over the league's publicity, Ford Frick was unanimously elected to its presidency, on the retirement of John Arnold Heydler, who became chairman of the board. Frick, who had just one month to go before his fortieth birthday, was the young-

FRICK, FORD C.—*Continued*

est National League president and the second youngest in either league (the first being Bancroft Johnson, who in 1901 became president of the American League at thirty-six). President-elect Frick insisted that "but for the fact that Harvey [Traband, Heydler's secretary] absolutely refused this job, I don't think I would even have been considered."

In December 1934 Frick finished his radio chores and took over the league presidency. He was immediately confronted with a number of personality problems, centering in the World Series-winning "Gashouse Gang" of St. Louis Cardinals, which included such unrestrained enthusiasts as "Lippy" Leo Durocher '40, Dizzy Dean, Pepper Martin, Rip Collins, Joe (Ducky Wucky) Medwick, Bill (Kayo) DeLancey, and the umpire-baiting manager Frankie Frisch. Umpires are in the province of the league, which hunts for umpire talent as the clubs scout player talent; umpire trouble therefore had a way of making for Frick's office. Dizzy Dean was an extra problem, and some of Frick's former associates of the Baseball Writers Association "badgered him a lot" about letting the eccentric pitcher "walk all over him." Perhaps because a prophet is without honor among his colleagues, they "accused him of turning Rotarian and said the club owners were just using him as a 'front' man while continuing to conduct the league's business themselves." (At any rate, the owners reelected him at appropriate intervals and raised his annual salary from a reported twenty thousand dollars to an alleged thirty thousand.)

"During these early years," writes Al Laney in the New York *Herald Tribune*, "it is true that Frick was not impressive as a big executive. He seemed always to be sitting on the fence. But it now appears [after ten years] that he was feeling his way, gaining strength as he went along. After a while . . . he took charge, and he still is in charge. Now, if you look back over the years, you can see what Frick has meant to the National League and to baseball. The condition of the National League today testifies to that. It is a very strong organization, and Frick is entitled to most of the credit." When Frick took over, three of the eight National League clubs were on shaky financial ground: the Brooklyn Dodgers, the Boston Braves, and the Philadelphia Phillies. Observers credit Frick with putting them all back on their feet. To quote Laney again, "Frick cleaned it [the muddled Boston club] up and committed the league to putting up money to keep the club afloat until it could go under its own power. There also was the Brooklyn situation which, to put it mildly, had been a mess ever since Wilbert Robinson died." The club's debts amounted to $1,200,000, and the owners were split into two equal and opposed groups in 1938, when the Brooklyn Trust Company took over the club; it is said that Frick persuaded them to call in Larry MacPhail '45, who had built up the Cincinnati Reds to a winning team and who did even better for the Dodgers. As for the perennially last-place Phillies, they stayed at the bottom of the league but were brought up to a sound financial footing through the development and sale of players to more ambitious clubs.

One of the first problems confronting Frick was night baseball, which had been started by minor league clubs, and taken up by MacPhail in the early 'thirties. This change would make possible the attendance of thousands of persons who were at work during the afternoons; but many baseball men opposed the innovation, claiming that the reduced visibility by artificial light put an extra strain on the players. During 1935, therefore, Frick and his associates "examined the playing records of various minor leagues covering the performances of the last three years and found that the average ballplayer hit .004 worse and fielded .007 better under the stars than he did under the sun." The league therefore allowed evening games, which were, however, tentatively introduced into the schedule.

At the close of the 1935 season Frick directed another survey, this time of New Yorkers, "with a view to getting a representative cross section of metropolitan fandom's sentiments, desires, phobias, and ideas" on baseball, with particular reference to those of women. Other administrative problems concerned the total number of players to be allowed on one club's roster at any given time. During Frick's tenure this has risen from twenty-three to twenty-five and then to thirty. The first increase was made for purposes of efficiency, the second in order to provide jobs for men returning to baseball from the services. As of 1945, the permitted totals were forty-eight players per club in the off-season, thirty during the playing season, and twenty minor league players on option. A Frick innovation in 1935 was the issuance of lifetime passes to major league veterans, which was adopted by the American League a year later. Another Frick plan, in 1936, was reported by the *Literary Digest*: "To heighten National League competition and spectator interest this year, President Frick announced that rival baseball players 'fraternizing' on the field would be fined ten dollars." However, when Dick Bartell (Giants) and Van Mungo (Dodgers) fist-fought at Polo Grounds, he fined each twenty-five dollars and "served notice that the nonfraternizing restriction carries no license for free-for-alls."

Ford Frick was considered the moving spirit behind the celebration of baseball's hundredth anniversary in 1939, although the late Baseball Commissioner Kenesaw Mountain Landis '44 became chairman of the Centennial Committee. One of the founders of the ninety-thousand-dollar National Baseball Museum at Cooperstown, New York, which was opened in July 1938 and dedicated in 1939, Frick contributed several cherished National League mementos. These included the Temple Cup, a large silver bowl which the league had presented to the New York Giants for winning the national championship in 1888 and 1889, before the World Series was established as such. He even persuaded Johnny Vander Meer to part with the plaque he received for pitching two successive no-hit games in the 1938 season. That year, too, the National League produced a motion picture, *The National Game*, tracing baseball's hundred-year history.

After the United States entered the war in late 1941 Frick contributed his services to the war effort. He managed the Baseball Equipment Fund, supervised the distribution of playing equipment to the armed forces, and helped to organize the Camp Shows program. All National League players were advised to take war jobs during the off-season. This backfired on occasion, when players who took essential work found themselves "frozen" in their jobs and unable to return to the nonessential business of baseball. Commissioner Landis ruled that baseball not only would refrain from asking special consideration but would "stay out of Washington" altogether. After the Judge's death in November 1944, however, Frick and Clark Griffith, president of the American League Washington Senators, went to the Capital and conferred with draft, manpower, and transportation officials to ascertain the prospects for their baseball clubs. In early 1945 War Manpower Commissioner Paul V. McNutt '40 ruled that men might leave war work for baseball during the season, when baseball was their "primary occupation."

To carry on the duties of the baseball commissionership, the club owners elected the triumvirate of Frick, American League president Will Harridge, and Landis' secretary-treasurer, Leslie O'Connor. The name of practically every United States executive who had or was thought to have or might be persuaded to take an interest in baseball was mentioned for the commissionership—including former Postmaster General James A. Farley '44, War Mobilization Director James F. Byrnes '41, dozens of assorted jurists, Generals Eisenhower '42, MacArthur '41, and Somervell '42, and even some baseball men. Ford Frick's candidacy had the reported backing of nine of the sixteen major league club owners; and in December 1944, re-elected president of the National League for four years, Frick sat in with the committee of club owners which drew up the new major league agreement defining the commissionership.

Commentators saw in Frick (the words are Joe Williams') a man who "has had a sufficiency of administrative experience to handle the job. The days when he'd let a Dizzy Dean run all over him in his office are far behind him. He knows how to get tough now; he is levelheaded, aggressive, and sensitive to the promotional needs of the sport. As a commissioner he'd do all right." Those who preferred a commissioner from outside the ranks of baseball had their way, however, and the commissionership finally went to Senator Happy Chandler of Kentucky.

Immediately after the news of Japan's surrender an unprecedented two-day meeting of baseball's postwar committee was held in Washington. Frick was appointed to a subcommittee to work out promotional plans; and on August 19 he announced that returning war veterans and younger players would get special attention by baseball in its peacetime expansion program. He further stated that baseball's postwar planning would be put into operation immediately, while new circuits and old reinstated organizations in the minor leagues would swell their activity threefold in 1946.

Ford Frick is, according to John Kieran '41, "a tall, dark gentlemen from Indiana with a clear head, a bright smile, a brisk Midwestern voice, and a large supply of energy always working in the right direction." An Episcopalian, he describes himself as "fifty-fifty" politically—half a Republican and half a Democrat. He and his wife live in the New York suburb of Bronxville, where he is a director of the Westchester County Children's Association. When the United States entered the war in 1941 the Fricks' son Frederick was in England doing postgraduate work at Cambridge; he went into psychological warfare work overseas, returning to the United States two years later, and entered the Army in 1943.

The senior Frick is a member of the Baseball Advisory Council, the National Journalistic Fraternity, the Advertising Club of America, the American Legion, and, since the late 'thirties, has served on the advisory committee of the National Dental Hygiene Association. Fond of golf, he belongs to three country clubs. The league president "likes to dunk rolls in coffee and doesn't care who knows it." Frick's enforced neutrality in the National League pennant race forces him to confine his rooting to the inter-league World Series and All-Star games, but has not affected his love for baseball: "I still feel like reaching for a glove and getting out there at shortstop when the sun sets the grass agleam and I hear a dozen and a half excited voices choosing up sides for the day's battle."

Who's Who in America, 1944-45

FRYE, JACK Mar. 18, 1904- Air line executive

Address: b. Transcontinental and Western Air, Inc., Airlines Terminal Bldg., New York City; 101 W. 11th St., Kansas City, Mo.; h. Sedona, Ariz.

TWA, American, United, and Eastern are the "Big Four" of the nineteen American air lines that are already competing in the international struggle for postwar air leadership. Heading TWA (Transcontinental and Western Air, Inc.) is "big, burly, go-getting" Jack Frye, the youngest president of a major air-transport line in America and the only airline president to hold a transport pilot's license, having over six thousand flying hours in his own log. Active in aviation since the age of nineteen, Frye has been a pioneer in designing planes and establishing air lines, and believes that commercial aviation will be a primary factor in uniting the nations of the world in the future.

The son of William Henry Frye, Jack Frye was born March 18, 1904, in Sweetwater, Oklahoma. After his mother's death when he was eight years old, Jack spent much of his youth with his father and grandparents on the fifteen-thousand-acre family ranch near Wheeler, Texas. Texas has always seemed like home to him, and he is often referred to as a Texan. It might be said that Jack began his aviation career at the age of fourteen, when he ran errands for several stranded airmen who were forced down near his home. Jack almost immediately developed pneumonia and was ill for ten weeks, but his first vision of the romance of flying probably came to him at this time. After that his life pattern fol-

Transcontinental & Western Air, Inc.
JACK FRYE

lowed the popular American "success" tradition—he became known as a man with "a habit of making dreams come true."

Jack went to public school, leaving high school before graduation to spend a year in the Army Engineering Corps. In 1923 he went to California, where he worked as a soda clerk in Los Angeles. One day a friend drove young Frye past an airfield where a barnstorming pilot was taking passengers on fifteen-minute hops. The flier took Jack for a ride, with the result that the nineteen-year-old boy began taking flying lessons at twenty dollars an hour, paying for this first investment in the future with savings from his soda fountain earnings. After seven hours of instruction Jack was allowed to solo, and soon after that he took a passenger up with him. The passenger, incidentally, was not aware of the inexperience of his pilot.

His aeronautical novitiate completed, young Frye, together with his flying instructor, bought a battered old war-veteran plane, a Curtiss Jenny, put it in working order, and with it formed the nucleus of a flying school and aerial taxi service known as the Burdett Flying School. By 1926 Frye had become president of the Aero Corporation of California, which also operated a flying school as well as a service and maintenance base and an aircraft sales agency. (He was president of Aero until 1930.) In November 1927 the company launched a regular service between Los Angeles and Tucson, Arizona; a year later the route was extended to El Paso, Texas, with Fokker single-engine planes; in 1929 it was using Fokker three-engine F-10's.

Jane and Woodrow Wirsig, writing in *This Week*, tell a typical Frye story in connection with his next venture, the formation of the Standard Air-Lines for service between Phoenix and Los Angeles: It was a hot night in Phoenix in 1927. Bored and restless reporters were sitting around in the city room of the local newspaper when in strode a tall, gangling stranger wearing grease-covered work clothes, with goggles pushed up under his flier's helmet. "My name's Jack Frye," he announced. "I'm going to start an air line here and I'd like to tell somebody about it." Frye and his partners, Paul E. Richter and Walter H. Hamilton, who had been his flying students, had established a one-plane subsidiary to the Aero Corporation to operate a scheduled air-transport service between Phoenix and Los Angeles. This subsidiary they named the Standard Air Lines.

Frye was president of Standard Air Lines until it merged with Western Air Express in 1930, when he became vice-president in charge of operations in the new company. This post he continued to hold when later that same year Western merged with Transcontinental Air Transport-Maddux, to become Transcontinental and Western Air, Inc. (One writer has compared Frye's merging of air companies with his youthful "ambidextrous merging of raspberry flips.") TWA immediately inaugurated the first coast-to-coast service to carry passengers entirely by air—thirty-six hours, with an over-night stop at Kansas City. In 1931 it acquired Northrop mail planes and took the lead in mail flying, while continuing passenger service in Fords and Fokkers. That same year TWA drew up specifications for a faster, larger, and more comfortable plane, which Donald Douglas '41, then a maker of military aircraft, built for the company and called the DC-1—the first Douglas plane designed exclusively for the commercial field. From this was developed the fourteen-passenger DC-2, which TWA was the first to fly. By the spring of 1934 it had thirty-one DC-2's in service and had reduced the cross-country flying time from twenty-four hours, which TWA had maintained since 1932 with DC-1's, to sixteen.

Jack Frye took over his present duties as president and director of TWA in 1934. (Walter Hamilton became a Douglas Aircraft executive, and Paul Richter an executive vice-president of TWA.) That same year all air-mail contracts with commercial lines were canceled by the Government and in February the Army Air Corps started flying the domestic mail. Later that same year, in June, following the deaths of ten Army mail pilots, the Government re-offered the contracts to the commercial lines on a bid basis. Frye had set a cross-country transport plane record in a DC-1 when he himself flew the last load of air mail under the old contract from Los Angeles to New York in thirteen hours and two minutes; then set another record under the new TWA-Government contract when he carried the first mail load in eleven hours and thirty-one minutes in a Northrop Gamma plane. In 1936 Frye made still another record when he flew from Chicago to Washington in two hours and twenty-two minutes. A "record" of a different sort was perhaps President Roosevelt's '42 use of TWA planes to cross the Atlantic on several history-making conferences of the Second World War. And in December 1945 a TWA Lockheed Constellation set a new commercial record of twelve hours and fifty-seven minutes from Washington to Paris.

In 1935 TWA began experiments in high-altitude flying in order to overcome one of the major dangers in scheduled flights. Frye has pointed out that pilots had trouble in clearing cloud formations which might be obscuring mountain peaks, and had difficulty in breathing above twelve thousand feet. TWA used the DC-1 for many high-altitude test flights, then in 1936 equipped a single-engine Northrop Gamma mail plane with a turbo-supercharger lent by the Army. On several occasions it was found that the Gamma, because of its higher ceiling flying level, could fly in safety in weather which necessitated the cancellation of regular lower flying transport service. By 1940 TWA had a fleet of thirty-three-passenger, four-engine Boeing Stratoliners, built to cruise at high altitudes. These were equipped with "pressurized" cabins in which atmospheric pressure was controlled so that passengers could enjoy low-altitude comfort while flying as high as twenty-two thousand feet. For eighteen months TWA operated five Stratoliners in domestic service; in the winter of 1941-42 Frye turned them over to the Army for use in the foreign courier service. But their use in commercial air service had been long enough to prove that high-altitude flying was acceptable to the traveling public.

In an article published in the *Commercial and Financial Chronicle* in January 1941, Frye listed the domestic transport service provided by the luxurious Stratoliners among the highlights of the year 1940, during which the air-transport industry "undertook one of the most rapid expansion programs ever to be carried out in one year." Other important projects of the year were the handling of capacity traffic at La Guardia Field, the opening of Philadelphia's new multi-million-dollar airport, the opening of Pan American Airways' new route across the South Pacific, and the completion in midtown New York of the world's first airline terminal building. TWA nearly doubled its personnel and office facilities that year, Frye pointed out. In addition to the introduction of five Stratoliners at a cost of two million dollars, (on which, according to *Newsweek*, they lost money), TWA placed orders for new twin-engine Douglas planes and a number of Wright engines. Applications for several new routes were filed with the Civil Aeronautics Board to provide new service into cities and regions without mail, passenger, and express air schedules.

In 1941 Frye with Howard Hughes '41, "the fabulous flier, movie producer, industrialist," began work on plans for the Lockheed Constellation, today considered TWA's most spectacular achievement. A triple-rudder transport, the Constellation, or "Connie," is said to be faster than a Japanese Zero, with a carrying capacity of from seventy-five to a hundred armed soldiers, or fifty-seven passengers and a crew. It has pressurized cabins, can fly at a ceiling of over thirty thousand feet, cruise for four thousand miles at more than three hundred miles an hour, and it has a wing spread three feet broader than the entire distance covered in the entire first flight of Orville Wright at Kitty Hawk in 1903. In discussing the Constellation, Jack Frye has pointed out that it has a range of flight and speed that would bring any capital in the Western Hemisphere within sixteen and a half hours of the United States. Sydney, Australia, could be brought within forty flying hours of Dayton, Ohio, for example, as against twenty-three days by rail and steamer. In April 1944 a Constellation made a spectacular record when it was flown by Jack Frye and Howard Hughes from Burbank, California, to Washington, D.C., (2,663 miles) in six hours and fifty-eight minutes at an average speed of 355 miles an hour. Constellations, the largest land-based transports in full production in 1945 were, at the end of that year, in Government service, flying personnel and supplies out from fighting fronts and bringing wounded and about-to-be-discharged men home.

The question of international air routes is a controversial issue in 1945; tied up with it is the matter of postwar Atlantic fares, which *Time* Magazine calls "the battle of plane fares." Pan American Airways and American Export Airlines have had the only transatlantic air carriers operating in the Second World War. Pan American has taken the position that in order to meet foreign competition the United States must have only one air line operating internationally; Frye has consistently maintained that the United States was "large and powerful enough in relation to other countries to support a relatively greater number of international air lines." In April Frye told a Senate subcommittee that his company would have no part in a proposed cooperative international air line, feeling that a single monopoly for all United States international air transportation would lead only to Government ownership or failure. He thinks also that American competition would produce better service for the traveler.

In 1943 and 1944 TWA had applied to the Civil Aeronautics Board for commercial routes to the Azores and to Calcutta via London, Paris, and Cairo. By the end of 1944 there were more than a dozen air lines applying for transatlantic routes, but it was not until July 1945 that CAB authorized Pan American Airways, American Airlines (through its subsidiary the American Export Airlines), and TWA to fly to Europe. (Pan American is the only air line which had previously had permanent authorization for the North Atlantic service or for landing rights in the Azores, though TWA like many other domestic lines had been flying foreign routes for the Army.) The new CAB authorizations, limited to seven years to permit review by the Board, cover general routes instead of the usual point to point pattern, thus in effect giving permission to serve the general area through which the route passes.

Pan American strongly protested the new ruling, claiming "gross favoritism" to TWA and American. Frye in his counterargument claimed that he was in a better posiiton than anyone else to begin transatlantic service; that TWA had "operated more flights across the Atlantic than Pan American or any other carrier"; that the "only modern, high-speed, four-engine equipment that Pan American can get in the near future is the Constellation, which TWA developed and on which TWA has prior delivery rights. [TWA had in operation, in October 1945, five Boeing Stratoliners returned by the Army.] This leadership is the product of competition which Pan American seeks to extinguish. It explains that operator's con-

FRYE, JACK—*Continued*

stant effort for two years now to prevent the establishment of any United States foreign air route by anyone but Pan American." And the rate war was on. Frye announced a one-way fare from New York to London of $263.80, and the next day Pan American announced that it expected to drop its one-way fare to about a hundred and fifty dollars as soon as its new 128-passenger planes were available. At about the same time spectacular reductions in flying time schedules—ten-hour service from coast to coast and eleven-hour service between New York and London—were announced by the four major air lines, to take effect probably by January 1946.

A story illustrates Frye's plans for aviation: During the early days of his presidency of TWA he once was sitting at a directors' meeting when the bankers asked why the company was not paying dividends. "I'll tell you why," said Frye earnestly. "No airplane today is good enough. No air line flies often enough, or fast enough. Air lines shouldn't pay dividends for ten years—not until they reach the point where they can really serve the public." Today Frye thinks that vast merchant air fleets capable of transporting most of the world's cargo will emerge from the Second World War and may be the key to lasting peace. Aviation, which was a struggling young industry in 1932, has now a real record of achievement. The air line president thinks that the transport plane of tomorrow will be much larger than anything yet built, capable, perhaps, of carrying as much as two thousand tons vast distances on nonstop flights. American youth should be given a sound education in aviation, he thinks, to be prepared to carry on the enormous expansion in air routes that may be expected in the future. Before the end of 1946 Frye expects to triple the TWA fleet, and his goal is to make aviation both the fastest and the safest means of travel—but this he thinks will take another fifteen years.

Jack Frye is director of the Air Transport Association of America and a member of the advisory committee of the Institute of Aeronautical Sciences, the National Aeronautical Association, and the Air Lines Committee of United States Air Policy. He is a member of a number of clubs in cities not so far apart from an aviation expert's point of view: in San Francisco, Los Angeles, Kansas City, Chicago, New York, and Washington. In the Second World War he holds a commission as lieutenant commander in the United States Naval Reserve.

The air-line official is described as a dynamic person who knows his business "from swivel chair to cockpit." Over six feet tall, weighing close to two hundred pounds, he has brown eyes and dark brown hair peppered with gray. He is said to be meticulous about his clothes, liking red ties, tweeds, and dark worsteds "as snappy-looking as his planes." In 1941 he was married to Helen Warner Vanderbilt, who had formerly been married to Cornelius Vanderbilt, Jr. Mrs. Frye has told newspapermen that her interest in TWA advertising was partly responsible for their romance: she had told Frye that air-line advertising should portray the adventure of flying instead of emphasizing comfort and speed. Mr. and Mrs. Frye spend as much time as possible on their ranch near Flagstaff, Arizona. Frye has written numerous newspaper and magazine articles on aviation and has other literary interests. His home library contains "practically everything from eighteenth century poetry to Saint Exupéry '40."

FUNK, CASIMIR (fo͞ongk kăz'ĭ-mĭr) Feb. 23, 1884- Biochemist

Address: h. 186 Riverside Dr., New York City

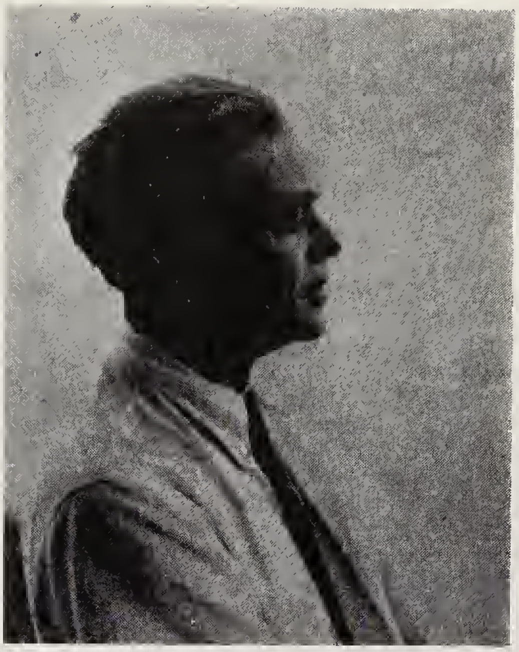
One of the world's most eminent biochemists, Casimir Funk is credited with the discovery of vitamins. Although he was born in Poland, he has been identified with important scientific institutions elsewhere in Europe, and in the States, of which he became a citizen in 1920. He has contributed his studies to various aspects of biochemistry and medicine, and has worked in the field of microchemistry. In addition to his contribution to the knowledge of nutrition, Funk has done important work with the hormones. He was the first to make adrenaline, one of the first to make salvarsan in the United States, and his was the first commercial vitamin concentrate accepted by the American Medical Association. Funk recalls with a smile that, while the A.M.A. once turned down his concentrate of Vitamin B-1 as unwanted, the American public spent a quarter of a billion dollars on vitamin capsules in 1943.

Born in Warsaw, Poland, on February 23, 1884, Casimir Funk is the son of Dr. Jacques Funk, a well known dermatologist, and the former Gustawa Zysan. Interested in biology from his early youth, Casimir nevertheless wanted to obtain a degree in medicine before going on with his chosen work. His father, who was influenced by the sensationally rapid advance that was being made in chemistry at that time, persuaded him to confine his efforts to biochemistry. Accordingly, at sixteen young Funk was sent to Berne University to study organic chemistry under Kostanecki, an authority on plant pigments. His thesis for his Ph.D. (Berne, 1904) on the derivatives of stilbene was a forerunner of important pioneer work that he and others were to do some twenty years later in the hormones. (A closely allied stilbene compound is now in use as a substitute for the female hormone.)

Following his graduation Funk spent two years in research at the Pasteur Institute in Paris, where Gabriel Bertrand was the biochemist and Elie Metchnikoff was doing his brilliant work in immunity and intestinal flora. Funk's work there made him collaborator of Emil Fischer and later assistant to Emil Abdehalden at the University of Berlin (1906-7, 1908-10). Under the guidance of Abdehalden, who like Fischer was considered a "master of protein chemistry," Funk received his foundation for the work he was to do in vitamins. During his stay in Germany he spent one year as a biochemist at the Wiesbaden Municipal Hospital (1907). In 1910, given the promise that he could carry on independent work, the young biochemist went to London to join the Lister Institute of Preventive Medicine. There he unexpectedly found his great opportunity. The director of the Institute, Charles Martin, wished research done on the causative factor of beriberi, which was highly prevalent in the Far East and which he believed was the result of inadequate protein in the natives' unvaried diet of polished rice.

The history of the discovery of the vitamin is like that of almost every scientific discovery. An army of other workers had done research in the field before Casimir Funk made public his findings. Each had profited from the experience of those who had come before him, had carried the study a little further. In 1757 James Lind's famous book on scurvy declared that experiments had demonstrated clearly the value of fruit in the treatment of the disease; in 1804, after his death, regulations enforced the consumption of daily rations of lemon or lime juice in the British Navy. In 1891 Bunge had announced to the world of science that experiments had demonstrated that while mice were unable to live solely on a diet of proteins, carbohydrates, fats, and salts, they survived when a small quantity of milk had been added to the diet. This proved that "other substances indispensable for nutrition must be present in milk besides casein, fat, lactose, and salts." In 1897 Christiaan Eijkman, the Dutch biologist, had produced a vitamin deficiency disease in fowl and had come to the conclusion that the disease was the result of a toxin present in rice. In 1905 the Dutch nutritionist Pekelharing expressed the opinion that an unknown substance of paramount importance occurs not only in milk but in vegetables and in meats. In 1906 Sir Frederick Hopkins undertook a series of experiments to establish the importance of certain amino acids in foods, particularly tryptophan (which he had isolated with S. W. Cole), and in a lecture he vaguely referred to the fact that "some hitherto unknown food elements must be present in a complete dietary."

Very early in his search for the cause of beriberi, Funk discarded Martin's theory that the disease was caused by inadequate protein in the diet and accordingly directed his research toward finding the unknown substance which, by experiments on pigeons, had led him to believe was present in rice bran but not in polished rice. It has been said that the needle-in-a-haystack is an appropriate simile for his search—rice bran and polishings yield as little as one-sixth ounce of Vitamin B-1 per ton. Finally, in 1911 his tedious work was rewarded. He isolated a minute crystalline fraction of material from rice bran capable of curing polyneuritis (a form of beriberi) in his birds. Later when he found the same mysterious substance in yeast he knew he had made an important discovery. Although the crystalline material Funk had discovered was not a pure form of the substance now known as thiamine, it was a far more potent concentrate of its kind than had hitherto been obtained, and his work paved the way for the isolation of thiamine.



CASIMIR FUNK

In his investigations he also found, in 1911, small amounts of nicotinic acid (now called niacine—a part of the B complex), the ingredient the lack of which is the causative factor in pellagra. Funk named these substances "vitamines": "vita," from the Latin, meaning life, plus "amine," the chemical compound, because he had the idea that they all contained nitrogen. The final *e* was later dropped from the name when it was found that not all vitamins contain nitrogen.

The scientist announced his findings in a paper (whose fame, it is said, "will outlast the pyramids") entitled "The Etiology of the Deficiency Diseases," published in the British *Journal of State Medicine* in July 1912. It immediately attracted world-wide attention. In it he presented conclusive evidence that a vitamin is a very definite chemical entity and that various vitamins—not just one—are necessary for normal health; the absence of any one of them would give rise to a characteristic "food deficiency" disease, namely, scurvy, beriberi, probably rickets and pellagra. Benjamin Harrow, the distinguished American biochemist, in a December 1944 article in the *Nation* pointed out how revolutionary the announcement was. It should be recalled, he wrote, that "with the exception of various metabolic disturbances, diseases were associated by physicians of the day with virulent micro-organisms," which Pasteur and others had so impressed upon the world. As in every discovery, there were challengers to Funk's title of "discoverer." The line of reasoning of this group followed that presented by L. H. Harris of the University of Cambridge, in his book *Vitamins* (1937). After describing Funk's 1912 findings as more the development of a theory, or the "systematization of knowledge," Harris conceded that an interpreter is "any man who is able to take a broad view of what has already been done by others, to collect the evidence and discern through it all some common connecting link."

As a warning to the American public, who consumed two hundred and fifty million dollars'

FUNK, CASIMIR—*Continued*

worth of vitamins during one single year, Funk says that it cannot be too strongly stressed that vitamins do not take the place of calories; an insufficient amount of fat, carbohydrate, and protein in the diet will cause starvation even if there is a superabundance of vitamins. "While theoretically it is possible," says the biochemist, "and certainly preferable, to obtain complete requirements from foodstuffs, under present conditions a diet intelligently selected may still be inadequate in vitamins and minerals because of a number of devitalizing factors." Devitalization of food may be caused by improper cultivation (a soil low in minerals will produce vegetation low in minerals and vitamins), transportation, over-processing, prolonged storage, and faulty cooking. As a supplement to a low-vitamin diet, the scientist says, "vitamin intake in synthetic form might often be useful and is sometimes indispensable."

Following his discovery, Funk was granted a Beit Fellowship and in 1913 acquired a doctorate in science. Resigning from Lister Institute, the twenty-nine-year-old scientist became head of the biochemistry department in London's Cancer Hospital, Research Institute (1913-15). The family fortune having had reverses in the first year of the First World War, Funk next accepted an assignment to do chemical research in cancer at Cornell Medical College (1915-16). In the course of his first American residence (1915-23), the scientist was connected also with H. A. Metz and Company as head of their research (1917-23) and was associate in biochemistry at the College of Physicians and Surgeons, Columbia University (1921-23). For the house of Metz, Funk developed, besides adrenaline, salvarsan and oscodol (a concentrate of vitamins A and D from cod liver oil); for another house he developed atophan-cinchophen, a compound used in arthritis.

Funk, who until 1923 had worked in almost every European country except his native Poland, accepted that year the directorship of the biochemical department at the State Institute of Hygiene in Warsaw. (Because the Institute was supported by the Rockefeller Foundation, he says his fourteen-room laboratory was the answer to a biochemist's dream.) It was while working there that he became interested in hormones. In 1924 he demonstrated that there is more than one hormone secretion of the posterior pituitary gland: one which acts on the muscles, and one on the water balance. Three years later Funk, who believed that Poland was politically an "unhealthy" place in which to live because of its unfortunate geographical position, left that country to set up his private laboratory, Casa Biochemica, in a Paris suburb. Later that year he made his second major discovery in collaboration with Harrow and Lejwa. The discovery, which Harrow describes in his article in the *Nation*, established the usefulness of the sex hormones in certain disturbances.

Funk is the author of *Die Vitamine* (1913), which he revised in 1914 and again upon its translation into English in 1922 by Harry E. Dubin. The work deals with the physiological import of vitamins as food components. Funk has also been a frequent contributor to *Science* and other technical journals. The most recent article, written in collaboration with I. M. Chamelin, was "The Action of Liver Extracts in Counteracting the Toxic Effects of Diethystilbestrol Sulfamilamide" (*Archives of Biochemistry*, April 1943).

With the outbreak of the Second World War, Funk returned to the United States, of which he had become a citizen in 1920. He has since been research consultant of the United States Vitamin Corporation and is at present engaged in cancer research with Dr. Edward J. Jacobs in a New York laboratory, where they are working on the Otto Warburg (German Nobel prize winner in 1931) theory that the sugar metabolism of cancer cells differs from that of normal cells. This and other theories, particularly Funk's theory (first advanced in 1913) on the influence of diet on tumors, are now being subjected to rigid experimental and clinical tests. Funk is of the opinion that the study of stimulating and inhibiting factors of the cancer cell will develop new methods in the treatment of malignancy.

In speaking of Funk's work Harrow says the biochemist "has usually been ahead of the ideas warranted by established scientific work. Sometimes one feels that his imagination is more like that of a poet than a scientist." Funk, who is five feet six inches tall and weighs 129 pounds, has large blue eyes, and the flaxen-colored hair of his early childhood has darkened and is streaked with gray. He speaks English with an accent which has been described as a mixture of the five languages which he reads and speaks. He says he has no hobbies and no pet theories about his own diet.

In 1914 the biochemist was married to Alix Denise Schneidesch of Brussels, a handsome woman of French, Spanish, and German stock. Their son Ian, who was born in New York City in 1915 and who was studying medicine when the Second World War broke out, has worked with his father in cancer research. A captain in the Army Medical Corps, he was severely wounded in Europe. Doriane Jacqueline, the daughter, was born in Danzig in 1924; she is in 1945 a student at New York University and served as her father's laboratory assistant. Now living in a Riverside Drive apartment, the Funks have not yet decided if they will exchange the comforts of the New York home for the freedom of the suburban house and laboratory near Paris, where there is a garden with fruit trees and space for pets. Funk says they will doubtless choose the place that offers the best facilities for the completion of his work.

American Men of Science (1938)

GABLE, CLARK Feb. 1, 1901- Actor

Address: b. c/o Metro-Goldwyn-Mayer, Culver City, Calif.

In the Hollywood spotlight since 1931, Clark Gable has enjoyed an unbroken popularity with motion picture audiences. A onetime factory hand, oil-well driller, lumberjack, and stock actor, his wide box-office appeal to women is attributed to what the theater calls "sympathetic identification"—he is the sort of man the American girl might meet in everyday life. The gay adventurer of the screen won the Academy Award in 1934 for his performance in *It Happened One Night*; and the *Motion Picture Herald*'s yearly surveys listed him among the first ten money-making stars from 1932 to 1942, when he entered the United States Army Air Forces. His subsequent three-year absence from the screen did not decrease this popularity either, for *Boxoffice*'s 1945 poll placed him among the ten top male favorites of motion picture audiences.

William Clark Gable (his first given name was dropped when he entered the theater) was born in Cadiz, Ohio, on February 1, 1901. He was the only child of William H. Gable, an oil contractor, and Adeline (Hershelman) Gable, both of Dutch ancestry. After his mother's death when he was only seven months old, he was left in the care of his grandparents until he was five. Then his father remarried, and the little family moved to Hopedale, another small town in Ohio. As a youth, he was shy and awkward, shunning social activities. While in high school he had aspired to be a doctor. Therefore, after graduation, encouraged by his stepmother, whom he describes as one of the tenderest human beings he has ever known, he left for Akron to take premedical courses at Akron University in the evenings—counter to his father's wishes. During the daytime he worked for the Firestone Company, molding treads on tires.

Soon after his arrival in Akron, Gable was introduced to two actors, members of a stock company then playing in that city. Conversation about the theater aroused Gable's interest, and the next evening he went backstage to watch his new friends in the performance. Immediately he was strongly attracted to acting. He spent all his leisure time at the theater, learning all he could about the stage, and within a very short time he had left his job and studies to work as a nonsalaried callboy with the company. Occasionally he also was given a bit part. Of those days Gable has said: "I forgot all my ideas about becoming a doctor when I made my first appearance on the stage. I said only three words—'Good evening, sir.' But those three words were enough. They were hello to acting and good-by to medicine. They changed my entire life."

With an oil boom on in Oklahoma, Gable's father urged him to join him there and try oil drilling. But Gable, determined now to become an actor, left instead for New York. He got a job on Broadway, but not before the footlights. As a callboy, he rapped reverently for nine months on the dressing room doors of John and Lionel Barrymore [43], who in 1919 were co-starring in *The Jest*. Discouraged, Gable left for Oklahoma, where he worked for a year in the oil fields as his father had wished him to do. Despite the fact that he was earning seventy-five dollars a week, he hated the work. With the stage still uppermost in his thoughts, he went from job to job until he had saved enough money to try the theater again. As general utility man with the Jewell Players, a tent show repertoire company, Gable "drove the stakes in the morning, played the cornet in the band before the show started, and then dressed, made up, and became an actor." For this wearing job he received, on an average, the grand total of fourteen dollars a week. The road company, very low in funds, closed after two years, in the winter of 1922. Gable, almost penniless, hopped a freight train to Portland, Oregon. After working at odd jobs—as a lumberjack, a timekeeper at a telephone company, a rodman with engineers, and a want-ad clerk in a newspaper office, he joined a Little Theater group in Portland which was under the direction of Josephine Dillon. "For the first time I learned about acting," says Gable.

CLARK GABLE

In late 1924 Gable and his director were married. Then, hearing that several plays were to be produced in Los Angeles, they went southward, for Gable hoped to gain more stage experience before trying his luck again on Broadway. Unsuccessful in his attempts to obtain work in the theater, Gable reluctantly turned to the silent films. He made his first appearance on the screen in a picture starring Pola Negri. "I worked a few days at that," recalls Gable, "and couldn't seem to find out what it was all about. I was in a hot uniform, held a sword, and got five dollars a day." Deciding that his income as an extra was too small and uncertain to warrant any longer stay in Hollywood, Gable and his wife were about to leave when he secured a part as spearbearer in a Los Angeles stage production of *Romeo and Juliet* starring Jane Cowl. When the same company hired Gable for a minor role in *What Price Glory*, the actor had his first bit of good fortune. The player originally intended for the important part of Sergeant Quirt left the cast, and Gable was given the role.

Afterward, disheartened by an unfavorable screen test, Gable worked for a while with a Texas stock company and then headed for Broadway. "Motion pictures," says Gable, "had not begun to talk. In those days leading men had to be Valentinos or John Gilberts, handsome fellows, great lovers, and pleasing to

GABLE, CLARK—*Continued*

behold. I didn't fit into those classifications. I was somewhat of a roughneck. Definitely, I could see no future for me in Hollywood." Fortified with several letters of recommendation, the actor got the part of the Young Man in Arthur Hopkins' New York production of *Machinal* (1928). The *Telegraph* described Gable as "young, vigorous, and brutally masculine." The *New Yorker* found him an "excellent lover," and, in the words of the New York *Time*'s critic: "Gable played the casual, good-humored lover without a hackneyed gesture." Back in Los Angeles, three years later, he was given the role of Killer Mears in a local production of *The Last Mile*. This play had a twofold significance for the actor—his portrayal of Killer Mears was considered a minor triumph; and his impressive performance brought forth this comment from Lionel Barrymore: "I think you'd be good in pictures. I'd like to have a test made of you."

Gable, much influenced by Barrymore's opinion, decided to give motion pictures another try. He played his first role in the "talkies" as the villain in *The Painted Desert* (1931). "He wasn't a very good cowboy . . . but the lady fans liked him." Gable then returned to the theater for a while, but now he was only biding his time hoping for a second chance to get into pictures. At this time, after being divorced from his wife, he was married to Mrs. Ria Langham, a woman ten years his senior. Their marriage lasted only five years, but Gable says he will always be grateful to her for the encouragement she gave him during the early days of his motion picture career.

The introduction of the talking picture had brought with it a new demand for leading men. Talent scouts were eagerly searching for new faces, but, although Gable had been brought to their attention, there was no clamor for his services. However, there were some producers who were interested enough to experiment with various techniques of photographing the actor. They found that a certain type of lighting and "a three-quarters shot" of Gable softened his face and made his large ears less conspicuous. In fact, they even ventured to say that he might capture a few feminine hearts. Gable made his debut as a leading man in 1931, playing opposite Joan Crawford in *Dance, Fools, Dance*. Next, with Norma Shearer in *A Free Soul* (1931), he was described by one critic as "a fascinating villain" who had convinced the female customers that he was "naughty but nice." In the next few years his performances (mostly for Metro-Goldwyn-Mayer) in *Hell Divers* (1931), *Susan Lennox, Her Rise and Fall* (1931), *Possessed* (1931), *Polly of the Circus* (1932), Eugene O'Neill's *Strange Interlude* (1932), *Red Dust* (1932), *No Man of Her Own* (1932), *The White Sister* (1933), *Hold Your Man* (1933), *Night Flight* (1933), and *Dancing Lady* (1933) classed Gable as "just a good leading man"—opposite such top leading ladies as Greta Garbo, Marion Davies, Norma Shearer, Jean Harlow, Carole Lombard, Helen Hayes '42, and Joan Crawford. A victim of type casting, he was usually given the role of a "heavy" with redeeming traits. Gable asserts: "People were bored instead of delighted when I manhandled disagreeable women, and I was getting pretty sick of it myself."

In 1934 Clark Gable achieved stardom. Columbia Picture's still popular photoplay *It Happened One Night* "untyped" Gable and proved him to be a versatile actor. Gable, relaxed and casual, entered completely into the spirit of the story—a lively comedy about a runaway heiress and a newspaperman traveling from Miami to New York by bus. (A statistical item observed by the picture's publicity office was the 43 per cent increase in women bus travelers that year.) Both Gable and his leading lady, Claudette Colbert '45, received Academy awards for the best performances of the year. The following year Gable turned in another outstanding performance in the exciting film *Mutiny On the Bounty*, chosen by the Academy of Motion Pictures Arts and Sciences as the best film of 1935. Gable refers to this saga of the sea as his favorite film because "it was something you could get your teeth into, for it was history, a story of the struggle of real he-men with a refreshing absence of the usual load of love interest."

In the next seven years, as one of MGM's top stars, he appeared in over twenty-five pictures, prominent among which were *China Seas* (1935), *San Francisco* (1936), *Saratoga* (1937)—Jean Harlow's last film—*Test Pilot* (1938), *Idiot's Delight* and *Gone With the Wind* (1939), *Boom Town* (1940), *They Met in Bombay* (1941), and the last picture before his temporary retirement, *Somewhere I'll Find You* (1942).

In March 1939 Gable married Carole Lombard, Hollywood's "best screwball comedienne." Less than three years later, on January 16, 1942, she was killed in an airplane crash near Las Vegas, Nevada, while returning to Hollywood from a bond-selling tour. A week after his wife's death Gable announced that he would retire from the screen and made application for duty in the United States Army Air Forces. In August 1942 he was inducted into the Army of the United States as a private, and assigned to the Army Air Forces Officer Candidates' School at Miami, Florida. Indicative of his desire for action was his statement: "What I want is to be a machine-gunner on an airplane and be sent where the going is tough." Competing with classmates who had had a more extended formal education, Gable, only a high school graduate, was at a distinct disadvantage. But he graduated in the upper third of the class, explaining this accomplishment by saying: "I committed the manuals to memory." (His instructors are certain that the former actor had studied during many of the hours assigned to sleeping.) His classmates chose him to give the graduation address, on October 28, 1942. "Our job," Lieutenant Gable said then, "is to stay on the beam until—in victory—we are given the command 'fall out.'"

Sent over to England in April 1943, the new lieutenant was assigned by order of General H. H. Arnold '42, chief of Army Air Forces, to produce an aerial gunnery film designed to increase recruits for gunnery training. During six months of overseas service Gable, with the help of a six-man crew, "shot" fifty thousand feet of sixteen-millimeter color film revealing combat conditions over Antwerp, two unnamed targets near Paris, southern France, and the Ruhr Valley. This film, in which Gable is narrator and occasionally an actor, shows how air force men live, work, and fight. In November 1944 the Office of War Information announced that it would not be released for the general public since it is largely a duplication of the picture *Memphis Belle* (1944). The film is available for showing at bond-rally drives, war plants, and club meetings.

In October 1943, just prior to his return to the United States, Captain Gable received the Distinguished Flying Cross and the Air Medal, the latter for "exceptionally meritorious achievement while participating in five separate bomber combat missions." The citation said, "His courage, coolness, and skill in five missions reflect great credit on him and the armed forces." In May 1944 he was promoted from the temporary rank of captain to the temporary rank of major. The following month he returned to civilian life and was placed on the Army's inactive list, subject to recall. Finally discharged in 1945, by December of that year he had finished his first postwar picture, *Adventure,* with Greer Garson, and had begun work on *Lucky Baldwin.*

Of the Clark Gable who went to war Adela Rogers St. Johns wrote this observation: "The men liked him because he was literally one of them. . . .Yet when Gable talks about them you'd think every member of the [bomber] crew had done him a favor to accept him and approve him." And of the man who came back to America in 1945, after combat flying over Germany, she said: "The twinkle with which he'd always faced life until the death of his wife, Carole Lombard, was back." Clark Gable seldom discusses his "art" with anyone. Attributing his success to luck, he has hung his dressing room with mementos of the days when he was only a struggling actor. Across these mementos he has written the words: "Just to remind you, Gable." He plays excellent golf, likes to ride horseback, and is fond of long hunting trips. His favorite reading consists of adventure stories and mysteries.

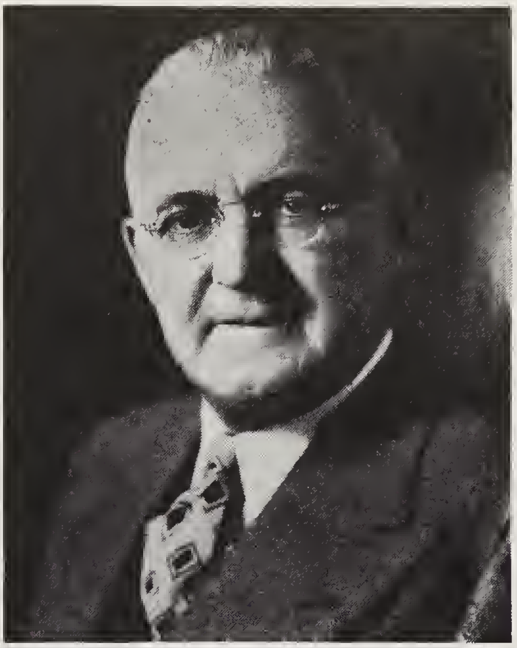
GANNETT, FRANK E(RNEST) (găn-nĕt') Sept. 15, 1876- Newspaper publisher
Address: b. 55 Exchange St., Rochester, N.Y.; h. 195 Sandringham Rd., Rochester, N.Y.; 5641 Collins Ave., Miami Beach, Fla.



FRANK E. GANNETT

A newspaper publisher since 1906, when he bought a half-interest in his first newspaper, Frank E. Gannett in 1945 is the owner of one of the largest newspaper groups in the United States. The newspapers, numbering twenty-one, are with three exceptions concentrated in middle-sized cities in upstate New York. Their combined circulation is more than half a million. Enlarging his activity in the field of information Frank Gannett has also bought an interest in several radio stations. In 1937 he founded the group now called the Committee for Constitutional Government. This committee is said to have been responsible in large part for the defeat of several New Deal measures and has earned for him from New Deal supporters the label of "economic royalist." This he forcefully resents. It has been pointed out that he "has arranged to perpetuate his newspapers as a foundation, excluding his family from control in the enterprise and insuring continued employment of those who helped him to succeed." Shortly after the establishment of the Foundation Gannett put into effect an employee profit-sharing plan.

Born on a farm in the New York State Finger Lakes district, near the town of Bristol, on September 15, 1876, Frank Ernest Gannett is the son of Joseph Charles and Maria (Brooks) Gannett. The first Gannetts to live in America emigrated from Dorsetshire, England, in the sixteen-thirties, settling in Hingham, Massachusetts. Warren Gannett, the publisher's grandfather, farmed a tract of land north of Syracuse, New York, which he had been granted as a veteran of the Revolution. The farm on which Gannett was born had been cleared from the wilderness by his

GANNETT, FRANK E.—*Continued*

father and uncles. Later, when it proved to be submarginal land and failed to support them, the Gannetts became tenants on a farm near Blood's Depot (now named Atlanta), New York. It was there, at the age of nine, that Frank Gannett began earning money. His newspaper career might be said to date from that time, for among his many odd jobs was delivering a Rochester newspaper to local subscribers—a paper he was to own years later. Tenant farming proving to be no more remunerative for Joseph Gannett than his first farming (a veteran of the Civil War, he was handicapped by ill health), he and his family moved to another village in New York, where he leased the small hotel, little more than an inn for mail coach travelers and freight wagon teamsters. Before young Frank was fifteen years old his father had failed to make much progress in the hotel business in three small towns in New York, and was planning to to another town for still another try.

This time the boy did not accompany his parents. The high school principal in Bolivar (the town in which the Gannetts were living at that time), encouraged Frank to continue his studies in Bolivar inasmuch as he had made a fine record there as a student. While attending high school the boy earned his living by doing chores in the Newton House, the successful rival of his father's former hotel. He waited on tables and on occasion substituted for the regular bartender. Graduated from high school at sixteen, but lacking the means to continue his education, young Gannett remained in Bolivar to work as a bookkeeper for two firms. In the New York State Regents' examinations he received the highest diploma that any high school student had then received. A Congressman offered him an appointment to the United States Military Academy. The four-year course at Government expense tempted him, but his mother, who had suffered so much as the wife of a disabled war veteran, dissuaded him. A few months after making his decision he won a Cornell University scholarship in a competitive examination conducted by the Department of Instruction of the State of New York.

Gannett, who arrived at Cornell with eighty dollars as his sole capital, during his college years not only succeeded in supporting himself, but, by his graduation in 1898 with a B.A. degree, he had accumulated a bank deposit of one thousand dollars. In his freshman year he supported himself by waiting on tables, running a laundry route, and doing other small jobs. By the end of that year he had been elected representative of the class of 1898 for the college newspaper, the Cornell *Sun*. It was his first writing job. Campus reporting at three dollars a week for the Ithaca *Journal* followed. Soon Gannett-written items were appearing in the Buffalo *News*, the New York *World*, and a dozen other newspapers. His first two summer vacations were spent in the rural districts of New York as a salesman for the *Cottage Physician*, a volume which undertook to tell people what to do before the doctor arrived. Although it was harder to sell a farmer something in those days than to "float a stock issue in downtown New York," the energetic student earned enough money to spend six weeks of his third college vacation working without pay on the Syracuse *Herald* so that he might gain practical experience in his chosen field, journalism. Making good, he finally won from the *Herald* a ten-dollar weekly pay check for the rest of the summer.

When in 1899 the president of Cornell, Jacob Gould Schurman, became head of the first Philippine Commission, young Gannett accompanied him to the Islands as his secretary. (Gannett had been graduated the year before.) One achievement resulting from his residence there was his translation, from the Spanish, of *Friars and Filipinos* (1900). When the Schurman commission was recalled to the United States, Gannett, left in charge of the Manila office, learned enough about colonial problems to make him intensely anti-imperialistic. Consequently, when offered reappointment to his secretaryship by William Howard Taft, Schurman's successor in the Philippines, Gannett declined.

Upon his return to the States in 1900 Gannett became city editor of the Ithaca *Daily News* at a salary of fifteen dollars a week, and during the next five years rose to the positions of managing editor and business manager. For a part of this time he also acted as editor of the Cornell *Alumni News*. In 1905 he left Ithaca, working for a few months on *Leslie's Weekly* in New York City and for a few more months as editor of the Pittsburgh *Index*. The post failed to come up to his expectations, Gannett resigned, and shortly afterward bought a half-interest in the Elmira (New York) *Gazette*. This deal established Gannett's ability to obtain credit—the owner had asked twenty thousand dollars for the half-interest, but Gannett, having only three thousand in cash, paid the remaining amount in notes and money borrowed with only his good reputation behind him. The year was 1906—Gannett was twenty-nine years old and half-owner of a daily newspaper. In 1907 he bought the Elmira *Star* and merged it with the *Gazette* under the name of the *Star-Gazette*.

The Gannett chain of newspapers enlarged in 1912 when the thirty-six-year-old publisher bought the Ithaca *Journal*, which was later merged with the Ithaca *News* to form the Ithaca *Journal-News*. In 1918 the publisher took up residence in Rochester—location of his present home and business—when he and two associates, Erwin Davenport and Woodford J. Copeland, bought the Rochester *Union and Advertiser* and the Rochester *Evening Times*, which they merged into the Rochester *Times-Union*. By 1924 the publisher, who had bought his first newspaper on credit, was able to buy out his partners' interests in the *Times-Union* for two million dollars; by 1943, with the purchase of the Binghamton (New York) *Press*, he controlled a group of twenty-one newspapers located in sixteen middle-sized cities in four different states. Gannett is also chairman of the board of directors of the American *Agriculturist*, a semi-monthly publication. The publisher's only venture into metropolitan dailies proved to be unsuccessful—the Brooklyn ***Eagle***, bought in 1929, was sold in 1932 after Gannett had decided that because of the growing depression it was wise to lessen his debt burden. He says he took a big loss on the sale of the paper.

Samuel T. Williamson's *Frank Gannett, a Biography* (1940) is the story of the publisher's rise from newsboy to newspaper owner, in which his interest in economic problems is given full exposition: Gannett operates his newspapers on "the autonomous policy" that publisher, editor, and employees of each should be local people who know the needs of their communities. With the exception of the Rochester *Times-Union*, none of Gannett's papers, says Williamson, editorially reflects Gannett's views. There has been no standardizing or rebuilding of Gannett's papers to a fixed plan. Gannett's only stipulation has been that the management give its city a "clean, fair, independent, constructive newspaper . . . fit to enter the home and be read by every member of the family." Before and after the repeal of the Eighteenth Amendment, Gannett's newspapers, at a loss in revenue estimated at one million dollars annually, refused all liquor advertisements. Although he is a total abstainer, Gannett is not a militant prohibitionist. His position is simply that such advertisements have no place in a newspaper read in the home. In the editorial sphere Gannett, who dislikes wordy articles, advises his staff to eliminate "lazy," useless words in writing.

In acquiring his group of papers Gannett has taken several financial risks. One of these was in 1929. The year before when he decided to buy two Albany newspapers, the *Knickerbocker Press* and the *Evening News*, he gave Archibald R. Graustein, president of the International Paper Company, four hundred and fifty thousand dollars' worth of stock in the papers as collateral for the loan. "It was understandable," said Gannett's biographer Samuel Williamson, "that Graustein [whose company was going increasingly into power utilities] should want more Gannett newsprint business," but, according to the writer, the transaction did not give the power trust influence in the editorial policy of the Gannett newspapers. (Later Gannett borrowed two million more to purchase the Brooklyn *Eagle*.) "As long as his borrowings from Graustein remained and International Paper Company held his securities," continues Williamson, "Gannett's papers continued to attack the power trust as they had before. Although he has changed his views since, Gannett then favored municipal ownership of city light and power plants, and supported ownership of power in wider fields."

When the Federal Trade Commission in 1929 began an investigation in Washington of the power trust's "machinations to control public opinion," the Hearst newspapers, "with which in Rochester and Albany Gannett had dared to compete, employed considerable black type in the exposure of Gannett's arrangement with International Paper. Gannett was pictured as bought by the power trust." When Gannett was called to Washington by the FTC for questioning (at which he was exonerated), he made what his biographer calls a characteristically audacious decision. Within a few hours he had borrowed from the Chemical National Bank of New York City two and a half million dollars, for which he gave the bank a four-month note, so that he might buy back his securities from Graustein. With this little matter settled between trains, Gannett went on to Washington. When his associates learned of his short-term note to the bank, however, they feared that for once Gannett had been foolhardy. But Gannett came through—half of the bank loan was paid by selling an issue of Gannett Company, Inc., preferred stock to employees. The *Christian Science Monitor* reported in 1940 that more than one-fourth of the four thousand employees owned one-third of the almost seven and a third million dollars of the preferred stock outstanding, representing the total indebtedness of the Gannett newspapers, with the properties conservatively valued at twenty-five million dollars.

"Gannett," says his biographer, "believes in the private competitive economic struggle. Yet he also believes with his whole heart that private property should respond to the call of general welfare. He has gone to considerable pains to see to it that Gannett newspapers, in their continued existence and in their profits in the days to come, shall heed that call." In September 1935 the publisher announced the formation of the Frank E. Gannett Newspaper Foundation, Inc. Ultimately the Foundation will own all of Class A common stock of the Gannett Company, Inc., and its resources will be devoted exclusively to "public, charitable, educational, and general philanthropic uses and purposes" in localities served by the Gannett newspapers. At least 75 per cent of its net income must be distributed in the year of its receipt. At least nine of its eleven directors must be experienced newspapermen. "These eleven self-perpetuating directors after Gannett's death will exercise control of the Gannett company by electing its board of seven directors, preferably from their own number; and the Gannett company board in turn shall elect a general manager." The *Christian Century* in commenting said, "What it means in a word, is that the responsible management of these influential newspapers will be in the hands of men thoroughly experienced in journalism but having no financial interest in the accumulation of inordinate profits . . . a control as disinterested as the control of a university."

Gannett first came into the political limelight in 1936—although he was not to win a public office—when he accepted an invitation of the Borah-for-President forces to run for Vice-President on the Republican ticket in the Ohio primaries. The Baltimore *Evening Sun* called the union of the two men "practically perfect," and the New York *World-Telegram* and other independent newspapers added their approval. That year Gannett took an active part in the Republican National Convention, and in September in the New York State Convention his name was put in nomination for governor. In 1940, after his candidacy for the Presidential nomination was launched, he toured the country in his private plane in a campaign reported to have cost several hundred thousand dollars. The New York *Herald Tribune* stated that the Gannett forces

GANNETT, FRANK E.—*Continued*

staked their hopes on a platform in defense of constitutional government and private enterprise. After Gannett lost the nomination to Willkie '40 many upstate New York Republicans advocated his candidacy for United States Senator. Appointed assistant chairman of the Republican National Committee in September 1942, Gannett resigned in November, but shortly afterward was in the race for the office of the chairman of the committee, a post to which Harrison Spangler was appointed.

In 1944, said *Editor and Publisher,* Gannett was one of the men upon whom Dewey leaned for advice; often in the company of the nominee, he came and went "much more frequently than any of the rest without the general public being aware of it." After the defeat of the Republican Party in the 1944 Presidential election Gannett proposed the formation of a national coalition party to "unite the Democratic Party of the South and the Republican Party of the North on national questions." Declaring that the Republican Party had failed to win the election because it "did not present a great burning issue," the publisher said that a vigorous effort had been made the previous summer to form such a coalition, "but the Republicans thought they could win without concessions to the South."

The Committee to Uphold Constitutional Government was founded by Gannett in 1937. (In 1939 he resigned as chairman of the committee, which was later succeeded by the Committee for Constitutional Government, of whose board he is now a member.) His committee is regarded as one of the strongest factors that brought about the defeat of four of the Administration's measures: Roosevelt's Supreme Court proposal, the Reorganization Bill, the attempt to purge the anti-New Deal Democrats in the 1938 elections, and the recovery (spending-through-lending) measures in 1939. Other New Deal measures attacked by the committee are the plans for food subsidies and the Wagner '41-Murray-Dingell Bill for an expanded social and health security program. And, in addition, it has been working through the state legislatures for an amendment to the Constitution limiting the taxing power of Congress. The amendment it sponsors would prohibit Congress from levying an income, estate, or gift tax of more than 25 per cent. Thus far seventeen of thirty-two state legislatures required for the calling of a Constitutional Convention have approved the resolution. Opponents of the proposed amendment claim that, if passed, it would destroy the principle of progressive taxation and drastically reduce the Government's revenue.

In the fall of 1944 the Senate Special Committee to Investigate Lobbying Activities undertook to investigate the Committee for Constitutional Government under the Hatch Act. During the course of the hearing Edward A. Rumely, executive secretary of the committee, refused to submit its subscription list on the grounds that the founders considered the group "educational, and not political, and, therefore, outside the [House] committee's jurisdiction." When Rumely was indicted for this refusal, Gannett issued a statement that officers and trustees of the Committee for Constitutional Government stood squarely back of Rumely. Contending that a great constitutional issue was at stake, Gannett declared that the committee was determined to bring the issue to a test in court. Although admitting that the committee had distributed many pamphlets and articles (reported to be more than eighty million) attacking the New Deal, Rumely said that it had "urged no one to support or defeat any candidate or party," and had confined itself to the "area of ideas." In its final report in January 1945 the House committee emphasized that "under the present law it is difficult to penalize such groups," because of their assertions of nonpolitical activity. They were therefore "not subject to the law requiring major parties to show their records and disclose the source of their funds to Congress." (Among the organizations under investigation at this time was the CIO Political Action Committee.) The Rumely trial (United States *vs.* Edward A. Rumely) in October 1945 resulted in a "hung" jury, largely over the definition of "politics," and a retrial was ordered. In August 1943 Gannet had come into public notice in connection with the discussion of the Committee for Constitutional Government by John Roy Carlson '43 in the latter's book *Under Cover.* The publisher of the book, E. P. Dutton, charged Gannett, among others, with attempting to curb sales of the book by warning booksellers of the possibility of libel suits.

When Roosevelt in his campaign speeches of 1944 described the Gannett newspapers as isolationist, the publisher assailed the statement as false, and pointed out that as early as 1935 he had urged the President to call a conference of leaders of important European nations to remove the causes "that were fast bringing on the present and greatest of all tragedies." "My attitude then," he said, "certainly was not that of an isolationist and never has been." In 1937 the *Rotarian* published an article by Gannett in which he declared that he believed "the one practical and effective step toward peace" is the establishment of a Department of Peace in the cabinets of the nations of the world, beginning with that of the United States, a proposal which, he adds, is not at all new. His 1940 stand on foreign policy was like the plank which both Democrats and Republicans later included in their platforms—for keeping America out of the war.

The publisher's interest in the problems of industrial relations led him to visit England in 1938 for a study of British industrial conditions, which he believed had much of value to offer both management and labor, "especially in the field of collective bargaining." The result of his study was published under the title *Industrial and Labour Relations in Great Britain* (1939), a symposium of the opinions of prominent Englishmen, which Gannett edited in collaboration with Benjamin F. Catherwood. *Management Review* recommended it to any student of the problem as "an exceedingly worthwhile treatment." *Survey Graphic,* on the other hand, thought that "on the whole the symposium hardly seems worth while," and that Gannett's introduction to the essays "is an expression of his personal views," which shows "no reflection of the hot fire of original work."

Another trait of Gannett's, says Williamson in his biography of the publisher, is his foresight. In 1920 for the first time in history the returns of a Presidential election were broadcast over the radio. "To most persons at the time this first radio news broadcast was a stunt of little significance—but Gannett heard about it and wondered." The following year Gannett, backing Lawrence G. Hickson, a student of the Mechanics Institute who had been experimenting for some time with wireless telegraphy, acquired an interest in WHQ, a Rochester radio station. He showed less foresight when he sold his interest in 1927 for six thousand dollars—the station is reported to be worth more than a million today. However, Gannett today holds an interest in eight stations in six different cities. He is also the promoter and director of a time-saving machine which is now being manufactured by the Teletypesetter Corporation.

Amidst his many activities the publisher has found time to support causes outside his immediate range of interests. In 1942 he was chairman of the Navy Relief Society's New York State Citizens' Committee and chairman of the Naval District of the relief society. In 1943 he was a speaker at the National Conference for Palestine, joining Chaim Weizmann '42 and other noted persons in condemning the 1939 White Paper issued by the British Government to restrict Jewish settlement in Palestine. In 1943 he served as chairman of the National Food Conference, which he called at the request of agricultural officials of sixteen states. For many years he has been active in newspaper associations: he was president of New York State Associated Dailies (1916-17), the New York Press Association (1917-18), and the New York State Publishers Association (1921-27). He was a member of the board of directors of the Associated Press from 1935 to 1940. As a member and president of the Cornellian Council (1925-26) Gannett has long served Cornell University and in 1926 was made a trustee. He is a member of the board of directors of the Rochester Institute of Technology, has been a trustee of Keuka College since 1924, and was for years a member of the Finger Lakes State Parks Commission. His honorary degrees include an M.A. from Wesleyan University (1929), LL. D.'s from Alfred University (1935), Hobart College (1937), and Hartwick College (1941), a Ph.D. from Oglethorpe University (1939), a Litt. D. from Keuka College (1939), and in 1937 he was made an honorary member of Phi Beta Kappa.

In 1920 the publisher was married to Caroline Werner, daughter of the late Justice William E. Werner of the New York State Court of Appeals. She is a native of Rochester but was educated abroad and in Rosemary Hall, Greenwich, Connecticut. The Gannetts have two children, Sally and Dixon. In speaking of her husband, Mrs. Gannett has said, "I've watched him grow from a little businessman to a big businessman without any show of growing pains." During his 1940 national campaign Mrs. Gannett addressed various women's organizations in his behalf. The Gannetts have two residences, one in Rochester and one in Miami Beach. Their recreations are golf and yachting. The publisher is five feet ten and one-half inches tall, and weighs one hundred sixty-two pounds. Although Gannett was born of a Methodist family, he is a Unitarian; and he succeeded William Howard Taft as director of the American Unitarian Association. Mrs. Gannett attends a Presbyterian church, their daughter is an Episcopalian, and their son, by his own choice, goes to a Reformed church Sunday school.

GANNON, ROBERT I(GNATIUS), REV.

Apr. 20, 1893- University president

Address: Fordham University, E. Fordham Rd. and Bronx Park, New York City

REV. ROBERT I. GANNON

Since 1936 the Very Reverend Robert I. Gannon, S.J., has been president of Fordham University, largest Catholic university in the United States. The son of well-to-do Catholic parents of Irish descent, Robert Ignatius was born in St. George, Staten Island, New York, on April 20, 1893. His father was Frank Stanislaus Gannon, at one time president of the Norfolk Southern Railroad, a director of the Metropolitan Street Railway Company and of the Emigrant Industrial Savings Bank. His mother was Marietta (Burrows) Gannon. (Dr. James A. Gannon of Washington, D.C., is a brother of Father Gannon, and a sister-in-law, Mrs. Frances Foley Gannon of Staten Island, is director of the Bureau of Consumer

GANNON, ROBERT I., REV.—*Continued*

Service and is known as "housekeeper to eight millions.") Robert, a "slim, curly-headed boy," attended the Loyola preparatory school in New York, graduating in 1909. He then went on to Georgetown University in Washington, D.C., from which he received a B.A. degree in 1913. In the same year he entered the Society of Jesus. He received an M.A. degree from Woodstock College in Maryland in 1919, and then began teaching as a Jesuit scholastic. (A "scholastic" in the Society of Jesus is one who has completed his novitiate and taken simple perpetual vows, after which he remains in the ranks for several years, teaching or studying in a Jesuit school until he is ordained.) From 1919 until 1923 Gannon was instructor and then assistant professor of English and philosophy at Fordham University. During this time he directed student dramatics and founded the Fordham Playhouse.

Father Gannon was ordained in 1926. The young priest went abroad after his ordination, receiving the degree of Doctor of Sacred Theology at the Gregorian University in Rome in 1927, and studying educational methods at the Sorbonne, Oxford, Cambridge, Perugia, and Louvain. At Christ's College, Cambridge, he received an M.A. degree. Back in the United States, in 1930 the Jesuit Father General sent him to Jersey City, New Jersey, to reopen St. Peter's College, which had been closed since the First World War. Four rooms, with an adjoining kitchen for a laboratory, were rented from the Chamber of Commerce, and the little college of eighty students opened with Father Gannon as dean. Three years later Father Gannon opened the Hudson College of Commerce and Finance, also in Jersey City, where he remained for three years. In June 1936, when Father Aloysius J. Hogan, president of Fordham, received orders from Rome to go to Georgetown University as dean, the Reverend Dr. Gannon became his successor at Fordham.

Fordham University was founded by the Right Reverend John Hughes, D.D. (who later became the first Archbishop of New York) upon the old Rose Hill farm in the borough of the Bronx of New York City. The new institution was formally opened with six students on June 24, 1841, and was called St. John's College. For five years the college was conducted by the diocesan clergy of New York; in 1846 it was placed under the direction of a band of Jesuits who came at Bishop Hughes's invitation from St. Mary's, Kentucky. Fordham has since then remained under Jesuit direction. In 1907, after the opening of the schools of Medicine and Law in 1905, an amendment to the charter of the college by the regents of the University of the State of New York changed the corporate name to Fordham University.

When Father Gannon became president in 1936 Fordham had an enrollment of almost eight thousand students. It was, in the words of *Time* Magazine, "an up-to-date university [noted for] a big-time football team, a world-famed seismograph station, a Nobel Prize winner . . . schools of law, business, social service, pharmacy." As Father Gannon began his presidency he made it clear that he had no ambitions for further expansion of the university, but wanted to concentrate on its extracurricular activities. During his administration he has been responsible for many improvements. New buildings have been constructed, there have been administrative changes, scholarship and research facilities have increased, and he instituted the custom of publishing Fordham's annual accounts, an unusual procedure among Catholic college presidents. By 1945 Fordham University had twenty-six buildings on the Bronx campus, annexes in midtown and lower Manhattan. (The School of Adult Education is a recent addition to the university.)

In September 1941 Fordham held its centennial celebration and also commemorated the four hundredth anniversary of the arrival of the Jesuits in America. Delegates from more than five hundred colleges, universities, and learned societies in the United States and foreign countries gathered at Fordham for a three-day observance. At this time, with the entry of the United States into the war imminent, Father Gannon said, "Our lives are being lived for ideas, not for books, and we are not in an ivory tower. We are manning a lighthouse, and the darker the clouds, the more need there is for light. . . .The fact is, we have never felt more necessary."

At Fordham's ninety-fifth commencement in 1940 Father Gannon warned against "military armament without moral armament," and cited Fordham's chief responsibility to the United States as the cultivation of sound patriotism. Although he had been strongly opposed to the United States entrance into the Second World War, when the university opened in September 1942 Father Gannon admitted at the opening exercises that he thought he had been wrong in being an isolationist. "Today it is humiliating, but many of us are ready to stand up in meeting and confess that we were wrong. . . .It was our war from the first." Newspapers and magazines praised his honest stand at this time.

The years of the Second World War, described by him as "a brand new worry to sharpen her [Fordham's] wits," held many international interests for Father Gannon. In the spring of 1943 he accepted an invitation to preach a series of Lenten sermons at Westminster Cathedral in London and spent two and a half months in England. In the fall of that year, as a tribute to Poland, a room in Keating Hall on the Fordham campus was dedicated as the Lublin Room. In the dedication ceremony Fordham formally adopted the Catholic University of Lublin for the duration of the war, the room becoming symbolically the wartime home of the Polish university which had been taken over by the Germans. The honorary degree of Doctor of Laws was conferred on Wladyslaw Raszkiewicz, President of the Polish Government-in-Exile and received by the Polish Ambassador, Jan Ciechanowski. Later, in gratitude, President Raszkiewicz awarded to Father Gannon the insignia and diploma of the Grand Commander's Cross, with Star of the Order of Polonia Restituta.

In March 1944 Father Gannon participated in the St. Patrick's Day celebration in New York City, and at this time paid tribute to Eamon de Valera '40, Prime Minister of Eire, whom he described as "a man of principle and hence a conspicuous figure in world affairs." Annually the Feis of Tara, an ancient Irish festivity, is celebrated on the Fordham campus with songs, dances, and games. Father Gannon, honorary chairman of the twelfth (1944) annual celebration, asked that the day also be made one of prayer for loved ones fighting in the war. On February 18, 1945, the Fordham president presided at the "One World" dinner held at the Hotel Astor to honor the memory of Wendell Willkie '40. Before the war, in 1938, the Catholic educator had visited Venezuela as a member of a cultural commission invited by President Lopez Contreras to advise the Government on educational matters. In 1945 he was again invited to South America, this time to help in the organization of the Institute of Brazilian Studies and to lecture in São Paulo on American education.

"The very square-jawed" Father Gannon received the 1942 award of the New York Academy of Public Education for "distinguished service in the field of education." Some of his convictions, which he has expressed in a fine dramatic voice and in a manner described as "urbanely dogmatic," are: "The college course should be reduced to three years, high school to three years, and grammar school to six. Then, if compulsory military training is introduced, the loss of a year will not be serious." Students should be taught obedience to the constituted authority simply because it is the constituted authority. ("We do not expect to argue with a Fordham freshman. We expect him to do as he is told.") "No one has any clear idea what it [academic freedom] means. . . .Men have been allowed in the academic world a license which is justly denied in every other. . . .For anyone in a cap and gown can hack away at the foundations of life, can rob our sons and daughters of all the principles on which civilization depends—but let him so much as whisper 'Academic Freedom' . . . and no professional educator dares to say a word of criticism." Father Gannon feels that there is much wrong with progressive education; he disapproves of the elective system. He emphasizes the importance of graduate study, and in January 1945 announced that two scholarships would be given by Fordham to cooperate in a plan for bringing students from the Netherlands to the United States for graduate study in subjects useful in postwar reconstruction.

At the end of the war President Gannon, with other college presidents, agreed that acceleration had been a necessary evil. Compressing four years of college into three was unpopular with students and faculty, and the impression, he said, was staleness on the part of the teachers and indigestion on the part of the students. Of Fordham's postwar football plans, Jack Coffey, the athletic director, announced in December 1945 that the university would resume its playing of intercollegiate games in 1946. Big-time football, however, he added, would probably not be seen at Fordham for several years. Father Gannon, one sports writer pointed out, is opposed to it and is not likely to change his position.

Father Gannon is the author of *The Technique of the One-Act Play* (1925) and has contributed numerous articles to periodicals. Honorary degrees have been conferred on him by Georgetown, Holy Cross, New York, and Rutgers universities, and by Columbia, Boston, Bowdoin, and Manhattan colleges. He is a trustee of New York Town Hall and of the New York Zoological Society, an elective manager of the New York Botanical Garden, an honorary life member of the Newcomen Society of England, and a director of the Pan American Society. He is also a director of the American Arbitration Association and the Netherlands-American Foundation, was a member of the Advisory Committee on Adult Education of the Columbia Broadcasting System until its demise, and was elected president of the Association of Colleges and Universities of the State of New York, in October 1945. In addition, the educator serves on the advisory committees of the Boy Scouts of America, the American Red Cross, and the Bronx Chamber of Commerce. He is a member of the Century Club of New York.

At the time of Fordham's centenary celebration *Time* described Father Gannon as a small, genial person who "had a wonderful time . . . bouncing among his guests, helping them to tea, conferring honorary degrees (in Latin) on bigwigs." He is noted for the "Irish wit and wisdom"—and sometimes irony—in his speeches and radio talks. Illustrative of his humor was the introduction to a talk which he once gave at a St. Patrick's Day celebration: "To speak of St. Patrick to the Society of the Friendly Sons of St. Patrick," he said, "is like a travel-lecturer preparing to tell his audience about a visit to Tibet and then looking down into his audience and seeing Marco Polo—or Eleanor Roosevelt."

GARAND, JOHN C(ANTIUS) (găr'ănd kän'tsyüs) 1888- Inventor

Address: b. Springfield Armory, Springfield, Mass.; h. 25 Wilton St., Springfield, Mass.

Relatively few people have heard of John C. Garand, but nearly everyone knows of the Garand rifle, official arm of the United States Army and Marine Corps, which is generally considered the best rifle in the world. Like the Norden '45 bombsight, it was designed by a researcher born outside the United States who presented his invention to the United States Government royalty-free, drawing no profit from the millions of dollars expended for it.

John Cantius Garand was born in 1888 on a farm in the French-Canadian village of St. Remi, about twenty miles from Montreal. He does not remember the family statistics, but he does know he was the sixth or seventh child and that he had from eleven to thirteen brothers and sisters. When the boy was eight his mother died, and three years later the Garands moved across the border, to Connecticut. After only one more year of schooling, John went to work as a floor sweeper and bobbin boy in one of New England's textile mills. There he spent every free minute in the machine-repair shop, watching the mechanics. The foreman liked the curly-headed

JOHN C. GARAND

little boy and let him earn a bit of extra money by smoothing roughnesses off spindles with a piece of building brick. Before his fourteenth birthday John Garand had taken out a patent on an invention of his, a new type of jack screw. Another invention was called for by the rifle he and his brother owned jointly: a sort of deflector target which sent the bullets skyward so they would not hit the neighboring farmers as they passed by.

By the time Garand was eighteen he was a machinist at the textile mill. One summer, too, he helped his father and brother run a shooting gallery in Norwich, but, says Teale, "their enthusiasm for target practice ate up most of the profits." After John moved to Providence, Rhode Island, to be near his new job in a tool factory, he took up motorcycling, and designed an engine with which he won a number of races at New England tracks. For several winters he gave his free time to fancy ice-skating, but his main interest was firearms.

After the outbreak of the First World War, Garand, then in his thirties, went to New York to work in a micrometer plant. At the same time he took correspondence courses, studying in the evenings. Every Saturday he spent at Coney Island, using the shooting galleries as laboratories for studying the rifles as he shot them. Once, when he had shot at every target in the amusement park in the course of the day, his gallery fees came to one hundred dollars. "Luckily for his bank balance," writes Teale, "he discovered a gallery near Times Square, about this time, where the proprietor would let him shoot free. Firing a rifle from the hip so accurately that he could hit a swinging target seven times on a single swing, he always attracted a crowd that overflowed onto the sidewalk and kept the cash register ringing at the gun counter. . . .One evening before he sat down to his lessons he read in a newspaper that the Government was having difficulty finding a satisfactory machine gun. He couldn't see why there should be any problem about that, so he sat down and designed a machine gun of his own."

Teale writes that Garand sent his plans to the Naval Board in Washington (another version has it that he merely wrote a letter to the War Department outlining his suggestions). At any rate, he was invited to the Capital to present his ideas in person. As a result, the officials offered to make him a master gauge and gun experimenter, annual salary eighteen hundred dollars, "turn him loose in a room at the Bureau of Standards, and let him prepare a model of his gun. The salary was just half of what he had been receiving as a skilled machinist, but he jumped at the chance. For eighteen months Garand buried himself in the room set aside for him. At the end of that time his gun was finished. But so was the World War, and the demand for machine guns was at a standstill."

Fortunately the Army was interested in developing a semiautomatic rifle that would combine the best features of a light machine gun and its famous bolt-operated Springfield rifle. In 1919 Garand was appointed as a consulting engineer at the United States Armory in Springfield, Massachusetts, which had turned out weapons for George Washington's army. Soon he began what was to be two decades of work on his rifle. Garand's basic design provided for expanding-gas pressure which would drive the bullet from its barrel, eject the empty shell, and throw the next cartridge into firing position. This not only made the firearm faster and easier to operate, but eliminated the Springfield's bruising kick after firing. He designed it, also, so that the user need touch only the wooden parts and not the heated metal. Garand's first rough model was submitted to the Bureau of Standards in 1923; but it was eleven years before his rifle was brought to a point where it met the Army standard in lightness, simplicity, and strength. The Ordnance Department held periodic competitions, at which designers submitted models of their guns. In 1929 Garand submitted one which, though too heavy, was "surprising." It enabled a man to fire eight times without taking his eyes from the target; it could be taken apart in the field within twelve seconds and reassembled with an ordinary cartridge as the only tool; it worked in heat or cold; and it could be fired successfully immediately after being immersed in water.

The inventor often felt that he could not possibly get his gas-operated rifle down to the required lightness. This was "in the back of Garand's mind night and day—when he was working, lying in bed, playing table tennis or badminton or pitching horseshoes. Often he came down to the Armory on week-ends," working over his plans in the deserted building, redesigning and again redesigning. He tried fifty different plans for the rear sight alone; and the final gun, according to Donald Wilhelm, contained nineteen different kinds of steel, worked out in consultation with metallurgists and machine-tool designers. To reduce the weight Garand had in most cases to reduce the number of parts. He eliminated an ounce here, a few grams there. Finally he designed one hammer spring that replaced five, saving a pound. In 1934, when the rifle was patented, it weighed nine and a quarter pounds, contained seventy-five parts—thirty-three fewer than the Springfield—and was "a precision instrument of rare ingenuity." The Army ordered eighty models for the "torture tests," which took months to produce, and Garand worked with both night and day shifts in the Armory model room, directing his eighteen workers and sleeping when he could.

In the tests, the Garand came out on top of a field of some fifty competing models. Then Chief of Staff Douglas MacArthur '41 changed the specifications from .276 caliber to .30, so its ammunition would be the same as for the Springfield and light machine guns, and again Garand redesigned his piece. Now at last he could have made a fortune in royalties—the Polish Government and a commercial munitions maker each offered him "literally millions"—but he chose to turn the patent over to the United States Government, royalty-free. He has the right to put the rifle into commercial production if the Army grants its permission, but he has never asked for it.

The next problem was to get the M-1, as the Ordnance Department termed it after it had been accepted in January 1936, into mass production. Fifteen hundred operations were required for this, and the Armory had to buy nearly a thousand different machines costing as much as twenty thousand dollars each, besides jigs and fixtures, writes Donald Wilhelm in *Forbes* Magazine. Later that year the first M-1's came off the assembly line, and the Infantry began to substitute them for the Springfields as fast as production permitted. After the rearming was well advanced the Marine Corps was under some pressure to make the Garand rifle also their official weapon. (Although the Marine Corps is under the Navy, its ordnance is supplied by the War Department, and it is naturally easier to supply one kind of rifle than two different ones.) The Garand did become the official Marine weapon in 1940, although the Corps' tests indicated that the arm, superior to any other semiautomatic rifle, was inferior to the Springfield in resistance to bad weather conditions. It was, however, three to three-and-a-half times as fast. Three million dollars were appropriated to supply the Marines with Garands, in addition to the Army's twenty-four million.

Gradually the complex operations required to produce Garands were cut down. In late 1940 the rifles were being turned out at the rate of seven hundred a day; in June 1941 the Springfield arsenal was producing a thousand a day: by August several factories were assembling them on a three-shift basis at more than one a minute, and more than a quarter-million had already been issued. Reporters who heard that this was the greatest advance in infantry arms since the beginning of the First World War had been amazed to find the inventor "an obscure civilian employee on the Government payroll at fifty-five hundred dollars a year—director of a staff of twenty men in the model room—who was bewildered by all the attention thrust upon him." "Did it ever occur to you," he was asked, "that the Garand rifle might kill a million men?" "I think," answered the designer, "that with this Government it will always be used for defense."

The Garand's value in that defense was proved when the Japanese attacked the Philippines in December 1941. General MacArthur praised the arm, and Garand was more pleased than surprised, for the Assistant Secretary of War had termed it the best shoulder rifle in the world, and several other generals had agreed. (In January 1945, General Patton '43 pronounced the M-1 "the greatest battle implement ever devised.") In March 1942, when the Japanese had captured some M-1's the weapon ceased to be a military secret. Garand estimated, however, that after individual models had been built it would take three years for a foreign power to put it in production. And he has continued to work out improvements, which have likewise been given to the United States Government, among them a new trigger mechanism patented in 1945 just before the Japanese surrender. According to General Marshall, America's chief advantages on the ground in the European war were the Garand semi-automatic rifle and multiple-drive motor equipment, principally the jeep and two-and-a-half-ton truck: "Our superiority in infantry fire-power, stemming from the use of the semi-automatic riflle, was never overcome."

Modest and reticent, John Garand does not discuss the various honors that have come to him. His four-line entry in *Who's Who in America* gives no biographical information except his receipt of the Holley Medal, which is given by the American Society of Mechanical Engineers to "one who, by some unique act of genius of an engineering nature, has accomplished a great and timely public benefit . . . meriting the highest honor within the gift of the mechanical engineering profession." (This award was made four days before Pearl Harbor.) Among his other awards is the medal of the Army Ordnance Association; in November 1943 he was one of three recipients of John Scott medals and premiums of one thousand dollars each awarded by the Philadelphia Board of City Trade; and in March 1944 he and the discoverer of radar, Dr. Albert Hoyt Taylor, received the first two Medals for Merit awarded to civilians for outstanding war services.

Garand is described as "alert, athletic, square-jawed," a short, dark-complexioned man with a mop of wavy black hair, and keen blue eyes framed by rimless eyeglasses. His speech shows traces of his French-Canadian origin, but he is a citizen of the United States, having taken the oath in 1920. The inventor is said to be an even better shot with a pistol than with one of his own rifles; "his idea of an exciting night's reading is to settle down in an armchair with a pile of machine-shop magazines beside him." Garand is puzzled when anyone unfamiliar with the customs of research workers suggests that he should have made money from his inventions instead of giving them away. His answer is that he has been able to support his wife and two children and has had "a lot of pleasure" out of his work. He does admit that he has never found time for the practicing necessary to make him a really good figure skater.

Who's Who in America, 1944-45

GASSER, HERBERT S(PENCER) July 5, 1888- Physiologist

Address: b. Rockefeller Institute for Medical Research, 66th St. and York Ave, New York City

DR. HERBERT S. GASSER

The director of the renowned Rockefeller Institute for Medical Research is Dr. Herbert S. Gasser, a physiologist of international fame. In 1944 he shared with Dr. Joseph Erlanger, head of the department of physiology at Washington University in St. Louis, the Nobel prize in medicine. The award was made for fundamental research in muscle-nerve physiology demonstrating the reaction of nerve fibers to electrical impulses. Through their work, machines recording brain waves have been improved to the point where the extent of certain types of brain damage can be detected, and the extent of the repair of damaged nerves can be measured. Someday, scientists have ventured, this work may lead to the detecting of thought.

Herbert Spencer Gasser was born on July 5, 1888, in Platteville, Wisconsin. His father, Dr. Herman Gasser, had come to America from his native Dorbirn, in the Austrian Tyrol, with his parents in 1866. The mother of the scientist, Jane Elizabeth (Griswold) Gasser, is of old New England stock. During his boyhood young Herbert played the piano and violin. He was adept at handicrafts, too—painting china and making miniature furniture—and later at the State Normal School in Platteville he invented various contrivances.

He was graduated from the University of Wisconsin in 1910 with the Bachelor's degree, and the next year, after receiving his Master's, he began the study of medicine at the university. There he had the good fortune to study under A. S. Loevenhart, the pharmacologist. The Professor was so impressed with his student's ability that he called him his "scientific heir" and bequeathed him a medal, with the request that it be passed on to Gasser's own best pupil. While a student at the university's medical school, Gasser was an assistant instructor in physiology, from 1911 to 1913. Walter J. Meek, professor of physiology at the university, wrote in a 1935 issue of the *Scientific Monthly* that physiology had attracted Gasser's profound interest, and during the period of his instructorship he began his research career. He completed his medical studies at Johns Hopkins, where he received an M.D. in 1915.

The year 1916 Gasser spent as an instructor in pharmacology at the University of Wisconsin. He then went to Washington University in St. Louis, Missouri, as an instructor in the department of physiology, of which Joseph Erlanger, the co-winner of the 1944 Nobel Prize, was head. Erlanger, some years Gasser's senior, is also an alumnus of Johns Hopkins and had gone to Washington University after serving on the faculty of the University of Wisconsin.

In the course of the First World War, Gasser did research in the field of traumatic or wound shock, studying its nature and treatment; before the war ended he also worked as a pharmacologist in the research division of the Chemical Warfare Service at the American University Experimental Station in Washington, D.C. (In 1941, in the Second World War, he was made a member of the National Research Commission.) On his return to Washington University in 1918 he was promoted to associate instructor in physiology and in 1920 to associate professor. In 1921, at the age of thirty-three, he was made head of the university's department of pharmacology. Soon after his appointment he was granted a two-year leave of absence for study in London, Paris, and Munich.

"At no time," says Professor Meek, "has Dr. Gasser ever divorced himself for one instant from his laboratory researches. They began in his student days and have constantly increased in significance, volume, and importance. His earliest work was on cardiac nerves, coagulation, mechanisms of oxidation in the living body, blood volume, and traumatic shock." His research into the problem of muscle-nerve physiology began in 1919 with Dr. H. Sidney Newcomer, with whom he succeeded in demonstrating the nature of the discharge from the nervous system into the diaphragm during inspiration. The next step in his research on the subject was made with Erlanger. Ten years before the two physiologists were awarded the Nobel Prize for their work in this field, they were known as outstanding electrophysiologists. Gasser, says Meek, was already an international figure—his contributions to "the development of the cathode ray oscillograph for physiological purposes, nerve conduction as related to diameter of fiber, the refractory period of nerves, the nature of nerve conduction, heat production, and viscosity in muscular contraction, the effects of rapidly repeated stimuli to nerves and cord potentials," were known to all students of muscle-nerve physiology before 1935.

Gasser's technique for the study of man's nervous system was interpreted for the layman by *Newsweek* in 1935, as follows: "Mystery cloaks the process by which primary sense organs react upon nerve fibers and flash impulses to the brain. What goes on in a stimulated nerve? Why do some fibers communicate only cold, others heat, others pain? How do we become aware of sensations? These problems, keys to the mechanism of thought, would remain scientific blind spots. But Dr. Gasser perfected an apparatus [the cathode ray oscillograph] delicate enough to register the infinitesimal electric currents set up by the stimulated nerve. . . .To gain his end, Dr. Gasser harnessed electrophysics to physiology. He discarded the usual heavy string galvanometer, too crude to catch the tiny electric impulses accurately. From radio, just out of its infancy, he borrowed new technique. He got the required voltage with a vacuum tube that amplified the nerve current. . . .Upon a photographic screen the beam flashed a precise picture of nerve reaction."

In 1931 Gasser was invited to head Cornell Medical College's physiological laboratories in New York City, and he was given a full professorship in physiology. During the four years he occupied the post Gasser's lecture hall was usually filled to capacity, and foreign scientists often came to New York to consult with him. When he left the laboratories in 1935 it was to accept what is perhaps one of the highest posts in the field of medical research, the directorship of the Rockefeller Institute for Medical Research. "At his hand," wrote *Newsweek* at the time, "lie inestimable opportunities to improve mankind's condition." To all corners of the world "he may send white-clad armies against fever and plague. His decisions, encyclicals of medicine, have behind them a master corps of researchers, the world's best laboratory equipment, and three million Rockefeller dollars a year."

A number of medical men had been surprised when Dr. Gasser, a physiologist, had been appointed to succeed the resigning Dr. Simon Flexner, a pathologist, and director of the Institute since its founding in 1903. "I am wondering why we started with an expert in pathology (the study of what causes disease), and now we have one in physiology (the study of how the body works)," commented John D. Rockefeller, Jr.'41, at a press interview after Gasser's appointment. "It is because we have to give more attention to the functions of the body," Gasser replied. "It is also because, in the last fifty years, in the field of conquest of infectious diseases, we have been very successful. . . . When one looks at the diseases that are decreasing and those that are increasing, one finds that those that are lethal because of deterioration of organs are increasing."

The announcement of the 1944 Nobel prizes in medicine was made from Stockholm in October 1944. In an interview Gasser said that he was surprised at the recognition given by the Nobel committee because "the device so far has had such limited practical application." In a *Science News Letter* he described the work as "a direct outgrowth of modern physics," which had made it possible through his development of the oscillograph to clarify "older observations and bring new ones to light." The future, he said, held "alluring prospects with respect to the unravelling of how the central nervous system works." As for the prize money, Gasser expressed his intention of devoting his share of the award (half of $29,500.07) to further research. "That was the spirit in which the money was given," he added, "and I think it would be a good way in which to spend it." The New York *Times* commented editorially that the year's prizes had been made "for determinations and measurements which demanded the finest equipment and finest skill. Such work is less spectacular than that which gave us the sulfa drugs and penicillin, but hardly less important."

In addition to the hundred or more papers Gasser himself has written, he has collaborated with Erlanger in *Electrical Signs of Nervous Activity* (1937), and is represented in *Symposium on the Synapse* (1939), which was published after a Toronto meeting of the American Physiologists Society, of which Gasser is an officer. He is a trustee of the Rockefeller Foundation, a Fellow of the American Association for the Advancement of Science, and a member of numerous scientific societies in the United States and abroad. He holds D.Sc. degrees from the University of Pennsylvania (1936) and the University of Wisconsin (1941), and LL.D. degrees from the University of Rochester (1940) and Washington University (1940).

The physiologist is a tall, slender man whose manner, his associates say, is modest and tactful. A bachelor, he lives in a New York City apartment, where one of his relaxations is playing the piano. Yachting and mountain climbing are his vacation pleasures.

GAUSS, CHRISTIAN (gous) Feb. 2, 1878-
University professor
Address: Princeton University, Princeton, N.J.

One of the most popular persons on the campus of Princeton University is said to be the former dean of the college, Christian Gauss, who has won a wide reputation for wit and wisdom. Long a professor of modern languages, a position he still retained when he terminated his twenty years as dean in 1945, he has written half a dozen books and many articles, ranging from advice to parents of college students in the *Saturday Evening Post* to scholarly discussions on modern languages, history, philosophy, and literary criticism. It

CHRISTIAN GAUSS

is small wonder that Princeton seniors once composed a song that hailed him with:

Here's to Gauss, called Christian,
A most encyclopedic man.

Born in Ann Arbor, Michigan, February 2, 1878, Christian Gauss is the son of Christian and Katherine (Bischoff) Gauss. He received his B.A. in 1898 from the University of Michigan, where he had been a distance runner. After taking his M.A. the following year, he taught Romance languages for two years at the same university. In 1901 he went to Lehigh University as assistant professor of modern languages. Called to Princeton University in 1905, when Woodrow Wilson was its president, he was appointed assistant professor of Romance languages, then raised to full professorship in modern languages two years later. In 1913 he became chairman of the department, a responsibility he was to hold until 1936. During this period Gauss lectured at the University of Cincinnati (1913), New York University (1915-16), and Columbia University Institute of Arts and Sciences, and was literary editor of the Princeton *Alumni Weekly* (1914-20). In 1914 Gauss received a Litt.D. from Washington, in 1928 an L.H.D. from Lehigh, and 1933 an LL.D. from the University of Michigan.

Gauss has devoted some of his time to translating, editing, and writing. Among his books are *Selections From Jean Jacques Rousseau* (1914), *The German Emperor As Shown in His Public Utterances* (1915), *Through College on Nothing a Year* (1915), *Democracy Today, an American Interpretation* (1917), and *Why We Went to War* (1918). Of the latter volume, the New York *Times* observed: "If there is still left in this country any sceptic pacifist who cavils at our entrance into the war he should read Mr. Gauss's calm, well-reasoned, and convincing book. He will find it remarkably comprehensive, so logically and forcefully presented, and so interestingly written that he will surely be compelled to surrender." A member of the editorial board of the *American Scholar* since its founding, Gauss is also associate editor of the *Journal of Education* and trustee of the Princeton University Press.

In 1925 Gauss began the practice of what he has humorously referred to as "an unhappy profession," for upon becoming dean of Princeton he was thus obliged to discipline young Princetonians for "offenses against a moral or social code not always entirely identical with their own." He continued his contact with them as professor, however, and as general supervisor of athletics; and when he resigned as dean of the college in 1945 he retained his position as teacher and chairman of the department of modern languages. (He was succeeded by Francis R. B. Godolphin.)

In his post as dean, Gauss drew upon his experience as campus father-confessor to discuss the problems and the life of the undergraduate as well as the errors of parents, in *Life in College* (1930). "If there is a wiser or kindlier dean of undergraduates anywhere than Dean Gauss of Princeton he has not yet written a book," commented the *Christian Century*. Wrote the *Saturday Review of Literature*: "This book is one of the few really good books on college life. First, because it is written not only by an expert, but by a sympathetic expert, and, secondly, because it rides no hobby. . . .It is a dignified, unexaggerated, and sincere presentation of the keen observations of an honest man." Gauss has continued these observations on college students in popular magazines, recognizing in 1935 the reorientation which was developing a socially minded college student who sought new standards of political and social thought.

In the list of the one hundred notable books of 1934 prepared by *New Republic*, Christian Gauss's *A Primer for Tomorrow* was listed as one of eleven notable volumes on philosophy and science. In this introduction to contemporary civilization, Gauss examined the modern spirit in order to explain the nature of events and the distinctive character of our culture, studying especially the effects of science, capitalism, and nationalism, and pointing to the decline of religion as a mark of national decay. The chief virtue of the educator's book, as of his others, is said to be its sanity. "Without any of the tricks manipulated by the journalist, Gauss is a lucid and attractive expositor," said the *American Review*. "His book may be commended to all who wish an unpartisan and mature guide to the modern mind and its imminent problems."

Much of Gauss's writing is done in the summer and after midnight. He once said that he had to write in self-defense, to reassure himself of his identity. "I was rapidly becoming a character in fiction," he says. "Day Edgar started it when he made me the dean in the stories *In Princeton Town* [1929]. Edmund Wilson '45 made it worse when he projected me as the professor in *I Thought of Daisy* [1929]. I became hopelessly confused when I was told that I was the comic-supplement dean in my old friend Edward Hope Coffey's *She Loves Me Not* [1933]. All this was very befuddling. Every now and then I have to write something and sign it with my own name to prove to myself that I am in my own person alive and kicking."

Christian Gauss has deplored the failure of American colleges to perceive the dangers of American nationalism and to "prepare the country for the ordeal it is now facing in common with other nations." As early as August 1933, writing in *Scribner's Magazine*, Gauss was among those who, recognizing the interdependence of nations, sounded a warning: "At a time when there are those who urge that we should carry our policy of nationalistic isolation farther than we have ever done in the past, we must bear in mind that in the past peace has not gone with faith in isolation and there is no guarantee that it will do so in the future. Quite the contrary. We cannot of course solve all of our problems at once, and those who prefer a continuing of, indeed even a stricter adherence to, the policy of nationalistic self-sufficiency must be warned that on this basis disarmament and the reduction of the risks of war are probably impossible. These can only be obtained by some form of international convention or union, which of course implies involvement."

To educate effectively for democracy, wrote Gauss in 1942, the colleges must impress upon their students that liberalism and nationalism do not go hand in hand, but are irreconcilably opposed to one another. There has been an "ever-increasing attempt to substitute the nation for mankind as the point of reference from which economic and political systems are to be judged."

This nationalistic spirit has had its impact on higher education, contends the educator. "In the past seventy-five years at an ever-accelerating rate we have been substituting the historical and the nationalistic standpoint for what may properly be called the humanistic or philosophical. No common human denominator is assumed to exist" in the humanities—languages and literature, the fine arts, music, philosophy, and history—since they are now studied with a chiefly analytical, historical approach. Although Gauss regretfully recognized that "the humanities are out for the duration" of the Second World War, he pointed out that "it will be a tragedy to allow this necessary diminution of college training in the liberal arts to be carried to reckless extremes," adding that "in time of war it is necessary that the secondary schools of a nation, even more than the colleges, take the long view of preparing those students whose abilities warrant, to become soundly and broadly educated men in a postwar world."

Gauss has served as honorary chairman of the American Association for a Democratic Germany, a group which proposed "to support and encourage democratic elements in Germany as a means of eradicating the danger of German aggression in Europe and the world." Gauss did not support Secretary of the Treasury Henry Morgenthau's '40 proposals for the reduction of Germany to an agricultural state. He holds that Germany's industry must be destroyed as a war measure, but that such action cannot make for a constructive peace. He urges "something constructive, creative," believing that wholesale wiping out of German industry would injure anti-Nazis as well as Nazis. He is now one of the co-sponsors of the re-formed Council for a Democratic Germany made up of former Germans, opponents of Nazism who came to the United States, whose unity in defining common objectives represents, the sponsors believe, a significant and encouraging development.

In addition to spending considerable time refusing offers of college presidencies, the educator's other activities have included membership in the executive committee of the National Committee for Democracy and Intellectual Freedom (1939-40), the senate of the United Chapters of Phi Beta Kappa, and the national committee of the American Civil Liberties Union. In 1935 Gauss was decorated by the Legion of Honor of France. Among his several enthusiasms are Vermont (where he owns a summer farmhouse), golf, bridge, baseball (both college and professional), and football. In 1902 he was married to the former Alice Hussey; their five children are Katherine, Dante, Christian, Natalie, and Hildegarde.

Who's Who in America, 1944-45

GAVIN, JAMES M(AURICE) (găv'ĭn) Mar. 22, 1907- United States Army officer

Address: c/o War Department, Washington, D. C.

"You are the pioneers of tomorrow's army." This statement of his belief in the importance and permanency of air-borne troops was the key sentence in the address Major General (then Colonel) James M. Gavin made to his regiment of paratroopers, the 505th Parachute Infantry, at the regiment's first battle-dress review, at Fort Benning, Georgia, in the fall of 1942. And it was General Gavin's command, the Eighty-second Air-borne Division, which, a little more than two years later, after playing an heroic part in repulsing the Germans in the December 1944 "Battle of the Bulge," won Field Marshal Montgomery's '42 tribute: "I take my hat off willingly to such men." Gavin's "All-American" Division, which General Sir Miles C. Dempsey '44 called the "best in the best Army in the world," was selected by the War Department to march in a four-mile parade in New York City, an event scheduled for January 12, 1946.

James Maurice Gavin is one of the youngest United States Army officers to command a division and probably the first parachute infantry officer to lead his division in combat. He was born in New York City on March 22, 1907, to Martin M. and Mary (Tearle) Gavin. His education was that of the average city boy—he went to the public schools, completing high school in 1924. Then, a week after his seventeenth birthday, he enlisted in the Coast Artillery Corps, in which, in the course of fifteen months, he served as private, private first class, and corporal with the Sixteenth and Second Coast Artillery regiments. On June 30, 1925, he received his appointment to the United States Military Academy.

After four years at West Point he was graduated on June 13, 1929, and was commissioned a second lieutenant in the Infantry. The twenty-two-year-old officer showed early an interest in aviation. In September 1929 he en-

MAJ. GEN. JAMES M. GAVIN

tered the Air Corps Primary Flying School at Brooks Field, Texas, where he remained until December. But he was not to use this training at that time, as he returned to an Infantry assignment with the Twenty-fifth Infantry at Camp Harry J. Jones, Douglas, Arizona, where he remained until September 1932. He then enrolled in the Infantry School, Fort Benning, Georgia, for an advanced course of military training, graduating in May 1933. He was next assigned to Fort Sill, Oklahoma, for duty with the Thirty-eighth Infantry, and was later transferred to the Twenty-ninth Infantry at the same post. Assuming the duties of a regimental plans and training officer in December of that year, he was promoted to first lieutenant the following November. Having requested foreign service he was transferred to the Fifty-seventh Infantry (Philippine Scouts) at Fort McKinley, remaining until October 1938. Upon returning to the United States he proceeded to Vancouver Barracks, Washington, for duty with the Seventh Infantry, serving with that unit until August 1940. While at this post Lieutenant Gavin received his captain's bars. After these varied assignments he returned to West Point, where he was instructor in tactics (1940-41).

With the threat of the Second World War drawing closer to the United States, the Army was experimenting at Fort Benning with a new type of soldier—the paratrooper. Anxious for an assignment which required daring to an unusual degree and offered him an opportunity to use his aviation training, Captain Gavin secured a transfer in September 1941 to the Provisional Parachute Group; then, after completing the course in "jump training," he became plans and training officer for the 505th Parachute Battalion, one of the first units of its kind in the United States Army. In October of that year he was promoted to the rank of major (temporary), and the following February, then a lieutenant colonel (temporary), he went to the Command and General Staff School, Fort Leavenworth, Kansas, to round out his training as a field officer. Upon the completion of this course he returned to the Air-borne Command at Fort Bragg, North Carolina, where he served as plans and training officer.

The parachute troops were now being expanded rapidly. No longer were they organized as battalions, but had become full regiments. The 505th Parachute Infantry was scheduled for organization and training at Fort Benning, and in August 1942 Lieutenant Colonel Gavin was given command. Under his guidance the regiment gradually grew from a handful of experienced officers and enlisted men to full strength. Requiring space for "jump training" and tactical exercises, the unit moved across the Chatahoochee River to the Alabama area of the post. There the men learned to jump with equipment and to hit the ground ready for combat. "Jumping is a poor means of transportation from the plane to the ground," he would often say to his men in an attempt to remove the false importance given to this phase of training over the greater importance of developing fighting ability as a military team. After the usual "growing pains" and the loss of several cadres to new units, the regiment completed preliminary training and "Ready"—the command given to paratroopers before the final word "Go" at which they leave the plane—was adopted as the motto for the regimental shield, a shield bearing a black panther emblazoned on silver.

Gavin was now a full colonel (temporary), a rank he had attained on September 25, 1942. His outfit had "come along" fast, and was transferred to Fort Bragg, where it became a part of the Eighty-second Air-borne Division. At this post the unit engaged in tactical exercises as part of a larger unit until January 1943, when it was given an unannounced overseas assignment. For the next six months its combat training exercises at Oudjda, one thousand miles west of Kairouan, North Africa, was a closely guarded military secret. At the edge of the Sahara Desert, living on canned rations, the division went through preparatory training on ground made to resemble the territory on which it was to fight in the approaching mission, the invasion of Sicily. As the day neared, a special feast was ordered by the commanding general, Major General Matthew B. Ridgeway, as a reward for the completion of rigorous training. Whole steers were roasted on spits, and the entire division had steak—a pound to a man.

The following night a combat team composed of infantry, artillery, engineers, and other branches of service dropped out of the sky upon enemy-held Sicily. "You will spearhead the landing of an American force upon the island of Sicily," had been their send-off order. In command of this hard-hitting force was Colonel Gavin. Under his direction the group was quickly organized after a hazardous landing in a high wind, and, although several groups had become separated, the larger part of the force got through to the objective, Viazza ridge. From this high ground they prevented the break-through of the Fifteenth German Panzer Division to the Gela-Vittoria road and its feeders, thereby ensuring the safe landing of the sea-borne forces which later struck the beaches of the south coast of the island on the morning of July 9, 1943.

This was not an easy accomplishment, for the Germans were equipped with Mark IV and the heavier Mark VI tanks. Against this array of strength the American combat team had three light parachute artillery pieces, and the potent bazooka. In Bunker Hill strategy the men were ordered to hold their fire until the last moment, making it more effective against the tanks. After breaking up several attacks they were finally reinforced with tanks and artillery from the beachhead. Their rear was now secure. The command to attack was given late in the afternoon of July 11, and they succeeded in driving the Germans from threatening positions on the flanks of the main American force. The next day the Germans had withdrawn and the beachhead was secured. Gavin, also in the action at San Margherita and Trapani, was awarded the Distinguished Service Cross and the Purple Heart for his services in Sicily.

After reorganization in Sicily the unit was called upon to reinforce the beachhead at Salerno, Italy, where the American forces were meeting with stiff opposition. This time the paratroopers were dropped behind their own lines, as reinforcements sharing in the victorious outcome of that bloody battle, which led to the capture of Naples and the advance to the Volturno River. They then dropped out of the news as quietly as they had dropped from the sky. Too valuable with their combat experience to be used as ground infantry, they were transferred to England, re-equipped, and trained for their most important mission, the invasion of Normandy.

Regretfully Colonel Gavin left his unit for a more important job. However, he did not leave the division, having taken over the task of assistant division commander of the Eighty-second in February 1944. In this capacity he took part in the landing on the French coast. In conjunction with the 101st Air-borne Division, the Eighty-second secured the causeways across the swamp lands of that shore, permitting the major forces to move quickly inland and mop up the Normandy peninsula.

In the Normandy invasion Gavin (made temporary brigadier general, September 1943) took part in the battles of Sainte-Mère-Eglise, Saint-Sauveur-le-Vicomte, and Hill 131. In this, his third major campaign, he added the Oak Leaf Cluster to his D.S.C. His fourth campaign was to take him into the Netherlands, where the Eighty-second Air-borne Division in conjunction with the 101st air-borne unit succeeded in making contact with the British ground forces and secured the Nijmegen bridge across the Waal (Rhine). A month prior to this, on August 15, 1944, Gavin became division commander of the Eighty-second after General Ridgeway had been promoted. In Holland, Gavin participated in the Grave, Mook, and Beek encounters before being sent into his fifth major campaign, the battle of the Belgian Bulge. Two days after the Germans' lunge into Belgium on December 16, the crack Eighty-second Air-borne Division made the first effort to blunt the German First Division's drive westward by going into action west of Saint Oumont. They were responsible for cutting off the vanguard of the First SS (Elite Guard) Panzer Division which attacked Habiemont on December 19 and later repulsed another attack by the Twelfth SS Panzer Division, which eliminated the threat to Liege, the primary objective of the Nazi spearhead.

Following this they went to the rescue of other American units which had been by-passed and surrounded. General Gavin's troops advanced so rapidly that they not only broke through to permit the withdrawal of the trapped units, but also outdistanced other American divisions which were attacking on their right and left flanks. The Eighty-second was ordered to withdraw by Field Marshal Sir Bernard L. Montgomery, who had taken command of the Allied forces on the north flank of the German salient. Objecting at first, they finally complied with the order when they were convinced that they could withdraw with honor. In January, after the division cracked the Siegfried Line, it moved into Cologne, then followed the Second Armored Division into Berlin.

Gavin substituted for General Parks as chairman of the Allied Kommandantur in Berlin while Parks made a thirty-day trip to Washington, and was instrumental, during this interim command, in canceling the censoring of sports news in the American sector. In midsummer 1945 the Eighty-second Air-borne Division was assigned to duty in the American zone of occupation. The men rolled into Berlin by train and jeep to relieve the Second Armored, except for ninety-nine "eager beavers" who had pledged themselves to "jump on Berlin"—in peace or war. At their special request they parachuted from transport planes, landing safely in nearby truck gardens. Later on, in the fall of 1945, the decision to disband the Eighty-second met with some disfavor. This was one of the proudest divisions of the United States Army—the division of Sergeant York, of General Wainwright, and of Lieutenant General John Lee—which had won distinction in both wars, matched by few other fighting units. Ironically, one of the reasons for liquidating it was that it had so many high-point men that it seemed simpler to disband it than to provide replacements. When its return to the States was scheduled for January 1946, New York City prepared to welcome it by what was predicted would be the biggest military parade since the end of the First World War. The Eighty-second was chosen for the victory parade, according to the War Department, because in the words of the New York *Times*, "it was felt that an air-borne unit emphasizes the versatility of the common soldier, the modern-age American foot soldier."

Major General Gavin's Eighty-second Air-borne Division was given Belgium's red fourragère military decoration on October 6, 1945, on the tenth received Holland's highest award, the orange cord of the Military Order of William, for its operations at Nijmegen the previous year. This is the second unit in Dutch history, and the first foreign unit ever to receive this honor. On the same occasion General Gavin was individually honored with the highest order which the Netherlands can confer, the Degree of Grand Officer with the Swords of the Order of Orange-Nassau. He is the first foreigner and the first person of non-royal blood to receive this order. Individual decorations were awarded to Gavin's men by the British, French, and Russian Gov-

GAVIN, JAMES M.—*Continued*

ernments, as well as three Congressional Medals of Honor, eighty Distinguished Service Crosses, nine hundred Silver Stars, fourteen hundred Bronze Stars, and ten thousand Purple Hearts.

While General Gavin speaks of himself as a comparatively uninteresting person, he cannot say too much or speak too highly of his pioneering paratroopers, whose training and combat technique are being studied by military experts everywhere: "The battle record of the Eighty-second is unique in our history for ground covered, losses sustained, continuous days in combat without relief, enemy killed, captured, and wounded, and over-all demonstrated eagerness and ability to destroy anything in the Wehrmacht." Gavin's coolness in jumping from planes was frequently the subject of comment among his men. Often, when he returned by plane from headquarters he would parachute to the ground rather than have the pilot land the plane. His quality of firmness is also well known. Any man under his command who did not "cut the mustard" was dropped from the unit. Tall and wiry Gavin, who looks more like a rugged Texan than a New Yorker, finds his chief peacetime recreation in athletics—tennis, handball, golf, and hunting. Married to Irma Margaret Baulair in September 1929, he has a daughter, Barbara Margaret.

GEIGER, ROY S(TANLEY) (gī'gẽr)

Jan. 25, 1885- United States Marine Corps officer

Address: b. c/o Navy Department, Washington, D.C.; h. Box 98, Route 4, Pensacola, Fla.

In June 1945 the Headquarters of the United States Marine Corps, Department of the Navy, announced the appointment of Lieutenant General Roy S. Geiger, as Commanding General of the Fleet Marine Force in the Pacific. From the bloody battles in the Solomons to the invasion of Japan two and a half years later, General Geiger had led his amphibious marines with skillful planning and daring tactical leadership both on land and in the air. His record as aviator, graduate of the highest military schools of both the Army and the Navy, and combat veteran of two wars made him a "triple threat" to the Japanese.

Roy Stanley Geiger was born in Middleburg, Florida, on January 25, 1885, to Marion Francis and Josephine (Prevatt) Geiger. As a youth he was bent on becoming a lawyer, and after attending Florida State Normal School in Deland for four years (1900-4) he completed his studies at John B. Stetson University, where he received his LL.B. in 1907. At this point in his life Geiger made a sudden change in his plans. He enlisted in the United States Marine Corps on November 2, 1907, and a year and three months later, on February 5, 1909, he was appointed second lieutenant.

With platoons, companies, battalions, and on through the "chain of command," Geiger gained experience, training, and promotions. In 1912 he served in the first Nicaraguan campaign and was awarded a medal. He also served in Cuba, Panama, the Philippines, China, and, following the First World War, in Haiti, and in the second Nicaraguan campaign, for which he received additional campaign awards.

When aviation had progressed far enough to become of military value, Geiger applied for training in flying. By 1916 he had completed the naval aviation course at Pensacola, Florida, becoming the fifth marine to receive his wings. With General Pershing in France, he flew on numerous bombing raids; and while serving with the First Marine Aviation Group he commanded Airplane Squadron No. 2, in recognition of which he was awarded the Navy Cross "for distinguished service in the line of his profession." (In 1916 he was married to Eunice Thompson; their two children are Joyce Renshaw and Roy Stanley.)

Returning from France, Geiger spent the 1920's as a military student and flier. He was graduated with distinction from the Command and General Staff School in 1925 and from the Army War College in 1929. In the interim he commanded aircraft squadrons in Haiti and at Quantico, Virginia. In 1930, when a hurricane struck Santo Domingo, Geiger was selected to pilot one of the three naval planes sent with medical supplies for the relief of the victims in that Republic. In April of the following year he flew on a similar mission to the victims of an earthquake at Managua, Nicaragua. In recognition of these flights he was awarded the Dominican Medal of Military Merit and the Nicaraguan Medal of Distinction.

The marine flier was appointed as Director of Aviation at Marine Corps Headquarters, where he served from 1931 until 1935. In 1940 Geiger completed the course of training at the Naval War College, and in 1941 the advanced course at the same school. He also attained his LL.D. in 1940 when he completed a postgraduate course in law. In May and June of 1941 he served as assistant naval attaché for air at the American Embassy in London and had an opportunity to observe the practical application of aviation in war. The following October he was appointed commanding general of the First Marine Aircraft Wing.

After Pearl Harbor and the first defeats the Americans suffered at the hands of the Japanese, the battle of Guadalcanal marked the turning point of the war in the Pacific. In the midst of this key campaign it was Major General Geiger who commanded the aviation units on that island from September 3, 1942 until November 4, 1942. Not content with commanding alone, Geiger proved to his airmen on one occasion that the much bombed airfield on the island was usable. Flying his own plane (at the age of fifty-seven) he took off with a 1,000-pound bomb which he dropped on a nearby Japanese headquarters, then returned to land his dive bomber on the pitted landing strip. During these operations the field was subjected to almost daily punishment, and on several occasions was the principal target for hostile naval gunfire and for harassment by shore-based artillery fire of the Japanese. Despite these conditions Geiger's men accounted for 286 enemy planes shot down, damage to a number estimated to be as great, destruction of twenty-three additional planes on the ground, the known sinking of six enemy ships including a heavy cruiser, the possible sinking of one other heavy cruiser and three destroyers, and damage to eighteen other ships. For his brilliant and daring leadership he was awarded a Gold Star in lieu of a second Navy Cross. "For extraordinary heroism and distinguished service . . . although personally endangered many times, [he] demonstrated a degree of fortitude and courage that served as an inspiration to all the officers and men under his command."

After Guadalcanal General Geiger was assigned to a tour of duty as Director, Marine Corps Aviation, and remained in that post until October 1943. He then returned to the fighting front which had shifted to Bougainville Island, where he succeeded Lieutenant General Alexander A. Vandegrift '43 as commander of the First Marine Amphibious Corps. From November 9 until December 15, 1943 Geiger pressed the attack. Despite difficult terrain, unfavorable weather, dense jungle, unhealthful climate, and fierce enemy resistance the First Corps seized and extended the important position on the west coast of Bougainville until necessary airfields could be constructed. "For exceptionally meritorious and distinguished service to the Government of the United States in a duty of great responsibility . . . due to his brilliant leadership, personal courage, and complete understanding of the task . . . skillful planning and daring tactical generalship displayed throughout this hazardous operation" Geiger was awarded the Distinguished Service Medal. A month and a half after marines had landed at Empress Augusta Bay, they were relieved by United States Army Forces under Lieutenant General Millard F. Harmon '42, December 15, 1943.

Elaborate preparations were under way to step up the tempo of the Pacific phase of the war. Two amphibious forces were organized. While one was engaged in a campaign the other was being supplied and trained for a new task. In July 1944 the two forces struck almost simultaneously, one against Tinian, while Major General Geiger led the other, the Third Marine Amphibious Corps, to Guam after the Americans had subjected that island to seventeen days of heavy bombing by carrier aircraft and a week of increasingly intensified shelling by all types of warship. By August 10 the island was secure. Signalizing the return of Guam to United States possession was the radio message received at Pearl Harbor, "This news is from Radio Guam. Nothing heard from you since 1941. Greetings." In a short time Guam became headquarters for the continued attack against Japan.

The following winter saw the consolidation of American gains in the Pacific, while Japanese island strongholds that had not been invaded were cut off from their supplies and rendered useless as a threat to continuing attacks by American forces. By the spring of 1945 an attack on the home islands of Japan was imminent; on the first of April the expected blow landed on Okinawa Island in the Ryukyu chain which extends south from the Japanese home islands. This was the largest amphibious assault in the Pacific, comprising the Tenth Army under Lieutenant General Simon Bolivar Buckner, Jr. '42, and supported by strong aerial and naval bombardment. Surprisingly, the initial resistance was light. The Twenty-fourth Army Corps after landing on the west coast of the island near the narrow waist in the middle pushed south against stiffening resistance. The Third Amphibious Marine Corps under General Geiger, who landed on the left of the Army Corps, drove north to secure the Ishikawa Isthmus, and found the going easy. As the favorable news continued to pour in on Geiger aboard ship, years seemed to drop from the General's shoulders and he grunted, "Looks good to poppa."

U. S. Marine Corps

LT. GEN. ROY S. GEIGER

The strategy of the Japanese was a withdrawal to the southern extremity of the island, and between Naha, Shuri, and Yonabaru they had prepared elaborate defenses which stopped the initial assaults of the Army troops. In the north Geiger's marines mopped up the major portion of the mountainous Okinawa, and several of the near-by smaller islands. Soon after the completion of the drive in the north the marines were transferred to the southern front where the drive had been stalled before Naha. In this battle of attrition casualties were high. In the battle for Sugar Loaf Hill the marines were forced to retreat six times before they finally held this key to Naha. The high cost in dead to the enemy proved their eventual undoing, and after being driven back from their final defense line, they showed signs of weakening. General Buckner in a surprise move brought the Eighth Marine regimental combat team into the lines on the night of June 17-18, for an assault which began at dawn. With the attack, pressure was brought to bear all along the line and by late afternoon the beaches were reached. In the moment of final victory, General Buckner was killed by artillery fire. Succeeding to the command, General Geiger continued the attack to ultimate victory, and remained as head of the Tenth Army until relieved by Lieutenant General Joseph W. Stilwell '42. General Geiger's

GEIGER, ROY S.—*Continued*

formal appointment to General Bruckner's command gave him the distinction of being the first marine ever officially to head an army. He had in previous Pacific campaigns led combined Army and Marine Corps forces, notably at Bougainville when he won his D.S.M., and again at Guam when he was awarded a Gold Star in lieu of a second D.S.M. Subsequently he was awarded another Gold Star in lieu of a third D.S.M. for the invasion of the Palau Islands in 1944. In June 1945 Major General Geiger was promoted to lieutenant general and appointed by the Navy Department to the post of commanding general of the Fleet Marine Force in the Pacific, to succeed Lieutenant General Holland M. Smith '45.

Sixty-year-old, white-haired, stockily built General Geiger is one of the toughest men in a force known for its toughness. It is said that there is little that he does not know about aviation, that he is one of the best qualified officers in all three services for amphibious operations. A stickler for discipline, he has the "greatest respect for authority—and the greatest for his subordinates." And many anecdotes are told of his calmness. "Once, leading a formation into the teeth of a fierce tornado, Geiger received a message from a nervous Navy pilot: 'What about the storm?' Geiger's reply: 'Well, what about it?'" Among the peacetime pursuits he enjoys are golf, swimming, and poker.

GEROW, LEONARD TOWNSEND (jĕ-rō′) July 13, 1888- United States Army officer

Address: b. c/o War Department, Washington, D.C.

The first commander of the United States Fifteenth Army, which went into action on the Western European front in March 1945 and for a time occupied the American zone of Germany, is known to his men as "General Gee," to his friends as Townsend, and to the newspapers as Lieutenant General Leonard T. Gerow. "Gerow" is a transliteration of Giraud, which was his Huguenot ancestors' name before they left France in the late sixteen-hundreds to escape religious persecution.

Leonard Townsend Gerow was born July 13, 1888, to Leonard Rodgers and Eloise (Saunders) Gerow in Petersburg, Virginia; it was probably to avoid confusion with his father's name that the boy was called Townsend. He attended Virginia Military Institute, the private "West Point of the South," which includes among its graduates Stonewall Jackson and the future Chief of Staff of the United States Army, George C. Marshall '40. When Townsend Gerow was graduated in 1911 as honor man (he had been class president), his younger brother Lee, also a future general, still had two more years to go. On his record, Townsend Gerow was appointed a second lieutenant of infantry in the United States Army that September, without examination.

Assigned to the Nineteenth Infantry Regiment at Fort Leavenworth, Kansas, Lieutenant Gerow began his service in January 1912, and accompanied his regiment to South Dakota, to Texas, and to Vera Cruz, Mexico. On his return to Texas, Gerow's work in the Galveston storm of August 1915 won him an official commendation. A year later he was promoted to first lieutenant and assigned to the Thirty-seventh Infantry, which got around in two years to five camps in Texas and one in New Mexico. Soon after the United States entered the First World War the Virginian was promoted to captain, and in April 1918 he sailed for France.

After two weeks of inspecting Signal Corps units in the field at Tours, Gerow was sent to Paris as assistant to the Signal Corps officer in charge of purchasing and disbursing, and soon became the officer in charge. Here he remained for the duration of the war, working with such "unusual ability and skill . . . tact, and energy," that he was rewarded with two temporary promotions, to major in June and lieutenant colonel in October; the Distinguished Service Medal; and the ribbon of a Chevalier of the French Legion of Honor. After the war the Colonel did equally well in disposing of the equipment he had purchased for the Army.

Returning to the United States in October 1919, Gerow spent a few days in the Office of the Chief Signal Officer. His next assignment was as commanding officer of the Signal Corps School at Fort Sam Houston, Texas. While there, on June 30, 1920, he reverted to his permanent rank of captain, and the following day was promoted to major. In February 1921 the future General was ordered to Washington for duty in the Office of the Chief of Infantry, and after two years became an assistant in the War Plans and Organization Section.

Leaving this post in September 1924, Gerow went to Fort Benning, Georgia, for the Infantry School's advanced course. Graduated in May 1925, he went right on to the Command and General Staff School in Kansas, from which he was graduated with honors in 1926. That August Major Gerow began a three-year tour of duty in the Office of the Assistant Secretary of War, as assistant executive officer. Then he enrolled at the Army War College, also in Washington, from which he was graduated in 1931. In addition to this highly advanced training, he took the field officer's course of the Chemical Warfare School at Edgewood Arsenal in Maryland, where he also served as assistant commandant.

After seven years behind various desks, Gerow was given a field assignment with the Thirty-first Infantry, serving in the Philippines and in the American Concession of Shanghai. The warring Japanese in China were inclined to be casual about respecting the rights of foreign nationals, but Gerow held them strictly to the letter of the law. In May 1934 he was appointed commander of Camp John Hay, in the Philippines, a post he held for seven months. In January 1935 he returned to the United States, and after completing an assignment at corps headquarters in

U.S. Army Signal Corps

LT. GEN. LEONARD TOWNSEND GEROW

San Francisco and Atlanta, he entered the War Plans Division of the War Department General Staff. This was in April 1935. That August Gerow was promoted to lieutenant colonel, his first advancement of rank in fifteen years—a record typical of the underbudgeted United States Army between wars.

In May 1936 Colonel Gerow was appointed executive officer of the War Plans Division, a post he held until March 1939. Next he helped to develop the Army's tactical doctrine, as chairman of a special board with headquarters at Fort Benning. For a time he was also chief of staff of the Second ("Indian Head") Division. In July 1939 the fifty-one-year-old Colonel Townsend Gerow was married for the second time, to Mary Louise Kennedy of St. Paul, Minnesota, where the Gerows now have their home. They have no children. (The Colonel's first wife had been the former Mrs. Kathryn G. Urquhart of New York City.) During the May 1940 "war games," designed to prepare the newly expanded Army for the war its leaders felt to be inevitable, he was senior control officer with the sixty-five-thousand-man Third Army as it "fought flood and storm" in western Louisiana.

Assigned to the Infantry School as chief of section, Gerow served also as assistant commandant. In September 1940 he was promoted to colonel, and a month later appointed brigadier general (temporary). He was, therefore, a general officer long before such well-regarded leaders as Generals George S. Patton '43, Mark W. Clark '42, Carl "Tooey" Spaatz '42, and "Ike" Eisenhower '42. After two months with the Eighth Division at Fort Jackson, South Carolina, General Gerow was appointed acting assistant chief of staff in December 1940, and assigned to duty as chief of the War Plans Division of the General Staff. (His brother was also attached to the General Staff at that time.) Months before Pearl Harbor, President Roosevelt '42 instructed the War Department to work out strategic plans for the United States in case it should be drawn into the Second World War; Gerow and his fellow officers labored long hours under high pressure to complete them.

Seventeen days after Pearl Harbor, Gerow was named assistant chief of staff, and continued to head the War Plans Division until February 1942, making "an invaluable contribution to our [United States] military effort through his foresight and sound planning." In a reorganization of the General Staff, Gerow was promoted to major general (temporary) and then replaced by a Brigadier General Dwight D. Eisenhower, who was described as "a recent associate of General Douglas MacArthur '41 in planning the defense of the Philippines." Gerow proceeded to Maryland to take command of the Twenty-ninth ("Blue and Gray") Infantry Division at Fort George Meade, Maryland. Here he was faced with serious shortages of personnel and equipment. ("You can't throw spitballs at the Germans and Japanese!" he is quoted as exclaiming on one occasion.) But with "tireless energy and rare acumen," Gerow "steadfastly held to his purpose of preparing his division for combat." The training was tough—Gerow believes in hard training to save lives—but morale was high. The General's work here and in the War Plans Division won him the Legion of Merit with the citation quoted above.

While the attention of the Western world was focused on the Mediterranean theater of war, General Gerow sailed for England, where he succeeded Brigadier General Russell P. Hartle as commander of United States field forces in the European theater. In July 1943 he was named commander of the Fifth Corps. At fifty-five he was one of the youngest generals appointed to a major command in the American ground forces. For eleven months Gerow displayed "great ability, energy, and initiative in the organization and training of the Fifth Corps for the amphibious assault on the European continent." Finally, on June 4, 1944, he embarked with his troops on Admiral Hall's amphibious flagship, which led the invasion fleet from Southampton to "Omaha Beach," the code name for the central Normandy beach on which Gerow was to land the first troops. "Next to Generals Eisenhower and Bradley '43," wrote correspondent Joseph Driscoll, "no American general on the Western front bore a heavier responsibility than Leonard Gerow. . . .One felt that he would be cool under any circumstances. He was a very quiet, unspectacular sort of person, with none of the color of a MacArthur or Patton.

"As commander of the Fifth Corps, it was Gerow's task to land the first troops on Omaha Beach and keep them moving toward Isigny and Carentan, the preliminary objectives. Nowadays [1945], when we have many corps on the Western front and scores of divisions, it is interesting to recall that Gerow had to accomplish his mission with two divisions [totaling perhaps twenty or thirty thousand men]." These were the famous old First Division, led by General Clarence Huebner, who had succeeded "Terrible Terry" Allen '43, and Gerow's old Twenty-ninth, led by General Charles H. Gerhardt. "General Huebner's First Division was to move in on the left," Driscoll continues, "and General Gerhardt's Twenty-ninth Division toward the right. The battle-tried First Division was handed the

GEROW, LEONARD TOWNSEND—*Continued*

tougher mission, while the inexperienced Twenty-ninth had some marshlands as a natural bulwark against the Germans if the latter counterattacked to drive the Americans back into the sea. As it turned out, the Germans failed to counterattack, and, moreover, the well-trained Twenty-ninth demonstrated that even without previous battle testing our troops are able to more than hold their own."

Says the citation for Gerow's Oak Leaf Cluster (awarded in lieu of a second D.S.M.): "On June 6, 1944, he brilliantly executed his plan of attack against the heavily fortified beaches, which were defended by strong and well-placed enemy forces. Under withering fire, sustained only by unlimited stamina and gallant leadership, his troops swept across the beach, overwhelming all opposition, and secured a firm lodgment from which further operations were launched." These further operations constituted the drive along the flooded, marshy Cherbourg peninsula, which Gerow planned and executed, and which made possible that city's liberation by the Seventh Corps under Major General J. Lawton Collins three weeks later.

General Gerow's First Army corps, in which the Second Division had also been identified, took part in the battle for Paris, along with Canadians, the famous French Second Armored Division, and the French Forces of the Interior. Gerow himself was the first American general to re-enter the capital, and was soon installed in Marshal Pétain's '40 old office, where he turned over military control of the city to French General Jacques-Philippe Leclerc '44. On August 25 he was present in the Montparnasse railroad station as Leclerc and German General Dietrich von Choltitz signed the Nazi garrison's unconditional surrender order, an hour before General de Gaulle '40 entered Paris in triumph. (The North American troops in Paris were tactfully bivouacked near the city gates, letting the Frenchmen have the glory.)

First Army units continued their advance, crossing the historic Maas (Meuse) River six days later and reaching Belgium on the first of September, freeing Sedan on the 7th and Luxembourg on the 10th, while its spearheads pushed into Germany and breached the Siegfried Line on the 15th. In early October 1944 the First Army began its attack on Aachen (Aix-la-Chapelle), which was defended from street to street and from house to house, and which was finally cleared of German soldiers on the 21st. By November, when General William H. Simpson's '45 new United States Ninth Army swung into line between Sir Miles Dempsey's '44 British Second and the American First Army of General Courtney Hodges '41, Bradley's successor, they were opposite the northern section of the Siegfried Line, north of Aachen.

The First and Ninth joined in the battle of the Cologne plain against a background of snow, quagmiry mud, and almost unceasing rain. The German radio called this battle for the industrial Ruhr and Saar valleys "the most terrible and most ferocious in the history of all wars," and the New York *Times* described it as "fighting of unprecedented heat. . .enormous pressure against utmost resistance. . . white-hot war of attrition eating into the strength of both sides." The First Army continued to push on grimly, operating south of the Ninth. It joined with the other Allied armies in the Ardennes sector to beat back the powerful German counteroffensive which opened December 16 and proceeded unchecked for twelve days to form the so-called "Belgian bulge" in the Allied lines. At the beginning of January 1945 the Americans launched their own counteroffensive, and on January 12 the Germans began the retreat from their hundred-square-mile salient.

In January the President nominated Leonard Townsend Gerow for temporary promotion to lieutenant general, which was approved in February; and in March SHAEF announced that he had been succeeded in command of the Fifth Corps by Huebner. "I would have gone with them to hell or Berlin, were they ordered," said Gerow; but the General was ordered instead to form a new army of American soldiers who had debarked in Europe "anywhere from several months to two or three days" earlier, and he told reporters that he would cut through red tape to do so. With the activation of this new Fifteenth Army, commentators pointed out, General Bradley had in his Twelfth Army Group more than a million combat troops, more than any general in modern history had ever had under one field command. The Fifteenth's existence was announced at ceremonies in which General Gerow and seven other American generals were decorated, he with the rosette of Commander of the French Legion of Honor. Bradley, Gerow, and corps commander Collins had previously been decorated by Russia for their part in the Normandy campaign. They saw some heavy fighting before V-E Day, after which SHAEF assigned them to the American sector of Germany as the Army of Occupation. There Gerow was lauded by the Fifteenth as a writer of "the most beautiful prose," when he issued the order: "Pull your GI's off K.P. duty. . . . Let your men sit at table and let the Germans wait on them." In July the Fifteenth Army Group turned its sector over to the French, leaving itself wtihout a job. General Gerow was named president general of a board of American officers appointed by General Eisenhower to make a detailed study of the whole European war, with headquarters in Washington.

Near the close of the year Gerow appeared before the Congressional Committee Investigating Pearl Harbor. As chief of the War Plans Division in 1941 it had been his responsibility to inquire into the Hawaiian defenses. Concerning this, he told the Committee, he accepted full blame for the failure to realize, in November 1941, that Hawaii was not fully alerted against Japanese attack. "If there is any responsibility in the War Department for failure to make inquiry [as to Major General Walter C. Short's defense preparations]I accept that responsibility."

Although stern, "serious and almost retiring," brown-haired Townsend Gerow is described as "a man of intense energy." For recreation he likes hunting, fishing, and an occasional inexpert game of golf after Episcopal services on Sunday. According to Gault MacGowan '45 in the New York *Sun*, Gerow "has even sped up his native Southern drawl"; he has "personality-plus as a leader" and "a quick expressive turn of phrase which quickly endeared him to his new command."

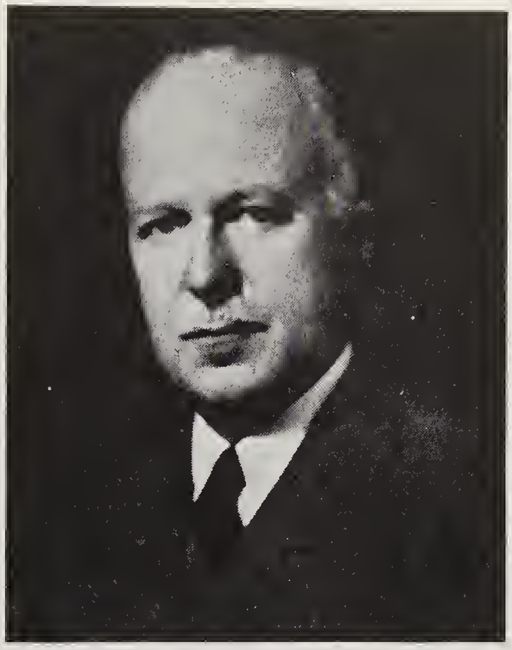
GIFFORD, WALTER S(HERMAN) Jan. 10, 1885- Corporation executive

Address: b. American Telephone and Telegraph Co., 195 Broadway, New York City; h. 111 E. 70th St., New York City

The American Telephone and Telegraph Company is the largest single corporate body in the entire world. Its stockholders number 680,000, and its investment is estimated at $5,400,000,000. Heading this giant enterprise is Walter S. Gifford, who became its president in 1925, when he was only forty years old.

Walter Sherman Gifford, the son of Nathan Poole and Harriet Maria (Spinney) Gifford, was born in Salem, Massachusetts, on January 10, 1885. As a boy he did not participate in rough, competitive games, but spent much of his time with books and his hobby of collecting butterflies. His collection was "the epitome of the boy, just as his subsequent attainments are the epitome of the man," a *Literary Digest* article once pointed out. He did not gather butterflies haphazardly, in the usual manner of boys. "He wanted only the best and rarest specimens." Each was mounted and classified with its Latin name, as well as its complete history, which the young collector memorized.

Walter Gifford was fifteen years old when he completed high school. At sixteen he was enrolled at Harvard, and he was graduated three years later with a B.A. degree. While mathematics did not interest him particularly, the career of engineering did appeal to him, but his parents were not in a position to make further study possible. Young Gifford was therefore obliged to seek employment at the age of nineteen. Convinced that individual talent would be recognized in a big corporation, where the most active business minds were centered, the youth wrote two letters of application for a position—one to General Electric Company and the other to the Western Electric Company. "At this point," states French Strother in *World's Work*, "sheer chance enters the story. By accident he [Gifford] put the letter addressed to the General Electric Company into the envelope addressed to Western Electric. . . .Possibly the oddity of the mistake caused his letters to get more than usual attention when they were read. In any event, he got an offer from the Western Electric Company, and accepted." The job was in the payroll department and the salary about ten dollars a week. Young Gifford forgot his earlier indifference to mathematics and applied himself to the study of figures. He was soon promoted to assistant secretary and assistant treasurer, a dual post he held for three years (1905-8).



WALTER S. GIFFORD

Not long thereafter the late Theodore N. Vail, then president of the Bell Telephone System of which Western Electric was a subsidiary, was greatly impressed by the graphic charts someone was using to supply information which he had requested from Western Electric. When it was brought to his attention that young Gifford was responsible for the organization of the facts, Vail offered him the newly created post of chief statistician of the American Telephone and Telegraph Company (of which the Bell System is a subsidiary). Vail had realized that here was not only "a device for preparing statistical information in a form of the utmost value to a busy executive," but also a capable young person with an original mind. Gifford spent the next five years (1911-16) as chief statistician in gathering facts for the use of the executives of A.T.& T. These facts were so presented that they were regarded as "essential to the decisions of questions of current management and of the problem of future expansion."

Early in 1916, when the First World War drew closer to America's shores, Gifford was called to Washington to become the supervising director of the Committee on Industrial Preparedness of the Naval Consulting Board. His task was "to prepare a statistical analysis of twenty-seven thousand manufacturing concerns whose facilities could be utilized in the national defense." The whole program was carried out with such skill that Gifford found himself with a new important assignment when the Council of National Defense was created

GIFFORD, WALTER S.—*Continued*

by Congress in December 1916. Gifford was made its director.

His task for the next two years was to assist in the subordination of productive enterprise "to the grand scheme of production of war materials." At the same time Congress authorized an advisory committee to the Defense Council, to which Gifford was also assigned as director. The Council itself consisted of Cabinet members, while the advisory committee consisted of representatives of industry and business generally. As the war drew closer, the Council created the Munitions Board on February 28, 1917. The following year, from July to September, Gifford represented the United States Government in Paris as secretary of the American section of the Inter-Allied Munitions Council. In October 1918 Vail wrote to Newton D. Baker, Secretary of War, requesting Gifford's release for the performance of urgently needed work for the telephone company. Gifford was accordingly released a month later, and upon his return to the A.T.& T. he was vice-president for four years, until 1923, when he became executive vice-president, serving for two years. In January 1925, a few days after his fortieth birthday, Gifford was elected the president of the American Telephone and Telegraph Company.

The famous "Telephone Investigation" by the Government was begun when Gifford had been president of the A.T.& T. about ten years. From time to time some Congressmen had suggested that the American Telephone and Telegraph Company, "the world's biggest monopoly," be investigated; but it was not until 1934, when the Federal Communications Commission was created, that Congress authorized a thoroughgoing study of the company. In his work *American Tel & Tel* (1939), Horace Coon summarizes the investigation: "Telephone officials say that the investigators were looking for loot and found none. Probably no corporation was ever asked so many questions by Government inquirers as was the A.T. & T. The company's files and correspondence were examined and significant portions quoted at length in the seventy-seven staff reports. The investigation was said to have cost the Government $2,000,000 and the A.T. & T. $1,500,000." A preliminary report, by Paul A. Walker, was made public in April 1938, and his final report was issued about a year later. (The first report was not subscribed to by other members of the FCC. All members, however, approved the final report, which was then sent to Congress with recommendations for future regulation of the telephone industry.) "The A.T. & T. answered Mr. Walker's report with a 'Brief,' giving its reasons why the proposed report should not be adopted. However, it was accepted in principle and in substance." There were several general points of attack made by Walker. He criticized the company's methods of figuring depreciation, asserted that the telephone rates could be reduced without interfering with the standard of service, that the company had evaded effective State regulation, and that it was "treated as a unit for purposes of profit, and as a group of separate corporate entities for purposes of regulation."

Gifford replied that the investigation had been one-sided from the start: "We were denied not only the right to cross-examine investigation witnesses and to be heard in our own behalf, but also we were denied the right to have included in the record written material which we had prepared and considered necessary to point out serious and important errors affecting most of the investigators' reports. It became obvious that the telephone company's side of the story had not been told in the Walker report, and it became equally clear that the telephone company's story must be given thorough and fair-minded consideration in any discussion of the Walker criticisms."

In the preface to his book *A.T. & T.* (1939), N. R. Danielian replied to Gifford's criticism by pointing out that a Congressional investigation does not include a legal right of cross-examination. While two reviewers considered Danielian's work a penetrating study, another critic found it too full of biases to be favorably compared with Ida Tarbell's "poised and objective study" of the Standard Oil Company. Coon's book was judged not so scholarly as Danielian's, and its neutrality was both praised and condemned.

When war again threatened the United States, in 1939 Gifford became a member of the War Resources Board; and in 1941 he was made chairman of the Industry Advisory Committee of the Board of War Communications and a member of the executive committee of the New York State War Savings Commission. Active in the War Loan drives, he has also served as national chairman of the American Red Cross War Fund campaign. He heads the board of directors of the Greater New York Fund, which raised more than four and one-half million dollars in 1944, and he is chairman of the board of the Community Service Society, the largest private family welfare agency in the United States.

The Second World War greatly curtailed the expansion of the telephone company's installations for civilian needs: in the fall of 1944 Gifford announced that only one-third of the demands could be filled. In 1944, too, organized labor, for the first time in corporate history, made an attempt at the annual meeting of A. T. & T. stockholders to obtain direct representation on the company's board of directors. The attempt failed and union representatives' resolutions asking for revision of the pension system and for a halt of the sale of telegraph equipment to the Western Union Telegraph Company were voted down. The year before, on January 20, 1943, A.T. & T. agreed to lower its long distance telephone rate and to reduce its long line revenues by more than fifty million dollars per year.

The telephone executive has occupied a number of governmental posts during peacetime. In the winter of 1931-32 he directed President Hoover's '43 Organization on Unemployment Relief. He was a member of the Banking and Industrial Committee of the Second Federal Reserve District (1932), and of the Business Advisory Council for the Department of Commerce (1933-35). He has several business interests outside of A.T. & T. During the years from 1929 to 1939 Gifford was a member of the board of directors of the United States Steel Corporation, and he is also a director of the First National Bank of New York.

Numerous educational and philanthropic bodies engage Gifford's attention, too. In the first group, he is trustee of the New York School of Social Work, Johns Hopkins University, Cooper Union, General Education Board, Rockefeller Foundation, and the Carnegie Institution of Washington, D. C., and an overseer of Harvard University. In addition he is chairman of the lay council of the New York Academy of Medicine. Several universities have bestowed honorary degrees upon Gifford: Williams College an LL.D. in 1928: Colgate College the same degree in 1929; Oberlin College a D.Sc. in 1929; Union College a D.C.L. in 1939. He is a Fellow of the American Association for the Advancement of Science and of the American Statistical Association; a Gold Medalist of the National Institute of Social Science; and the third person to receive the Vermilye Medal of the Franklin Institute (1943), awarded every two years to a notable exponent of industrial management. In the fall of 1944 he announced that his own company had established a trust fund to finance five annual post-doctorate fellowships in physical science, the awards to be known as the Frank B. Jewett fellowships in honor of the president of the National Academy of Sciences and vice-president of A.T. & T.

A few magazine articles have been written by Gifford: "Does Business Want Scholars" (1928), "Pensions, Charity, and Old Age" (1930), "Can Prosperity Be Managed" (1930). In the second he set forth his objections to state old-age pensions; and a few years later, with the advent of the New Deal, he opposed the projected Communications Bill, holding that it would mean Government management rather than Government regulation of the country's communication services. A considerably modified Bill was finally passed. A champion of free enterprise, he has declared that it was the "basic privilege" upon which other freedoms would depend in the postwar era.

Gifford is described as "largish and strong;" in complexion sandy, hair thinning and graying; and he wears a small mustache. In 1916 he was married to Florence Pitman, now deceased. Their eldest son, Walter Sherman, a naval officer, was killed in the South Pacific in the summer of 1944. Another son, Richard Pitman, was also on active duty in the Navy during the war. On December 22, 1944, Gifford was married to Mrs. Augustine Lloyd Perry.

GILDER, ROSAMOND Magazine editor; drama critic

Address: b. Theatre Arts, 130 W. 56th St., New York City; h. 24 Gramercy Park, New York City

Rosamond Gilder, the editor of *Theatre Arts*, "the international magazine of the theater," has devoted most of her adult life to writing about the theater and its people. Her articles, described as "scholarly, meticulous, and faintly romantic," have been an important part of the magazine for nearly twenty years; and one of her books, *John Gielgud's Hamlet*, has been recommended to all teachers and future producers of Shakespeare.

Vandamm Studio
ROSAMOND GILDER

Born at her family's summer home in Marion, Massachusetts, Rosamond Gilder has lived in New York City all her life. Her father, Richard Watson Gilder, poet and editor, had begun his long editorial career in 1870 when he joined the staff of *Scribner's* as associate editor. When the magazine became the *Century* in 1881, he continued as editor, a post he held until his death in 1909. Miss Gilder's mother, Helena (de Kay) Gilder, was an artist and one of New York's best-known hostesses during the nineties. The child received a rich cultural heritage from others in her family, too, for her father's sister, Jeanette Leonard Gilder, was co-founder of the *Critic* and its editor from 1881 to 1906; and her uncles, William Henry Gilder and Joseph B. Gilder were well-known journalists.

In their home on East Eighth Street, the Gilders entertained the outstanding artists and literary figures of the day. With such notables as Walt Whitman, Henry James, Paderewski, and Eleanora Duse as Friday evening guests, the five Gilder children, of whom Rosamond was the youngest, grew up in a stimulating atmosphere. On the other hand, the girl's early formal education did not completely follow the pattern expected of the daughter of one in the Gilder's social position, for she received her first schooling at Public School No. 41. From there, however, she went to the fashionable Brearley day school, where she attended classes for two years. She was then forced to end her school days because of ill health, although she was graduated with her class. She and her family had withdrawn from the social limelight following Richard Gilder's death, but soon afterward Rosamond herself, enlisting the aid of her older sisters, began to entertain young

GILDER, ROSAMOND—*Continued*

people at Sunday night dances in the Gramercy Park apartment to which the Gilders had moved before the editor died.

In 1916 Miss Gilder made her first appearance in print, with a biography of her father which she had begun shortly after his death. The volume consists of a collection of Gilder's letters, for which his daughter had supplied the continuity. A year later, when the United States entered the war, she was on her way to France on a three-month assignment as confidential secretary to William Palmer Lucas, head of the Children's Bureau of the Red Cross. (Mrs. Lucas had been Miss Gilder's history teacher at Brearley.) Although her only qualification for the position was her knowledge of French, Miss Gilder remained in Paris for two years as executive secretary of the bureau. For her services the French Government awarded her the Médaille de Reconnaissance and the Médaille d'Epidemie.

Miss Gilder's first literary attempt after she returned from France was a translation of *My Life,* the autobiography of Emma Calvé. It was serialized in the *Saturday Evening Post* in 1922, and that same year the translation was published in book form. Two years later, in 1924, Miss Gilder went to work for *Theatre Arts Monthly* as a proofreader, substituting for a friend who was ill with the mumps. *Theatre Arts Monthly* had been established by Sheldon Cheney in Detroit in August 1916. When its office was moved to New York less than two years later, the magazine was without funds, but its purposes—"to represent all of the arts that go to the making of real theater" and to become "doubly international, in its content and subscribers"—were firmly established in the minds of its editors, who believed the theater to be "not only the most democratic, but the most international and illuminating of all arts." Miss Gilder's temporary position lengthened into twenty-one years of service as associate editor, in which capacity she wrote articles on all phases of the theater. (Edith J. R. Isaacs undertook the conduct of the magazine upon its removal to New York and has been its editor and publisher ever since.)

During the years 1932 through 1935 Miss Gilder was actively interested in the development of the little theater movement, giving much of her time to her duties as editorial secretary of the National Theater Conference. In 1935, when this organization became the basis for Hallie Flanagan's Federal Theater Plan, Miss Gilder left *Theatre Arts Monthly* to work on the Government project. After six months as director of the Bureau of Research and Publication (the Playwright's Bureau), she resigned from her WPA job. Returning to *Theatre Arts Monthly,* she resumed her position as associate editor. In 1938, upon the illness of Mrs. Isaacs, Miss Gilder assumed the additional responsibilities of drama critic, for which her apprenticeship years had prepared her. Her approach to the stage has been analyzed as scholarly. She evaluates a play on the basis of how it accomplishes its purposes, giving her readers an understanding of the play rather than a dogmatic opinion. Finally, in 1945, she became editor in chief of *Theatre Arts.* (In November 1939 the "Monthly" was dropped from the title.)

Besides reviewing plays, Miss Gilder has written many articles for the magazine on the theater, its personalities, history, and achievements. "La Nostalgilder, Some Letters of Eleanora Duse" appeared in *Theatre Arts* in 1926. The letters were written by the famous actress to Miss Gilder's mother, and in them La Duse used the word "nostalgilder," which she had coined to describe her feelings when she was separated from the Gilders. Some of Miss Gilder's other articles are "The American Theatre, 1916-1941," a brief history of the theater which she wrote for the twenty-fifth anniversary edition of the magazine; "The Fabulous Hart"; "The Federal Theatre, a Record," which was based on her experience with that agency; "Joseph Jefferson," a discussion of the noted portrayer of Rip Van Winkle; "Musical Comedy Between the Wars," an evaluation of that type of production; "An International Theatre: Made in America"; and "Theatre in the War Years."

The editor-critic's writing has not been limited to articles for *Theatre Arts,* although she remains within her main sphere of interests. Her book *Enter the Actress, First Women in the Theatre,* which was published in 1931, is composed of biographical sketches. The book is also a history of the part women have taken in the development of the dramatic art, for Miss Gilder highlights those women who have been innovators in their fields, tracing them as far back as Hrotsvitha, a tenth century nun credited with being the first feminine playwright. Miss Gilder was criticized by some for the omission of one or two actresses, but all critics agreed that the book was a valuable addition to the theatrical library. Her next two books were bibliographies published by Theatre Arts, Inc., which issues only those books considered essential to the field: *A Theatre Library, a Bibliography of One Hundred Books Relating to the Theatre* was published in 1932, and *Theatre Collections in Libraries and Museums, an International Handbook,* on which Miss Gilder collaborated with George Freedley, came out in 1936.

A year later Miss Gilder's *John Gielgud's Hamlet, a Record of Performance* appeared. The book includes the version of the play which Gielgud used and a description of every speech and movement made by the actor during the performance. It also includes some of Gielgud's notes on costumes, scenery, and stage business. In order to achieve what the critics considered a complete and invaluable record, Miss Gilder saw Gielgud's portrayal of Hamlet more than thirty times. During an interview with the actor she accepted his prompt book, but refused his offer of his personal notes on the characterization, because she felt that her study should be made entirely from the point of view of the audience.

Miss Gilder's activities, exclusive of *Theatre Arts,* have included her service as secretary to the American National Theatre and Academy, and to the New York Drama Critics Circle, of which she was once the only woman member. She has been a member of the board of governors of the Cosmopolitan Club (to which she still belongs) from 1925 through 1933, and president during the year 1932-33. She has overcome a phobia for public speaking, and her conversation is described as brilliant and witty, "but never at the expense of true scholarship. She is serious but not unduly academic; she has wit but no wisecracks. Her attack is so open and so gay that it is difficult to realize that she is really a shy person."

Five feet two inches tall, with brown hair and eyes, Miss Gilder has never allowed any ill health to interfere with her career as it did with her education. She budgets her strength carefully, seeming all the while to have much energy. She still lives at the Gramercy Park address (in a smaller apartment), where she entertains in the Gilder tradition, even borrowing the old apartment from her sister when the parties are too large for her own limited space. Her nieces and nephews are given the privilege of helping at many of her parties. She satisfies her love for gardening and sunbathing at the family farm in Tyringham, Massachusetts, and, although she professes to dislike writing, she spends five hours a day working at it even in the country.

GOOSSENS, EUGENE (gōō's'nz) May 26, 1893- Conductor; composer; violinist
Address: b. American Bldg., Cincinnati, Ohio

Eugene Goossens, conductor of the Cincinnati Symphony Orchestra, is not only one of the world's most important conductors, but a violinist, and a composer of note—"a musical personality of international repute." In England, his native land, he is considered "the bright and particular star of English contemporary composers," and since coming to America in 1923 he has not only succeeded in sustaining his Continental reputation, but has established himself securely in the "American way." He has entered wholeheartedly into the cause of the American composer, and has shown a special interest in the musical education of the younger generation.

One could scarcely picture Eugene Goossens as anything but an artist, for his father and his grandfather before him were well known conductors; thus, it is not surprising that as the most brilliant of the three he should possess an unusual array of musical gifts. He was born in London on May 26, 1893, of Belgian ancestry. Eugène seems to have been a favorite family name, since his father and his father's father bore the same name. Both were widely known in European musical circles and at different periods held the position of conductor with the Carl Rosa Opera Company. His grandfather conducted the first performance in England of Wagner's *Tannhäuser.* Goossens' mother also had something to contribute to his genius, for she was the former Annie Cook, daughter of Aynsley Cook, the operatic basso. In his immediate family the gift of musicianship was not confined to Eugene, for his younger brother Leon is a world-famous oboist, and two of his sisters play the harp, Marie being a member of the Royal Philharmonic Orchestra. His brother Adolphe also became a well known musician.

EUGENE GOOSSENS

Eugene Goossens began his musical education at the Bruges Conservatoire. Later he entered the Liverpool College of Music, where in 1907 he won the scholarship that brought him to the Royal College of Music in London. Here he continued his studies—the violin under Serge Rivarde, composition with Sir Charles Stanford—graduating in 1911. The young musician began his professional career as a violinist with the Queen's Hall Orchestra, under the baton of Sir Henry Wood.

Goossens' progress from the violinist's chair to the podium was rapid, and it was not long before he was conducting regularly at the Drury Lane and Aldwych theaters, and in the provinces. He was now also composing prolifically. Once a year for a number of years he conducted one of his own compositions with the Queen's Hall Orchestra, and it is apparent that the first big opportunity of his career stemmed from the success of these performances. In 1915 he was invited by Sir Thomas Beecham to conduct a performance of Sir Charles Villiers Stanford's opera *The Critic*, an engagement which he fulfilled so well that he was chosen Sir Thomas' assistant, a position which he held until 1920. At the same time he became a familiar figure in Continental musical circles, accepting many invitations to conduct leading European orchestras. During this period he also conducted the Handel Society in London and the Royal Choral Society, at that time the largest choral society in England. From 1919 to 1923 he directed the Symphony Orchestra of the Diaghilev Ballet. In one of

GOOSSENS, EUGENE—*Continued*

those years (1921) he organized his own orchestra and gave concerts devoted to modern music, and in 1922 he conducted the Russian Ballet and opera performances at Covent Garden. "His work showed such remarkable musical insight and interpretive talent," writes David Ewen, "that he immediately impressed the English music world as a conductor of the first importance."

Goossens' reputation had preceded him to America. On his arrival in 1923 as conductor of the Rochester Philharmonic Orchestra, on the invitation of the Eastman School of Music (the parent body), he was commissioned by the Berkshire Festival authorities to write a string sextet. He remained for eight years in his Rochester post and was active also as a member of the faculty of the Eastman School of Music, teaching a class in conducting. He left Rochester in 1931 to succeed Fritz Reiner '41 as conductor of the Cincinnati Symphony Orchestra, a position which he still holds.

Goossens' activities in Cincinnati are not confined to the regular concerts of the Cincinnati orchestra, for the Cincinnati Orchestral Association Company also sponsors a series of young people's concerts, which include performances of opera. The leading roles in these operas, conducted by Goossens, have usually been sung by members of the Metropolitan Opera Company, supported by the Cincinnati Symphony Chorus. Whenever possible, the operas have been sung in English to increase their appeal to the music appreciation classes in the local schools.

Since coming to America Goossens has appeared as guest conductor with leading orchestras in the United States, including the Philadelphia, San Francisco, and Boston symphony orchestras, and the New York Philharmonic, with which he was a guest conductor during its centennial season in 1941. It was in that same year that he made his debut at New York's Lewisohn Stadium, with Mischa Elman as soloist. This was the first of a series of ten concerts for which he had been engaged.

It is interesting to note that Goossens, whose opinion of American composition up to this point had not been especially favorable, after careful scrutiny of many American scores composed over a period of years, selected five for inclusion in his Stadium concerts. His own words appearing in the New York *Times* of June 29, 1941, convey his attitude toward the rapid development of musical composition in America: "For how many years have we conductors prayed for a Grant Wood '40, a Steinbeck '40, or an O'Neill of American music? Our prayers are finally being answered. Imagine ten years ago my including five American works in a group of ten concerts, as I am doing in my series . . . at the Lewisohn Stadium!"

In an article in *Musician* of December 1927, Goossens has given his own analysis of the conducting art: "Conducting depends first and foremost on something that cannot be taught, an innate capacity to inspire players with personal thought and feeling," he writes. "Great conductors like Richter and Nikisch, under whose batons I played in early days, were not only superb musicians, but brought to their work a personality not to be acquired through teaching." According to more than one authority, Goossens himself possesses to a large degree this power to inspire his musicians.

A. Eagleford Hull has summarized Goossens' conducting art in a brief sentence: "For keenness, enthusiasm, sensitiveness, and sweet sanity, he is unsurpassed." Following Goossens' New York debut in 1926, Olin Downes '43 pronounced him "a definite personality" with "contagious enthusiasm." And he said, in referring to his reading of Stravinsky's '40 *Le Sacre du Printemps*, "He gave one of the clearest and most broadly effective interpretations of the score that has been heard here. . . .It was this performance that promised in him a new arrival with something of his own to say."

As a composer Eugene Goossens also ranks high, being considered one of the leaders of the contemporary British school. He has created music in every form, including opera, ballet, concerto, symphony, choral, and the various forms of chamber music. Ranking high among his compositions are his operas, *Judith* (1925) and *Don Juan de Mañara.* The latter was composed and given its first London performance in 1937, with Lawrence Tibbett '45 in the title role. (The libretto for this opera was written by Arnold Bennett.) *Newsweek*'s account of the première of the opera stated that Tibbett, "as the murdering, seducing, miracle-instigating Don . . . had to do some vocal gymnastics among Goossens' chromatic pitfalls and ever-changing rhythms. . . .In many instances he [Goossens] employed the human voice almost as if it were one of the musical instruments." Of the opera *Judith,* conceded by the majority of critics to represent Goossens' best work. Percy Grainger has said, "An amazing compositional and orchestral virtuosity pervades the score of *Judith.* Only a keen, vigorous mind could have conceived this music; in the main somewhat unbending in its extreme austerity and preciseness, though flowering forth occasionally into brief moments of luscious sensuousness."

In another analysis of Goossens as a composer, Oscar Thompson, in *Music and Musicians,* has written, "In his instrumental music, both for orchestra and for chamber combinations, he shows experimental tendencies united to a constant desire for formal perfection along semiclassical lines. There is also a marked element of humor in some of his music. His idiom is predominantly chromatic." Hull says that the best way to get acquainted with Goossens' music is through his piano pieces. The four contributions which "roughly correspond to the chief phases of his musical evolution are *Concert Study* (1915), the brilliant legerdemain stage; *Kaleidoscope* (1917-18), the French phase; *Nature Poems* (1919), the Stravinskian phase; and *Hommage à Debussy* (1920), a postimpressionist admiration of the great leader of French musical impressionism." Hull continues: "A love of other arts besides his own special one has kept him keenly alive to modern movements, and a genial and generous nature has enabled him to make the best of his operatic and orchestral experience in this much underrated land of ours, where others would have succumbed."

In criticism of the first New York performance (1941) of Goossens' Symphony No. 1, Opus 58, Olin Downes commented: "While his harmony is modern, and while his orchestration, formal procedure, and all that, can be described by the same term, the symphony is actually old-fashioned, conventional in spite of its advanced style, and not individual in invention." F. Bonavia, reviewing the first London performance of this work during the Promenade concert season two years later, wrote for the New York *Times*: "Perhaps the most ambitious of contemporary English works was the Symphony No. 1 of Eugene Goossens, whose performance had aroused expectations in those who remember his early essays and the hopes that their promise had kindled. Unfortunately the new symphony . . . aroused hopes only to disappoint them. His musicianship is never in question. He is a master of modern methods; his form, his color, his ingenious harmonic combinations proclaim great abilities, and his sense of rhythm is infinitely more intriguing than that of the composer who spends his time in whittling and dividing minute subdivisions. . . .What is missing . . . is the great theme, 'the *idée mère.*' "

In *Composers of Today* David Ewen comments on the reception which Goossens' earliest compositions received. The composer's "unorthodox style—his confusing rhythms, his sharp-pointed dissonances, and his strange melodic lines—puzzled the audience, but there were a few who could recognize the talent that flashed through these early works [two trios performed in the First World War period]. Since coming to this country [the United States] Goossens . . . has asserted himself as one of the most brilliant of modern English composers." The conductor-composer has made several wax transcriptions for posterity. Among these are his interpretation of Ravel's *Le Gibet* and the "Danse" from Debussy's two-piano suite *En blanc et noir*. Among the more important recordings of his own works is the ballet music from the opera *Judith*.

Eugene Goossens is deeply interested in the development of music among children, as evidenced by his frequent appearance with children's choruses. In an article by him appearing in November 1928 in the *Musician*, he said, "There is every reason to hope much from the reaction of children to music—indeed from the reaction of the child to all beauty and art, provided this contact is not subject to too much disciplinary interference."

In the summer of 1942, desiring to do something for the war effort, Goossens wrote to twenty-six composers asking for instrumental flourishes known as "fanfares," in which the spirit of the times would be represented. Nineteen responded. Six of the commissioned fanfares—those by Morton Gould, Henry Cowell, Paul Creston, Felix Borowski, Leo Sowerby, and Goossens himself (his *Fanfare for the Merchant Marine*)—were played by the National Broadcasting Company Orchestra in six weekly broadcasts of *Music at War*.

"Last summer," wrote the New York *Times* in March 1945, "when surveying the possibilities of new music for the fiftieth anniversary Jubilee season of the [Cincinnati Symphony] Orchestra, Mr. Goossens hit on the idea of submitting to several composers a theme, which he himself wrote, and asking each to write a variation on it. . . .He also sent out suggestions as to key relationships and matters of broad structure so that, when assembled, the variations would form a homogeneous unit. He himself wrote the finale for the work." This oddly fashioned composition, when played by the Cincinnati orchestra, contained single variations by Ernest Bloch, Aaron Copland '40, Paul Creston, Anis Fuleihan, Howard Hanson '41, Roy Harris '40, Walter Piston, Bernard Rogers, William Schuman '42, and Deems Taylor '40.

Goossens, an American citizen since 1943, is "very British," according to *Cue*'s description. "Tall and well-built, [he] talks [in clipped British accents] with that odd balance of friendly warmth and courteous reserve one finds in the cultivated Englishman." The composer has been married twice. After a divorce from his first wife, Dorothy Dodsworth, to whom he was married in 1919, he was married to Janet Lewis in 1930. There are three children by the first marriage, Annie, Jane, and Julia, and two by the second, Renée and Sidonie. The second Mrs. Goossens obtained a divorce in 1944.

In view of the fact that mathematics underlies the development of a musical composition, it is not surprising that Goossens once thought of being an architect and displays a special interest in design and decoration, and in sketching ships and Gothic churches. Says the composer: "Architecture has always absorbed me, and at one time I used to sketch every building I could find." He likes, too, an occasional game of golf, but is not what one could call a sports lover, although he formerly enjoyed fencing. His secretary in his pre-United States days once listed as his weaknesses "his London tailor and his Paris shirtmaker."

Goossens, who is not fond of club life, is happiest in rural or semi-rural surroundings. In his own words, he finds a Tudor house with some adjoining elm trees "more fascinating to keep company with than the club bore." As a climax to real contentment, he says that most of all he enjoys "being left alone . . . with a library of good books." Another unmusical diversion to which he will admit, according to *Cue*, is a passion for locomotives and steamships. The conductor-composer, who occasionally likes to "get away from music," is tremendously interested in locomotives, likes to ride in the cab, and once drove the Ohio State Express for ten miles, and that without accident. He spends his summers in Connecticut, composing in the morning and painting or sketching in the afternoon.

GOSS, ALBERT S. (gŏs) Oct. 14, 1882-
Agricultural leader

Address: b. 744 Jackson Pl., Washington, D. C.; h. 2800 McKinley Pl., Washington, D. C.

The head of the oldest farm organization in the United States calls himself a "barnyard

ALBERT S. GOSS

economist." He is Albert S. Goss, who occupies a key position in the agricultural sphere as master of the National Grange. Since his election to this responsible post in 1941, Goss has effectively fostered Grange policies during the years of increased wartime agricultural problems. He has been an outspoken critic of the New Deal farm policies and has on occasion voiced strong opposition to the Administration's subsidy program. The National Grange is a highly influential body and boasts of a long history in American agricultural affairs. The power wielded by this conservative farm group has been felt with growing force in recent years. Writing in the New York *Herald Tribune* in February 1943, J. W. Johnston stressed the potential power of the farm bloc and ventured that a well-knit organization "might dominate Congress."

Albert S. Goss was born in Rochester, New York, October 14, 1882, to John W. and Flora M. (Alling) Goss. The family moved across the country when the boy was quite young, and from 1889 to 1898 they lived in Spokane, Washington. After attending high school and business college, Albert in 1901 began working as a bookkeeper. He left this occupation to learn the milling trade, and in time he was operating a flour mill. While he was engaged in this he bought a country store, which he owned for seven years, and later he became a farmer. For an interim he was also connected with a telephone company; then in 1914 he took up farming again.

Goss showed an early interest in farm organization and he has been actively identified with the Grange since 1920. He became master of the Washington State Grange in 1922, following a number of stormy years which culminated in the expulsion of the former master. Goss remained as head until 1933. Most of this time he was also chairman of the executive committee of the National Grange (1924-33). From 1928 to 1933 Goss was director of the Federal Land Bank in Spokane, Washington, a valuable preliminary to his next office, for, in 1933 came his appointment as Federal Land Bank Commissioner in the Farm Credit Administration. Goss held this position for seven years, leaving at the end of this period, he explains, in protest against the efforts which were being made to convert the system from a cooperative credit system to a Government-controlled system.

As Grange master, Goss strives to maintain the traditions of his long-established organization. The National Grange was founded at the end of the Civil War and still retains its secret ritualistic character. (The word "grange" is used in England to mean "farmstead" or "farm estate.") This rural fraternity provides social outlets as well as occupational organization, and draws its membership from the entire family group. It is the largest of the major farm associations—members attending its seventy-fifth convention came from forty different states. (The three other major agricultural organizations in the United States are the National Farmers Union, of which James G. Patton '45 is president; the National Council of Farmer Cooperatives, of which Homer L. Brinkley is president, and the American Farm Bureau Federation, whose president is Edward O'Neal.)

With its headquarters in Washington, D. C., the Grange pursues its principles and program in the Capital, frequently in Congressional chambers. However, the group has no political affiliations, and Goss appeared before both the Democratic and Republican national conventions of 1944 to express the views of the Grange. There is considerable interest in Grange opinion, since the organization is a large representative farm body. Dorothea Kahn in the *Christian Science Monitor* summarized Master Goss's speech to the Seventy-sixth Annual Convention of the Grange: "Increased farm production is needed not only to win the war but to insure a happier postwar world, and means must be found to make possible an international economy of plenty when the war is over."

In the past the Grange has confined itself to suggesting general peace proposals. But at its convention in November 1944 Goss emphasized to the farmers their stake in the peace, stating that the time had come for aggressive planning. He offered three "Grange Guideposts" as determinants in the formulation of foreign and domestic policy: (1) All prosperity springs from the production of wealth. (2) The compensation of each person should be based upon what he contributes to the general welfare. (3) The prime purpose of government is to protect its citizens from aggression. The Grange's endorsement of international cooperation was indicated in January 1945 when the organization approved, with specifications, the Dumbarton Oaks plan, the Bretton Woods conference (with reservations), and the International Food Conference. According to the New York *World-Telegram*, Goss made an important contribution to clear thinking on international trade and the Bretton Woods agreements in testimony before the House Committee on Banking and Currency in May 1945: "If any nation expects to preserve its credit, it must produce something to sell to pay for what it buys. If a nation sells as much as it buys, there is a demand for its currency because those who buy goods from that nation will have to buy currency to pay for the goods." At the meeting of the United Nations Food and Agricultural Organization at Quebec in October 1945, Goss joined with the presidents of the other large farmer organizations—the National Council of Farm Cooperatives, the American Farm Bureau Federation, and the National Farmers Union—in proposing an international commodity control body that would pool farm commodities from countries with surpluses, for distribution to countries with shortages.

The farm leader has been a vigorous opponent of the Administration's food program. The most heated campaign involving Government policy centered around the subsidy issue. Goss disapproved of the subsidy principle, and the Grange was firmly in the anti-subsidy camp. The *Christian Science Monitor* noted the importance of the fight and commented: "There is no doubt that the opposition of the Grange indicates not merely the position of a few leaders but of the rank and file." Goss was strong in his denunciation of subsidies, labeling them inflationary agents and arguing that "subsidies breed more subsidies." He took every opportunity to present the Grange's view on this vital issue and was widely quoted in the press. A typical example of his arguments follows: "In case of unavoidable shortage, rationing is the most practical course. . . .Subsidies may be justified as an aid or incentive to secure abnormal production in special cases where costs are too high to permit production normally. This is a very different principle from employing them to hold down the general price level to consumers. When so employed the effect is to pass on to the Government part of our normal living costs. This form of socialism is wholly unjustifiable."

Goss carried his fight into the Nation's legislative halls and expressed his views to President Roosevelt '42. In 1942, when price control legislation was under consideration, the Grange leader appeared before the Senate Committee on Banking and Currency and presented his arguments and recommendations. Again in 1943 Goss appeared before this committee to argue against food subsidies. He testified at subsidy hearings in forceful, simple language and was termed "the strongest voice in the farm lobby." Goss attended a conference at the White House in April 1943 at which he expressed his ideas on subsidies and inflation to the President. In the course of his anti-subsidy campaign Goss also sent letters to every member of Congress. Finally, in March 1944, after his opposition to the subsidy program, Goss offered suggestions for a compromise. He advocated the "gradual abandonment of certain types of subsidies and retention of others." In the heat of the subsidy battle the farmers were accused of profiteering and conspiracy. Goss defended them as well as his organization against such accusations, producing statistics to prove the unsoundness of the charges. He introduced evidence of the low-income and sub-standard living conditions in many American farm homes.

In February 1944 Goss attended the national postwar conference at Atlantic City. This gathering was composed of sixteen organizations representing the entire range of the Nation's economy. The Grange chief was a member of the temporary organizing committee and also served as chairman of the drafting committee. In this latter capacity he helped prepare the conference's statement of policy which affirmed the need for cooperative efforts to win the war and attain postwar plenty for the country. Later that same year, in November, President Roosevelt appointed Goss a member of the War Mobilization and Reconversion Advisory Board. Goss also served on the Labor-Management Committee of the War Manpower Commission. Thus the New Deal critic functions as agricultural representative in these essential Government agencies. In March 1945 he was assigned to a subcommittee of the Advisory Board to the Office of War Mobilization and Reconversion to study the problem of a guaranteed annual wage in peacetime, with Eric Johnston '43 of the United States Chamber of Commerce, Philip Murray '41 of the CIO, and Anna Rosenberg '43 of the Manpower Commission as the other members. On the question of compulsory military training in peacetime, Goss and his Grange were opposed to any action "until the terms of any international agreement are known and until the men at the front have ample opportunity to participate in the determination of policies so far-reaching."

Goss has been referred to as "a spare, gray, grim dissenter." Although his voice is soft, his manner carries conviction and commands attention. He is a friendly but reserved man and is reputed to look more like a professor than the master of eight thousand local granges. A slim one hundred and forty pounds, Goss is five feet seven and a half inches tall, has blue eyes and a white mustache. He and his wife, the former Minnie E. Hand, to whom he was married in 1907, live in Washington, D. C. They have three children—Ruth Dorothy Hanssen, Warren Hand, and Betty Jane (Mrs. Samuel J. Guill). Goss is now completing his second term as master of the Grange; he was re-elected to the office for a two-year term in 1943. His absorption in agricultural problems provoked this apt remark in a magazine characterization of Goss: "Farm credit remains his pet subject; subsidies are his main gripe."

Who's Who in America, 1944-45

GOULD, MORTON (gōōld) Dec. 10, 1913-
Composer; conductor

Address: b. 30 Rockefeller Plaza, New York City; h. 77-35 113th St., Forest Hills, Long Island, N.Y.

One of the leading musical interpreters of the contemporary American scene is the youthful composer-conductor-pianist, Morton Gould, whom José Iturbi '43 has called "the most talented young composer in America." Gould's compositions have been conducted by Toscanini '42, Stokowski '41, Barbirolli '40, and Reiner '41. As a conductor of note himself, he has led the New York Philharmonic-Symphony and for

MORTON GOULD

many years has been arranging and conducting music for radio programs.

Morton Gould is a native New Yorker, born in Richmond Hill, Long Island, on December 10, 1913, the eldest of the four sons of James and Frances Gould. His father was Viennese and it was his playing of waltzes that first influenced the boy musically. The band of the American Legion post across the street from the Gould home also had its effect on the young would-be composer, for one day at the age of four the child went to the piano and improvised a martial tune. As soon as his parents discovered his musical gift, he was sent to teachers—Abby Whiteside for piano and Vincent Jones for composition. The boy soon won a reputation as a prodigy and was engaged to play over station WOR. He played his first published piece over that station when he was seven, a composition composed at the age of six and aptly titled "Just Six." A year later he won a scholarship to the New York Institute of Musical Art. He attended Richmond Hill High School but left before finishing in order to concentrate on his music. At fifteen he had completed the courses at New York University's Music School.

In his early teens Gould's artistic efforts were divided between the piano and the palette, and it is said that his paintings showed great promise. For a period he was so fascinated by the bohemianism of a group of Greenwich Village artists that he persuaded his parents to allow him to join the artists for a summer at the artists' colony at Woodstock, New York. "My parents, hoping to discourage me, gave me only enough money to stay a week," he reveals. "However, I supported myself by giving music lessons and Sunday concerts. 'Stravinsky, Schoenberg, Hindemith, *Gould,*' the handbills read. You see, I modestly gave myself last billing. Incidentally," the musician continues, "I found myself supporting my friends while they sat around and talked art all day. Suddenly I realized that the real artists at Woodstock worked while my friends talked. When I got sick and they deserted me, I was through with bohemianism."

At seventeen Gould launched his career, with a concert tour, and later he gave an impressive performance of Ravel's *Bolero* during a vaudeville engagement in which "he thumped the keys with his arms to simulate the crashing drums at the climax." At eighteen he joined the music staff of New York's Roxy and Music Hall theaters, and the following year he accepted a position with the National Broadcasting Company, in which he did duo-piano work. When he was twenty-one his "break" came—in 1934 he was given his own program on WOR. He remained at NBC for nine years, conducting his large symphony orchestra in his own and others' music, ranging from the classics to swing. He has conducted an orchestra on CBS programs, among them *Shower of Stars* and the *Cresta Blanca Carnival,* in which he was co-starred with Alec Templeton '40. Until mid-July 1945 he also conducted his own program, *The Music of Morton Gould,* each Thursday night over CBS. *Variety* reported on July 25 that an expanded Gould radio show, featuring him as a composer, is being prepared for a potential sponsor. (Since he does not have the time to practice, Gould no longer plays the piano professionally.) As guest conductor, he has directed the New York Philharmonic, the symphony orchestras of Los Angeles, St. Louis, Cincinnati, Minneapolis, and other cities, in addition to participating in high school and college musical affairs in different localities. He has also lectured at various universities.

Turning temporarily from his radio career, in 1944 Gould composed and conducted the music for the picture *Delightfully Dangerous* (1945). The Gould cinematic score included six songs and an arrangement of Strauss waltzes which were the "best recommendations" of the film, according to *Variety*'s reviewer. The composer also had a small speaking role in the picture and he later told a reporter that his first experience before the camera as an actor was terrifying.

Gould's compositions have a definite American flavor, written, as they are, largely in the modern idiom on American themes, with frequent use of jazz rhythms. (He has acknowledged a debt to George Gershwin, and his work is also said to show the influence of the modern composer Dmitri Shostakovich '41.) "Blue-nose musicians," reports Mary Braggiotti in the New York *Post,* "have been known to call Gould the 'enfant terrible' of American music" because of this use of jazz rhythms in serious music. Critical estimates vary considerably—an ingenuity and versatility in his compositions are pointed out, while the intellectual content is frequently criticized. His works, nevertheless, are among the most frequently performed of serious modern American music, and many of his compositions have been recorded. (His ability as an arranger and orchestrator has received wide acknowledgment.) Leopold Stokowski once said that Gould's *Chorale and Fugue in Jazz,* composed at the age of eighteen, was "the most daring and creative work" ever submitted to him.

In April 1940 the twenty-six-year-old musician conducted the University of Michigan band in the première performance of his *Cow-*

boy Rhapsody, written in thirty-six hours especially for that band. This was Gould's first composition written specifically for band performance although many bands had used arrangements of his works. Presenting a melodic pattern of seven famous cowboy folk songs, among them "Bury Me Not on the Lone Prairee", "Git Along, Little Dogie," and "Home on the Range," the work became popular immediately. In commenting on the music after the first performance, Louis Untermeyer said, "It was brilliant—and exciting, too. It had an element of surprise. You knew the tunes, but there was such a new presentation that it was dynamite. I was on the edge of mv seat, or was it my saddle?"

Earlier that year Gould's *Foster Gallery* and the *Pavane*, the second movement of his second *American Symphonette*, had been performed by Fritz Reiner and the Pittsburgh Orchestra. When Howard Barlow ['40] conducted the New York Philharmonic in his reading of three pieces from this work in November 1942, Olin Downes wrote of them, "The pieces are not marvels of originality, but they are short and lively, in a generally jocose vein, with dashing instrumentation." In March 1941 after John Barbirolli conducted the Philharmonic in a performance of *Foster Gallery*, critic Henry Simon pronounced the work "as clever a piece of smart-aleckry as Carnegie Hall has heard all winter." This composition consists of thirteen short movements based on melodies by Stephen Foster; Simon remarked that, through Gould's orchestration, "Jeannie's light brown hair went to a barber shop, where it was torn out in fistfuls by a drunken barber." When the Pittsburgh Symphony gave its first performance of this work, one critic called it "a brilliant piece of orchestral writing, somewhat overweighted and too long, but daring and often skillful in its interweaving of well-known melodies."

Late in 1942 both Stokowski and Rodzinski ['40] played Gould's *Spirituals for String Choir and Orchestra*, which was based on American spirituals. This composition was among five later chosen by the New York Music Critics' Circle for consideration as the best symphonic work of the year. Also, in November 1942, the musician achieved further recognition in his field when Toscanini conducted the first performance of his *Lincoln Legend*. Shortly thereafter the Soviet Government requested a copy of the score, which was sent by radio photo-film in exchange for new Russian music. During the summer of 1943 Gould was invited to conduct the Philharmonic at New York's Lewisohn Stadium. He devoted one concert to a United Nations program and on the Fourth of July conducted a holiday program of contemporary American works. The New York *Times* critic commented that Gould directed "in an alert, incisive manner, and invested his readings with ingratiating rhythmic precision, mood, and color," while another columnist remarked that he "certainly knows the orchestral checks and balances." During that summer his *Boogie-Woogie Etude*, played by José Iturbi, had its first performance on his own radio program. According to radio reporter Harriet Van Horne, the composition grew out of a luncheon discussion between the composer and the pianist; it was completed the same night and performed on the next. The response to the Etude was reportedly "sensational": orchestras throughout the country wired for permission to use the work, it was played by the noted Puerto Rican pianist Jesús María Sanromá and a symphony orchestra over the Blue Network, and soon Iturbi repeated his performance on another Gould show.

The première of Gould's *Symphony on Marching Tunes* in early June 1944 received generally unflattering reviews. Commissioned by the YMCA in commemoration of the organization's one hundredth anniversary and dedicated to "freedom-loving youth of the world," the work was considered as lacking in genuine symphonic quality. While *PM*'s critic noted earnestness and skill in the composition, he felt, nevertheless, "that a real musical talent has not yet found itself in spite of a serious effort." The critic of the New York *Herald Tribune* was more severe in his judgment, labeling the work "an eclectic product, wholly wanting in stylistic unity"; he singled out the last movement for special censure because of its "dreary application of Shostakovichian methods of harmonization and instrumentation, including the wide spacing of sonorities." Vladimir Golschmann conducted the Cleveland Orchestra in two performances of the Gould Concerto for Orchestra in February 1945. This symphonic "show piece" in three movements, "which "revels in swing rhythms and boogie-woogie," employs all the known percussion instruments and two saxophones. According to Elmore Bacon in *Musical America*, it is "ingenious, brilliant, colorful, and toe-tapping to the nth degree."

In the summer of 1945 Frank Black conducted the *General Motors Symphony of the Air* in the first performance of another Gould composition, the Concerto for Viola and Orchestra. Two months later the British pianist, Percy Grainger, played Gould's *American Concertette* at a Chicago concert. Reviewing the performance in the *Christian Science Monitor*, Felix Borowski declared, "The music as a whole was clever and ingenious, but there was little in it that was beautiful or eloquent." This music is used by Jerome Robbins in his ballet *Interplay*, which formed one of the principal and most popular acts of Billy Rose's ['40] musical, *Concert Varieties*, and which was included in the Ballet Theatre's repertory at the Metropolitan Opera House during the 1945 fall season. Also in 1945, Gould wrote the music for, and appeared with his orchestra in, Charles R. Rogers' United Artists picture *Delightfully Dangerous*. And he contributed the "rich and varied" score to the Betty Comden ['45]-Adolph Green ['45] musical *Billion Dollar Baby*.

In an interview published in *Etude* in January 1944, Gould gives advice to student musicians, stressing as of primary importance "the great, sweeping, structural lines" of creative ideas which are symbolized by notes in music. "The serious musician of tomorrow must familiarize himself with as many styles and 'schools' of music as he can. He must absorb not only the conventional classic repertory; he must be able also to read, feel, and express all contemporary American music. Jazz, for

GOULD, MORTON—*Continued*

instance, is important as a contemporary idiom."

In June 1945 Gould addressed the Conference of the Independent Citizens Committee of the Arts, Sciences and Professions, a body devoted to the study of employment problems and expansion in those fields. Speaking on "Music in Radio," the musician, while recognizing certain commercial considerations, urged advertising and broadcasting officials to devote part of their energies to encouraging contemporary music. Gould considers radio a potent force in American life, attributing a large measure of the Nation's musical growth to its influence. Radio columnist Arnold Blom says that Gould's specifications for his own program include a fifty-piece orchestra, the kind of music he prefers, and no comedian. Rather than compromise his principles, Gould has said that he would relinquish a position. While he has no political connections, Gould once told an interviewer, he considers it important for the artist to be politically conscious. It is the artist's responsibility, he maintains, to help in the betterment of humanity and thus work toward a "more meaningful art."

A slim figure of medium height, fair-haired and blue-eyed, the composer "seldom smiles among friends and absolutely never on the podium." "I'm not a glamour boy," he says. "When I'm out on the stage I'm there to do my work. There's nothing to smile about. In fact, it's usually pretty grim." Off-podium, he is a humorous man with a liking for golf and ping-pong, reading, and the theater. He was married to Shirley Banks of Minneapolis on May 22, 1944, and a son, Eric Franklin was born in 1945. The family lives in a Forest Hills apartment, where Gould composes, oblivious to neighborhood noises. In 1945 he was at work on a Concerto for Clarinet for Benny Goodman '42, a ballet, and an opera based on the Biblical story of Joseph. His belief is that "the outlook for the creative and interpretative future of American music is a heartening one."

Who Is Who in Music, 1941

GRAHAM, GWETHALYN Jan. 18, 1913- Author

Address: b. c/o Monica McCall, Myron Selznick, Ltd., 610 Fifth Ave., New York City; h. 4129 Dorchester St., West, Montreal, Canada

One of the most timely and noteworthy novels of 1944 is Gwethalyn Graham's *Earth and High Heaven*, a thrust at racial bigotry and intolerance, specifically a story of anti-Semitism in Canada. "When people have asked me what my book is about," Miss Graham writes, "I have usually ended by saying that it is a plea for the individual, that he or she may be regarded and respected as such and not judged arbitrarily according to a category."

The daughter of Frank and Isabel Russell (MacCurdy) Erichsen-Brown, Gwethalyn Graham Erichsen-Brown was born in Toronto, on January 18, 1913, into a cultivated Canadian family of the Anglican, High Church faith. Her father is a lawyer and an enthusiastic amateur painter, and her mother, one of the leaders in the Canadian woman's suffrage movement, is "an unclassifiable individual whose interests range through people and books and music to too many organizations for which she does more work than is good for her." Miss Graham derived her strongly internationalist outlook from them and from her grandfather, a student of Oriental languages and "a genuine internationalist." "He was an individualist in the finest sense of the word," says Miss Graham, "and I remember that he would not tolerate the use of any of the derogatory slang words which label national or religious groups on this continent—such words as 'Wop', 'Mick', 'Hun,' or 'Chink.' "

Miss Graham lived in Toronto until she was sixteen, when she went to Europe to attend a girls' boarding school at Lausanne, Switzerland—Pensionnat des Allieres, where forty-eight girls represented twenty nationalities. Here she spent the year 1929. This experience was the background of her first novel, *Swiss Sonata*. (From the age of six she had taken it for granted that she would be a writer.) Published in the United States and England in 1938, it deals with the effects of the growth of Fascism and Hitlerism in that school, the action covering the three days immediately preceding the Saar plebiscite in 1935. Receiving the Governor General's Award for Fiction in 1938, it was added to the Nazis' blacklist.

After her Swiss schooling Miss Graham continued her education at Havergal College, Toronto, and then crossed the Canadian border to attend Smith College in Massachusetts (1931-32). She returned to Montreal in 1934 and has lived there since. In 1938 she spent six months in London, where she met many refugees. "Their plight sounded bad enough over here," she declared, "but there I saw them on the park benches." She hated to admit that she was a Canadian because her Government had refused to admit refugees unless they were wealthy or willing to become farmers. Back home, she devoted her energies toward circulating petitions and making speeches for the admission of refugees.

Miss Graham's deepening interest in sociological and human problems found expression in the writing of *Earth and High Heaven* with its problem of marriage between a Jewish man and a Gentile girl. Published in October 1944, it was the selection of the Literary Guild for that month. It was considered very daring when a month previously the popular periodical *Collier's* started serializing the novel, and the Writers' War Board went out of its way to praise the progressiveness of the weekly in so doing. The sale of the motion picture rights to Samuel Goldwyn '44 was considered another bit of evidence that the film industry, too, is willing to face basic issues.

Set in the city of Montreal, *Earth and High Heaven* is a novel "about two people in love who are confronted by almost insurmountable obstacles to their marriage—obstacles which arise directly from the way in which most of us have been taught to think," explains Miss Graham. It is the age-old conflict of racial and religious prejudices that separates Erica Drake, the daughter of a socially prominent English-Canadian family, and Marc Reiser, the young Jewish lawyer she loves. Their problem "actually turned out, in the end, to be simpler than either of them realized, because they both knew what they wanted; they knew what they would have to pay for it, and since in the course of their struggle against society, they had attained a certain degree of self-realization, they knew that they could afford to pay the price. And they were safe," Miss Graham concluded.

Critics lauded Miss Graham's treatment of the controversial theme, pointing out that the work is an expert blending of both a thesis and a novel. (One of Miss Graham's aversions is the "propaganda" novel, an epithet which reviewers found could not be hurled at her book.) "Her story has charm, romantic appeal, and dramatic force, as well as 'social significance,'" observed Orville Prescott in the New York *Times*. The smoothness and polish of her writing were noted. Rosemary Carr Benét commented in the *Saturday Review of Literature*: "It is skillful and mature work. Miss Graham has a good ear for conversation, a true flair for dialogue, and a saving sense of humor even when she is serious." It was pointed out, however, that *Earth and High Heaven* "does not penetrate very deeply beneath the outer surfaces of the characters, nor very deeply into the roots of anti-Semitism"; Bernard De Voto '43 noted that the emotional reconciliation at the conclusion of the novel is "hardly a solution to the problem originally posed." Perhaps the ultimate value of the book, as Prescott writes, is that "a book like Miss Graham's, a book which contains every element necessary for popularity, can help to dramatize for many the pity, the folly, and the injustice of race prejudice." In awarding the *Saturday Review of Literature* Anisfield-Wolf Prize for the best book on race relations (the 1945 award was divided between *Earth and High Heaven* and Gunnar Myrdal's *An American Dilemma*), the award committee stated, "Miss Graham's novel is one of the most sensitive and penetrating studies of the social relations between Jews and Christians in a long-established Anglo-Saxon community that has been written in our times. . . .Not only is this book an excellent study of Canadian racial relations, it is an admirable novel." It was given the Governor General's award for the best novel written by a Canadian in 1944. (Her *Swiss Sonata* had won the Governor General's award for 1938.) It was high on the best-seller lists for several months—in the first six months after publication 665,000 copies were sold. It has been printed in Braille, for the blind, and the movie rights were purchased by Samuel Goldwyn '44.

After the publication of the book it was reported that Miss Graham was working on a novel "dealing principally with English-French relations and the effects of monopoly capitalism working jointly with the church to maintain the status quo." Developing her philosophy of the individual, she writes: "At the present time, the individual is recognized as the basis of our political system and there recognition ends, so that as yet democracy has only been partially realized. In order for it to be fully realized, the individual must be regarded as the basis of our *economic* system, which means production primarily for consumption, with profit the secondary motive rather than the other way round, and, finally, both in the national and international fields, he must be freed from the prison of judgments based almost entirely on so-called 'group, religious, or racial' characteristics."

GWETHALYN GRAHAM

Miss Graham believes that the French school of writers have influenced her work markedly. "If I could choose to write like anyone," she has said, "it would be Stendhal." Of the American and English novelists, she admires Ernest Hemingway, John Steinbeck '40, Thomas Wolfe, Willa Cather, Ford Madox Ford, and Somerset Maugham; the greatest novel of the last ten years, she believes, is Arthur Koestler's '43 *Darkness at Noon.*

In addition to her writing, Gwethalyn Graham spends a considerable amount of time in mothering her son Anthony. (She was married in 1932 and has since been divorced.) The tall, reddish-brown-haired writer likes sailing, skiing, and music.

GREGORY, EDMUND B(RISTOL) July 4, 1882- United States Army officer

Address: b. Office of the Quartermaster General, War Department, Washington, D.C.; h. 4401 Greenwich Parkway, N.W., Washington, D.C.

"If the United States Army were to advertise for a Quartermaster General," suggests Arthur Bartlett in the New York *Herald Tribune,* "the ad would have to run something like this: 'Wanted: Man to feed, clothe, house, and transport a million soldiers . . . business with yearly volume in the billions.' " The man the Army chose for this job in April 1940 is Lieutenant General Edmund B. Gregory, a veteran of the Quartermaster Corps since 1916. After the Second World War he was to turn from purchasing to selling when he was appointed chairman of the new War Assets Corporation.

U.S. Army Signal Corps

LT. GEN. EDMUND B. GREGORY

Born at Storm Lake, Iowa, July 4, 1882, Edmund Bristol Gregory is the son of Frank Buckingham and Emily Hatch (Bristol) Gregory. He began his military career shortly before his twenty-second birthday, having been graduated from the United States Military Academy on June 15, 1904, with a commission as a second lieutenant of Infantry. His first assignment was with the Fourteenth Infantry, which he joined at Camp Connell, Philippine Islands, on November 7 of that year. With the exception of a period as instructor in the department of English and history at West Point from July 1911 to December 1912, Gregory remained with the Fourteenth for eleven years. (In July 1911 he was married to Verna Ellsworth Green.)

Gregory's second assignment with his unit was at Vancouver Barracks, Washington, where he was stationed from April 24, 1905, until January 2, 1908. At the end of this period he again went to the Philippines, taking up station at Warwick Barracks. He remained with his regiment on that duty until February 15, 1910, when it was returned to the States and assigned to Fort William Henry Harrison in Montana. In Montana in March 1911 Gregory received his promotion to the rank of first lieutenant; four months later he was assigned to teach at West Point. When he rejoined his unit in December 1912 it was stationed at Fort Lawton, Washington. He remained with it until the end of 1915, when he returned for the third time to the Philippines. In this assignment he served with the Eighth Infantry at Cuartel de Espana for a year, until March 5, 1916, and with the Twenty-seventh at the same post until December 5. While with the latter group, in July 1916, he received his captaincy.

It was at this time that Captain Gregory was detailed to the Quartermaster Corps. He served first as assistant to the quartermaster at the headquarters of the Philippine Department in Manila, where he remained until July 15, 1917. After he returned to the States he received a promotion to major (temporary) that August and was assigned to duty at the General Supply Depot at Jefferson, Indiana. During the next four years, until March 1921, he served in a series of posts: he was assistant to the supply officer, officer in charge of the inspection division, officer in charge of the supplies division, zone storage officer, officer in charge of the supply service, and executive officer. In October 1918 he was promoted to lieutenant colonel (temporary). In May 1920 he reverted to his permanent rank of captain, and the following July he was given the permanent rank of major in the Regular Army.

Following a month and a half of duty as quartermaster supply officer at the Columbus Reserve Depot in Columbus, Ohio, Major Gregory was next assigned as assistant quartermaster supply officer at the Atlanta (Georgia) General Intermediate Depot. In July 1922 he was shifted to Washington, D. C., where he served for one month in the Sales Branch of the Office of the Assistant Secretary of War. In August he was ordered to the Orient as War Department representative, in connection with cooperative union contracts with the United States for sale of war supplies. He arrived at Shanghai on September 5 and remained until May 9, 1924.

After Gregory had returned to the United States he served for several months in the Office of the Assistant Secretary of War in Washington. Following that temporary assignment, from October to August 1927 he was an instructor in the New York National Guard. Then, in keeping with the Army's policy of periodic schooling for officers, the Major became a student at Harvard University's Graduate School of Business Administration. While there he was made a lieutenant colonel and in June 1929 he was graduated with the degree of Master of Business Administration. Taking up military duties again, for the next four years he served in the Office of the Quartermaster General in Washington. In August 1933 he became acting quartermaster at the headquarters of the Second Corps Area on Governors Island. He was later made executive officer and in August 1935 raised to a full colonel. In June 1936 he once more became a student, this time at the Army War College in Washington. After his graduation the following June he returned to the Office of the Quartermaster General in Washington, and on April 1, three years later, he was appointed Quartermaster General himself, with the rank of major general.

General Gregory was immediately confronted with the program of expansion which was under way for the Army. For the first time in history appropriations by Congress permitted large-scale maneuvers to test the plans and equipment. These maneuvers required long-range plans by the Quartermaster Corps. Estimates for food, billeting, transportation, and supplies which would be used in a real war had to be made well in advance and the logistics for their distribution prepared. The new QMG was getting a taste of the future in small doses. The same year the doses grew larger. The National Guard was called into active service for a year. The draft act followed and even before the attack on Pearl Harbor in December 1941 the Army began its climb toward astronomical figures in men and required matériel. Gregory's was considered the toughest job in the Army.

To begin with, extensive tests were made to develop vehicles suitable for the rigors of military transportation across all types of terrain. On the proving grounds of the Quartermaster Corps at Holabird, Maryland, many cars offered by manufacturers were shaken and pounded into wrecks. Some persons thought the tests were too severe, but Gregory stood by his demands. The results were the now famous "jeep" and other trucks and cars of capabilities fitted to their assignments, together rated the sturdiest motorized equipment in the world.

Probably the most important of the responsibilities of the Quartermaster Corps, however, at least to the individual soldier, was Army "chow." To back up his statement, "We've got the best-fed army in the world," Gregory detailed a group of enlisted men to find out what food the soldiers liked, and what food they ate only because it was served to them. In a twelve-month period the men examined meals served to 2,474,362 men in 500 Army mess halls, measured the uneaten food thrown into garbage cans, and noted eating habits. As a result of the investigation, new regulations were issued for the preparation of Army meals, and the food bill was lowered when a calculated percentage of absenteeism at meals was taken into account.

When stricter rationing on the home front brought charges that the Army was wasting food, General Gregory said that investigations had already resulted in a drive to cut wastage from 21 to 11 per cent. In reply to charges of hoarding he declared, "The presence of . . . canned foods in the packing plant has caused critics to publish charges that the Army has purchased canned goods so far in excess of military needs that there was no place to store them. These published charges, whether innocently or selfishly inspired, simply are not and never have been true." "The real cause for food shortage," he told the Truman '45 Committee during an investigation in April 1943, "is the rising buying power of civilians in this country, which has caused food consumption to soar to record levels." The following May he struck at black market operators, disclosing that illegal markets in some districts continued to hinder Army procurement of food as well as equitable distribution, both civil and military.

In addition to feeding, clothing, and equipping the Army, the Quartermaster General was faced with the problem of housing this vast number of troops. It was his duty to procure and dispose of real estate and housing facilities, and to operate utilities for maintenance and repair. In August 1941 the construction program for the then rapidly expanding Army was sharply criticized by the Senate's Defense Investigating Committee. In a ninety-eight-page report prepared by Chairman Truman and Counsel Hugh A. Fulton, it was charged that as a result of poor judgment, misinformation, and lack of adequate plans for camps, one hundred million dollars was wasted. "We used that . . . figure because the Army admitted that much. It will run two and a half times that much, easily," stated Truman, who also conceded that some of the mistakes were due to Congressional politics. In answer to this criticism of the efficiency of himself and his Quartermaster Corps, General Gregory declared that if the Army wanted maximum speed it had to pay for it; that the Quartermaster Corps alone was not responsible for all the mistakes. According to his charts, 94.8 per cent of Army construction had been completed since his tremendous job of emergency building began the previous June.

The results of research to devise the best in equipment, food, and clothing for the Army during the war were pictured in an article by Gregory written for the January 23, 1944, issue of *This Week*. The Quartermaster General discussed many new products then in military use and, as the title of his article announced—"Army Miracles — for You!" — declared that after the end of the war civilians, too, would have such things as better glassware, crockery, soap, raincoats, antiseptics, and new products of plastics and nylon. As for the disposition of Government-owned surplus goods after the war, that was placed under the direction of Gregory when in December 1945, the President named the Quartermaster General the chairman of the new War Assets Corporation of the Reconstruction Finance Corporation. Gregory's responsibility for the disposition of nearly all war surpluses (the WAC will include the old Surplus Property Administration) will begin February 1, 1946.

Edmund Gregory is a squarish, graying man of medium height, with a quiet Middle Western voice. In the summer of 1945 he returned

GREGORY, EDMUND B.—*Continued*

from a tour of the fighting fronts without a scratch. While resting after the trip, reports Leonard Lyons of the New York *Post*, the Quartermaster General ruptured a tendon in his leg in an unmilitary accident when he attempted to avoid stepping on a snake on his peaceful Maryland farm.

Who's Who in America, 1944-45

GRIBBLE, HARRY WAGSTAFF (GRAHAM-) Playwright; director

Address: b. 349 E. 49th St., New York City

"To review Harry Wagstaff Gribble's career is to be impressed with his versatility." As playwright or as director, and often in both capacities on the same production, Gribble has been successful with comedy, farce, melodrama, drama, musical—with Shakespeare and Shaw '44. His 1944-45 hit, *Anna Lucasta*, is a comedy-drama which he rewrote in part and directed.

George Karger
HARRY WAGSTAFF GRIBBLE

Born around the turn of the century, in the English town of Sevenoaks, Kent, the playwright-director was christened Harry Wagstaff Graham Gribble. Later his father, Theodore Graham Gribble, registered the family name as Graham-Gribble. Young Harry's mother, Mary Emilia (Soltâu) Gribble was of Swiss (Huguenot) ancestry. "I think I must have been born with a love of America," says Gribble, who applied for American citizenship shortly after his arrival in the United States. His father, the construction engineer who built Honolulu's first streetcar lines, brought back from one of his American trips an alluring verbal picture for a nine-year-old Harry. "His description of the country, and especially of New York City's sky line, fascinated me," recalls Gribble. America also represented to him a land of fabulous fortunes. (His father's brother, Henry Gribble had been married to the daughter of Colonel Harry Wagstaff, millionaire associate of the Rockefellers in the early days of the Standard Oil Company.) Always a rebel against tradition, young Gribble first asserted himself when he refused to become a missionary for the Plymouth Brethren, as other Gribbles had done, and announced his conversion to Episcopalianism. Shortly afterward he was confirmed by the Bishop of London in Westminster Abbey.

After attending Clarence School, in Weston super Mare on the Bristol Channel, young Gribble entered Emmanuel College at Cambridge in 1910. When a reversal of the family fortune ended his college career two years later, he joined a theatrical company going to South Africa. His meeting with the Oxford-educated son of a Zulu chief on this tour, explains Gribble, was the beginning of his interest in the Negro. "I have always found the Negro," says the director of *Anna Lucasta*, "vital and stimulating." On his return to England Gribble studied to be a chartered accountant, but the theater again captured his interest. As actor he appeared in 1913 in the motion picture *Nellie's Ride*. Gribble still shivers when he recalls his big scene in the film, in which bound to a rock in a stormy sea—both storm and sea the real things—he waited while Nellie rode to his rescue. One of his experiments, an attempt to lighten with a calcimine-like liquid the shadows cast by the poor lighting system on the actors' faces, caused audiences to wonder whether they were watching white-faced clowns or wraiths. In spite of this defect, however, the picture won him a contract with a New York film company.

"But when I arrived in New York," relates Gribble, "I could not locate the company on my important-looking contract." (There were many fly-by-night film companies in those embryo days of the cinema.) The young Englishman was rescued from his plight by Mrs. Pat Campbell and her company, who engaged him as stage manager for their New York engagement and transcontinental tour in Shaw's '44 *Pygmalion* (1914). Other small jobs in the theater followed for Gribble before he finally branched out as a playwright. This opportunity came while he was serving in the Twenty-seventh Division of the United States Army during the First World War. *You Know Me, Al*, written and produced by Gribble, was considered the Army's most successful play. His *Let's Beat It* was also an Army production.

On his discharge from the Army, Gribble wrote *The Outrageous Mrs. Palmer* (1919), a sophisticated comedy centered around a temperamental actress. The play had a sixteen-week run in Boston, but in New York, following, as it did, the earlier appearance of Brock Pemberton's '45 *Enter, Madame*, also concerning a temperamental star, Gribble's play was deprived of its novelty. Alan Dale, the famous New York critic of the period, was the indirect cause of Gribble's writing his 1921 play, *March Hares*, a forerunner of the type of comedy which Noel Coward '41 and others were to write. Annoyed because the critic had said that he excelled in brilliant dialogue but was weak in dramaturgy, Gribble had decided to write a play without intricate plot development, which in that day was considered necessary to the success of a play. Despite the fact that

March Hares received a divided press on its opening and failed to achieve a long run, it has become a classic example of sophisticated comedy, produced frequently by art theater groups. On its London presentation six years later, British critics called it a masterpiece in "gay nonsense." The *Spectator*, after pointing out that the play had little substance and a negligible plot, said, "But it delightfully exemplifies the triumph of style over matter. . . . The matter is irradiated by a dainty touch of fantasy. Nobody does anything in the least probable; everybody, confronted with an improbable situation, says things that sound real or plausible. The author's dexterity in dramatic dialogue and a certain solidity of amusingly sketched character provide a sound basis for its unreality."

In 1922 Gribble turned to musical comedy. In collaboration with Harold Atteridge, he wrote the book for *Artists and Models,* a revue produced by the Shuberts, which he also staged. (Other musicals to his credit are *Topics of 1923, Artists and Models of 1924, Cherry Pie* [1926], and *Meet My Sister* [1930].) Two years later, in 1924, Gribble interrupted his writing of comedy to collaborate with Gertrude Purcell on the dramatization of the book *Stella Dallas,* which, however, because of casting complications, never reached Broadway. The play was nevertheless sold to United Artists while it was on the road, and later (1925) Gribble collaborated on its picturization, which was considered an outstanding film. (Since then he has written a number of other scripts. Chief among them are *A Bill of Divorcement* and *A Silent Witness*, both in 1932.)

The playwright's next directorial job was for the highly successful revival of the 1890 melodrama, *After Dark,* which Christopher Morley produced in 1928 in Hoboken, New Jersey. Aiming for travesty, Gribble, in staging the production, emphasized the "staginess" of acting in the eighteen-nineties. Its deep-dyed villain was made more sinister in his pursuit of the "pure-as-snow" heroine, all of which proved to be hilariously amusing to twentieth century New Yorkers. "It became the fad of the hour," reports Burns Mantle '44, "to take the tube to Hoboken and participate in hissing the villain and in cheering the heroine." Seats were booked weeks ahead at speculators' prices during the thirty-two-week run of the play. Encouraged by the success of *After Dark,* Morley leased another Hoboken theater and engaged Gribble to stage similarly a revival of *The Black Crook,* an 1890 musical. Not the least of this show's attractions was the feminine chorus, whose hour-glass figures "never had heard of a Hollywood diet." Gribble's manner of staging these revivals has been often imitated. *Hawkshaw, the Detective, The Drunkard,* and *The Fatal Wedding* are among the "mellers" presented by other producers.

Another of the outstanding plays of the thirty or more Gribble has directed since 1928 is *Cynara* (1931), adapted from the novel *The Imperfect Lover* by the author, R. F. Gore-Brown, and H. M. Harwood. In the opinion of *Outlook,* it was written and directed with such skill that it has none of the gaps or the literary flavor usually prevailing in dramatized novels; and Burns Mantle placed it on his list of the season's ten best plays. Gribble was also the director of the memorable production of *The Taming of the Shrew* in 1935, in which the Lunts '41 were starred. Stark Young, pointing out that the aim of good staging is to have the production in harmony with the mood of the play, said that this had been "excellently devised" in the play. "Gribble has directed the whole affair," commented Brooks Atkinson '42, "with the versatility and dispatch of a musical comedy ringmaster."

In 1940 the playwright-director, tiring of the inconsequential plays which producers had assigned to him in the preceding years, became a producer on his own. In the era of plotless plays about everyday, undramatic people, Gribble, who had stimulated this school of writing, again bucked precedent. He selected for his first production Elmer Harris' *Johnny Belinda,* the story of an unmarried deaf mute who becomes a mother. The *Commonweal* critic, who found the theme fresh and poignant and the cast admirable, commented that Gribble had directed it "with his accustomed skill." "Sophisticated we may be," said the *Catholic World,* "but sentiment is not yet banished from the twentieth century breast. The audience is squarely behind the young mother, the same emotion which caused thousands to weep for the *East Lynne* mother, and will continue to do so—we hope—as long as the world spins on." (The audience supported the play for a year's run on Broadway.) Rosamond Gilder, on the other hand, regarded the play as a "stunt," although she considered Gribble's direction of the pantomime used by the deaf-mute heroine and her teacher as "the eloquence of free bodily movement," a much-needed lesson for "our muscle-bound theater."

It was about 1943 that Gribble became interested in the experimental group, the American Negro Theatre, organized by Frederick O'Neal and Abram Hill '45 in 1940. The group had become interested in a play by Philip Yordan about a Polish-American family and Gribble was asked to direct it. He saw possibilities in the "straggling" script, which had made the rounds of the Broadway producers for seven years without success. With Hill's and the author's permission, Gribble says, he "rewrote dialogue, situations, and re-characterized some of the characters. After seventeen weeks of this plus rehearsals the end product, *Anna Lucasta,* was presented in the group's tiny Harlem theater. Spirited bidding by Broadway producers followed, and in the summer of 1944 the play opened downtown. While the majority of the critics felt that it was not great drama, the production as a whole was acclaimed as "one of the most notable theatrical successes in many years," presenting as it did "a serious story of average human beings . . . who happen to have pigmented skins." A year after the opening, with the play still playing to capacity, Gribble was planning to direct a new version of Shakespeare's *Romeo and Juliet,* "based on the premise that the Capulets were of Moorish extraction, thereby injecting a note of racial antipathy into their feud with the Montagues." For his star, he hoped to have *Anna Lucasta*'s lead, Hilda Simms '44. Another project on which Gribble was workning in late 1945 is his autobiography.

GRIBBLE, HARRY WAGSTAFF—*Cont.*
Its title, "Some Days You Have," refers to the financial status of people of the theater.

Gribble is brown-haired and hazel-eyed, a slim-waisted five feet ten inches tall, weighs one hundred and sixty-five pounds. He often wears tweeds and dark blue shirts. In his New York City bachelor apartment overlooking the East River, the Broadway craftsman accumulates clippings on American art and nature. Someday he hopes to have these clippings bound and to donate them to a reference library.

GRONINGER, HOMER M. (grŏn′ĭng-ẽr) July 24, 1884- United States Army officer

Address: b. c/o War Department, Washington, D.C.; Port of Embarkation, San Francisco, Calif.

The commanding general of the San Francisco Port of Embarkation, United States Army Transportation Corps, which in turn is a unit of General Brehon Somervell's '42 Army Service Forces, is Major General Homer M. Groninger. The General, who was appointed to this post in June 1945, had previously spent four years and eight months building up the New York POE to the biggest military port in the world—a huge organization operating round the clock, seven days a week, to procure, process, and transport the several millions of men and scores of millions of tons of war goods needed to supply the entire Atlantic theater of war—operating "with never a mistake and never a halt . . . ever improving and ever expanding. . . .Yet, in the world's greatest city, he conducted his operations so expertly and so secretly that few realized this tremendous port of war was running wide open before their very eyes." In San Francisco after midsummer of 1945 he commanded the transport of men through the Golden Gate as they sailed to and from the scenes of Japan's defeat.

U. S. Army Signal Corps

MAJ. GEN. HOMER M. GRONINGER

Homer M. Groninger was born July 24, 1884, in Port Royal, Pennsylvania. The son of R. Elliott and Mary (McLaughlin) Groninger, he was brought up on his father's farm. Young Homer, or "Cy," as he is still known to his boyhood friends, studied at Airview Academy in Port Royal in 1901-2. While at Pennsylvania State College (1903-4) where he was an ardent baseball player, Groninger read a newspaper account of a game between Army and Navy teams and immediately decided upon a career as an officer. "I chose the Army," General Groninger says, "because I planned to marry some day, and a Navy man doesn't see much of his wife and home." He therefore asked his Congressman for and received an appointment to the United States Military Academy.

At West Point, from which he was graduated in 1908, Cadet Groninger was captain of the baseball team. A dashing polo player, he was commissioned a second lieutenant of Cavalry and assigned to the Fifth Cavalry at Fort Wingate, New Mexico. He accompanied his regiment to Schofield Barracks, Hawaii, where he stayed for a few years, a period broken by a course at the School of Musketry at Monterey, California, in 1912. Then, in early 1913 came service at Fort Huachuca, Arizona. In September 1913 the twenty-nine-year-old lieutenant was married to Gertrude Pomeroy from his home town, who had gone to Sunday school with him. Not long afterward Groninger was sent to Fort Myer, Virginia; his first promotion came a year later. In March 1916 he joined Colonel Pershing's punitive expedition into Mexico against Pancho Villa, whose bandits had raided American territory, and subsequently Groninger put in three months at a camp in Texas.

In May 1917 the Pennsylvanian was advanced to captain and appointed instructor at the Plattsburg (New York) Barracks Officers' Training Camp. Near the end of November he was promoted to major (temporary) and sent to Fort Sill, Oklahoma, to teach at the School of Arms, where he served until June 1918. Next, with the United States in the First World War, the thirty-three-year-old Groninger was transferred to the War Department General Staff in Washington, and in September 1918 he went overseas, wearing the silver oak leaves of a lieutenant colonel, to join General Pershing's AEF staff. During the Meuse-Argonne offensive he served as machine gun officer of the Second ("Indian Head") Division and from November to December in the Third Division, which won itself the nickname "The Rock of the Marne." After the surrender of Germany Colonel Groninger remained on the General Staff of the Army of Occupation in Germany.

In January 1919 Groninger returned to Washington and the War Department General Staff, serving also on the Small Arms and Machine Gun Board. In March 1920 he reverted to the permanent rank of captain, and three months later was promoted to major. From July 1921 to January 1922 he worked in the Office of the Chief of Cavalry, after which he went to the Cavalry School (Fort Riley, Kansas), graduating in June 1922. Then he entered the Command and General Staff School at Fort Leavenworth, Kansas, the second highest Army school. He had done some intermittent studying there from 1918 to 1922, and finished the course with distinction in 1923. In September the Major began a two-year tour of duty at the Cavalry School as instructor in tactics. After study at the Army War College in Washington, D.C., which gives the highest Army training, he was graduated in August 1926 and assigned to the faculty of West Point, where he spent four years.

Next came five years' teaching at the Command and General Staff School, during which Groninger was promoted to lieutenant colonel. In May 1935 the Pennsylvanian reported to Harrisburg, in his home state, as instructor of the Fifty-second Cavalry Brigade, Pennsylvania National Guard. In June 1938, as a colonel, Groninger was given a field command —the Eleventh Cavalry, stationed at the Presidio of Monterey—and in October 1940, when the Second World War was still in its European phase, the fifty-six-year-old cavalryman was made a brigadier general (temporary) and assigned to command the port of embarkation at Brooklyn, New York. He thus wore the stars of a general before such better-known leaders as Patton '43, Clark '42, Spaatz '42, and Eisenhower '42.

When General Groninger assumed command the New York POE consisted of one installation at the Brooklyn Army Base, and a "handful" (about 2,500) of military and civilian employees. Shortly after the Japanese attacked Pearl Harbor he was able to dispatch to the South Pacific an emergency mission of some 33,500 troops. POE activities were shrouded in secrecy "except," as one British naval commander put it, "for the two million New Yorkers who saw us from their office windows and kept quiet about it"; but it was later revealed that in four years Groninger built up his command to twenty times the number of men and women workers, handling the most extensive port of its kind in the world. It grew from the one original installation to "a massive array" including seven major port terminals, shipping centers scattered over a fifty-mile area in Brooklyn, Staten Island, Manhattan, and Queens, the New York Army Post Office, and three "staging areas" in New York and New Jersey, including the two largest in the world, Camps Kilmer and Shanks. Groninger's command also included "a massive network of rail lines, highways, waterways, piers, ships, and storage houses, all of them linked together so that operations could be maintained in the face of any possible catastrophe of nature or enemy action." By September 1944 cargo tonnage handled had risen to sixty-two times the amount of September 1940, and passengers were multiplied by thirty-five.

In the First World War, to quote Representative James W. Wadsworth '43, "freight bottlenecks developed at New York. Freight cars crammed with precious matériel were backed up far inland, lying idle. Troops sent to New York for embarkation sometimes languished in the area for weeks until the shipping was available for their transport. In this war there have been no delays and no traffic bottlenecks, despite the far greater volume of movement. This marvelous record is a tribute to the Army Transportation Corps, the largest transportation agency in the world, which operates the New York port and all other ports of embarkation for the Army." The port was considered by its commanders to be in the first line of the war, as it filled the requisitions of theater commanders and maintained certain supplies at an automatic level, to make possible the Army boast of having the best-clothed, best-fed, and best-armed troops in the world. Perhaps the most dramatic filling of a requisition was in 1942, when a cargo ship was loaded with tanks and raced around the Cape of Good Hope and up the Red Sea to British Marshal Montgomery '42 in time to help him smash German Marshal Rommel's '42 Afrika Korps at El Alamein. The men and matériel remained officially under Groninger's command, through transport skippers and cargo security officers, until delivery. Altogether, 63,411,551 measurement tons of cargo were shipped from December 1941 through April 1945 to commanders in the entire Atlantic theater of operations; sending out bombers from bases in England; fighting in North Africa, Sicily, Italy, France, Luxembourg, Belgium, Holland, Germany.

Ninety-one per cent of all American troops in the North African and European campaigns passed through the New York POE—a total of 3,080,355 individuals from December 1941 through April 1945. At the staging areas they were housed while each soldier and all his equipment were thoroughly inspected, a routine involving checking of everything from teeth to watches, issuing of new equipment and an anti-gas outfit, and inoculations against diseases. These camps were also a huge school, with courses in subjects like abandoning ship, and a legal, business, and insurance office to handle personal problems for the outgoing troops. As part of General Groninger's program to "send them to Eisenhower in better shape than when they came to us," he established a unique school, soon dubbed "the GI Jam Session," at which about four successive groups a day were taught, in a one-hour session, how to entertain a GI audience in the inevitable waiting periods. According to Sergeant Robert Lieb's description in *Liberty*, the idea was a brilliant success. "Boredom among our troops is nearly as damaging as bullets," said the General, who emphasizes the importance of sports, "and if a soldier sticks a baseball glove or a football in his barracks-bag and smuggles it overseas, more power to him! We'll never court-martial him for it."

Despite the size of these operations, effective secrecy was maintained. For many months, in fact, Groninger was not allowed to tell where he was stationed; and it was not until June 1945, when the General was relieved of his New York command, that the facts were released. Groninger, who had been given a second star in August 1942, then exchanged jobs with Major General Clarence H. Kells, commanding general of the San Francisco POE, as the emphasis shifted from an Atlantic to a Pacific war. Before leaving, how-

GRONINGER, HOMER M.—*Continued*

ever, he arranged to have the Statue of Liberty relighted on nights when troop transports entered New York Harbor, so as not to disappoint veterans eager for a glimpse of the famous symbol. Mayor Fiorello H. La Guardia '40 presented Groninger with New York City's certificate of distinguished service before he left to begin the task of staging the invasion of Japan. Before the lapse of two months, however, the tide had turned, and Japan's surrender converted San Francisco almost entirely into a port of disembarkation.

Homer M. Groninger is described by the artist-correspondent S. J. Woolf as "a general who can swear like a trooper and pray like a chaplain, a man who can be as tough as a top sergeant and as tender as a woman. . . .a tall, broad-shouldered, heavy-set, balding man with light blue eyes in which a gleam of humor seems to lurk." Others mention his "ready tongue and keen wit." He has no taste for fiction or for heavy drama, but likes to see an amusing movie every two or three months and to read history. The General has no preference in smoking—he likes cigars, cigarettes, and a pipe; he is still a baseball fan, although his own playing has been confined to softball for a number of years; and he likes to fish. He has never played bridge, and is saving that for the day when he retires to the farm where he was born. He still reads the Port Royal weekly newspaper, which arrives addressed to Lieutenant Groninger—in almost thirty years the General has not bothered to change his listing.

GROVES, LESLIE R(ICHARD) Aug. 17, 1896- United States Army officer

Address: b. War Department, Washington, D.C.

The explosion of one small bomb over the Japanese city of Hiroshima on August 5, 1945, ushered in for the Allies the last phase of the war against the enemy, and for the world the beginning of the Atomic Age. The invention of this bomb, the result of man's experiments in atom-smashing, cannot be attributed to any one person. Its history is one of research, planning, and production that involved thousands of men and years of work. In the last phase of its development, however, there were a few persons who were assigned special parts in the task. One of these was Brigadier General Leslie R. Groves, who headed the division of the United States War Department directing the production.

The son of Leslie Richard and Gwen (Griffith) Groves, Leslie Richard Groves was born August 17, 1896, in the manse of the First Presbyterian Church in Albany, New York, where his father was a minister. While Leslie was still a baby the Reverend Groves became an Army chaplain, and consequently for a time the family lived at Army posts all over the country, wherever the father happened to be stationed. At seventeen the youth entered the University of Washington, but after a year he transferred to the Massachusetts Institute of Technology, where he remained for two years. At the end of this time he received an appointment to the United States Military Academy. At West Point young Groves was second-string center on the football team, and in 1918 he was graduated fourth in his class and commissioned a second lieutenant in the Corps of Engineers.

The twenty-two-year-old lieutenant was first sent to the Engineer School at Camp A. A. Humphreys, Virginia. After a year, in June 1919, he was sent to France with the American Expeditionary Force for a three months' observation tour; in September he returned to the Engineer School as a student officer. The following June he left the school again, this time to serve as the commander of a company in the Seventh Engineers. February 1921 found him back at the school once more, and in July he was graduated, having completed both the basic and the civil engineering courses.

From July 1921 until November 1922, when with the Third Engineers he was ordered to a tour of duty in Hawaii, Lieutenant Groves served with various engineering groups, at Camp Lewis and Fort Worden in Washington, and in San Francisco. He returned to the United States from Hawaii in 1925, and for the next two years he was assistant to the district engineer at Galveston, Texas. From 1927 to 1929 he was a member of the First Engineers, and as such was stationed successively at Fort DuPont, Delaware, Fort Ethan Allen, Vermont, and then again at Fort DuPont. When in October 1929 the Engineers were sent to Nicaragua for survey work on the proposed Nicaraguan interoceanic canal, Groves commanded a company from his regiment; subsequently he was awarded the Nicaraguan Medal of Merit for his work there.

When the Lieutenant returned to the United States in 1931 he was assigned to the Office of the Chief of Engineers in Washington, D.C., where he became chief of the Supply Section. It was while he held this post that he received his promotion to captain, in October 1934. A year later he left Washington for Kansas, to enroll in the Command and General Staff School at Fort Leavenworth. Upon graduation in June 1936 he was assigned as assistant to the division engineer of the Missouri River Division at Kansas City, Missouri, but September 1938 found him in Washington, receiving training at the Army War College.

Groves, after graduation the following summer, remained in Washington for service in the Operations and Training Division of the War Department General Staff. In July of 1940 he was promoted to major, and the following November, when he was raised to colonel (temporary), he was made a special assistant to Major General Edmund B. Gregory '45, the Quartermaster General. When the Army construction program was transferred to the Corps of Engineers, Groves became a special assistant in General Eugene Reybold's '45 Office of the Chief of Engineers. In the capacity of deputy chief of Army construction, he assisted in the supervision of all military construction in the United States, work which totaled six hundred million dollars a month. Part of his job consisted of supervising the erection of the huge Pentagon across the Potomac from Washington. Grove's biggest assignment came in the summer of 1942, when he was made head of what was known for purposes of secrecy as the Manhattan Engineer District, the division of the War Department, it is known now, that was responsible for the production of the atomic bomb. The Colonel became a brigadier general (temporary) in September of that year, and a lieutenant colonel (permanent) in December 1942.

For years such world-renowned scientists as Niels Bohr '45, Sir James Chadwick '45, Enrico Fermi '45, and E. O. Lawrence '40 had been working on the problem of utilizing the tremendous force locked within the atom. Just before the Second World War began, the research in this field of atom fission—which is the principle upon which the atomic bomb works—was given immediate impetus by Lise Meitner '45, a woman scientist in Germany, who discovered that something that had previously seemed inexplicable was really an explosion of the atoms of metal uranium. (Uranium is a lustrous white metal that comes from pitchblende or carnotite.) At this point Miss Meitner left Germany for neutral Sweden and there released the news of her astounding discovery. Both Allied and Nazi scientists realized to what ends this information would lead—and the race was on to find the last steps in smashing the atom.

In the United States late in 1939, President Roosevelt '42 appointed a commission to investigate the problem and the possible use of atomic energy for military purposes. Until then only small-scale research with Navy funds had taken place. In two years' time the project was put under the direction of a group of eminent American scientists headed by Vannevar Bush '40, and turned over to a general policy group, including men like Henry A. Wallace '40, James B. Conant of Harvard '41, and Henry L. Stimson '40. British-American cooperation on the project was formally begun in October 1941. The following June it was decided to expand the work under the direction of the War Department, and it was then that Groves was called in to take complete executive charge. (He was made a major general [temporary] in December 1944.)

A complete city soon grew up around each plant. Oak Ridge, for example, ten miles from Knoxville in Tennessee, grew from almost nothing to the fifth largest city in the state. In 1943 a combined policy committee of English, American, and Canadian scientists was appointed to facilitate cooperation among the three countries. This was all done under the strictest secrecy. Only those people to whom it was essential that they know were informed of what was happening; even Groves's wife had no idea of what her husband was engaged in. The reports to Stimson had to be kept so secret that Groves used to deliver them orally to the Secretary of War.

When victory came in Europe in May 1945 the nerve-racking race came to an end, but, although the Germans were out of the running, the scientists in the United States did not slacken their pace. Finally, on July 16, 1945, the long-awaited solution was ready for the secret test. In New Mexico, near the special laboratory set up under the direction of J. Robert Oppenheimer '45, theoretical physicist at the University of California, a speculative theory was projected into practicality as the test of the first atomic bomb succeeded almost beyond belief. According to the War Department release, those few who witnessed the shattering results felt that they "had been present at the birth of a new age—the Age of Atomic Energy." And they recognized, too, their "profound responsibility to help in guiding into right channels the tremendous forces which had been unlocked for the first time in history."

U. S. Army Signal Corps

BRIG. GEN. LESLIE R. GROVES

But the immediate purpose toward which Groves and the men under him had worked for three years had not yet been accomplished —the use of the bomb to hasten the end of the war. On the twenty-first day of the Atomic Age, therefore, August 5, an American B-29 dropped the first bomb on the enemy, on the Japanese city of Hiroshima. The next day President Truman '45 broke the news of the bombing to the public, which thereby learned for the first time of the release of a new force in the world. The effect of the power behind this force was demonstrated even more emphatically only a short time later, for on August 14, five days after a second bomb had been dropped on the city of Nagasaki, Japan surrendered unconditionally.

An interim committee was immediately provided to investigate the possibilities of the peacetime use of atomic energy, and to study postwar control of this force, for everyone realized that this phenomenal discovery has significance far beyond immediate comprehension, significance which shall depend upon what man chooses to make of man. The New York *Times* editorial comment on August 7, the day after the public announcement of the great discovery, was, in part: "A revolution in science and a revolution in warfare have occurred on the same day. . . .Civilization and humanity can now survive only if there is a revolution in mankind's political thinking."

GROVES, LESLIE R.—*Continued*

The subject of the development, use, and control of atomic energy continued to be widely discussed by the public, press, scientists, the military, and the national legislators during the remaining months of 1945. While the scientists pressed for the sharing of the secret and for world control, the Truman-Attlee-King meeting resulted in the Presidential announcement of their joint decision to share the bomb secret with other United Nations "just as soon as effective enforceable safeguards against its use for destructive purposes can be devised." Senator Ball introduced a bill to create a nine-man control commission, to include the Secretaries of War, Navy, State, Interior, and Commerce, which would set up three advisory boards for research, industrial, and military application of atomic energy. Late in October the Senate Committee on Atomic Energy was established as Congress looked forward to months of discussion on resolutions and bills. Groves himself appeared before the Senate Committee and also spoke publicly on the subject. It was his stand that "this weapon must be kept under the control of the United States until all of the other nations of the world are as anxious for peace as we are." He approved of the Truman-Attlee-King approach to the problem and envisioned the use of atomic energy in industry and medicine. In October Groves was promoted to Brigadier General (permanent) and nominated as assistant to the Army Chief of Engineers. The year closed with the setting up of a joint Army-Navy advisory to work with Groves.

The War Department has commended Groves highly for his performance in "securing the effective development" of the bomb in so short a period of time, and for his organization of an airtight security system. The General has been praised, too, for the job he did in organizing into an efficient working unity all the organizations and forces at work on the vast project. Groves himself has expressed appreciation for the cooperation he has received from scientists and technicians, A.F. of L. and CIO unions, who "in many cases buried jurisdictional difficulties of long standing so that work might be completed on schedule," contractors and industrialists, all of whom were essential to the successful execution of this two-billion-dollar enterprise. Happy over the success of the project, he has called the atomic bomb, according to a report in the New York *Herald Tribune*, a two-billion-dollar calculated risk which paid off. He said that some of the usual engineering procedures had had to be abandoned in the course of production, but that progress was made "through determination and the willingness to take a chance." Groves and a number of others were given Distinguished Service Medals or Distinguished Civilian Service Awards for achievements of "unfathomable importance to the future of the world" for their work in connection with the development of the atomic bomb. By the end of 1945 Hollywood was planning to record the history of the atomic bomb on celluloid, in which the role of General Groves might be played by Clark Gable '45.

The General and Mrs. Groves, the former Grace Hulbert Wilson, to whom he has been married since 1922, have two children: Gwen who in 1945 was at the National Catholic School for Girls in Washington, D.C., where the family makes its home, and Richard, who was graduated from West Point in June of 1945. The Lieutenant was assigned to Fort Belvoir, an engineering establishment in Virginia, the same post to which his father was assigned twenty-seven years before. Groves, whose organizing ability made possible the production of the atomic bomb, has been described as a heavy-set man, slightly under six feet in height, soft-spoken, and genial. A football player at West Point, he is still an athlete; his favorite sport, according to Mrs. Groves, is tennis, but for three years the General was kept too busy to find time for even one game.

Who's Who in America, 1944-45

GRUMMAN, LEROY R(ANDLE) (grŭm′ m*ă*n) Jan. 4, 1895- Industrialist

Address: b. Grumman Aircraft Engineering Corp., Bethpage, Long Island, N.Y.; h. 77 Bayview Rd., Plandome, Long Island, N.Y.

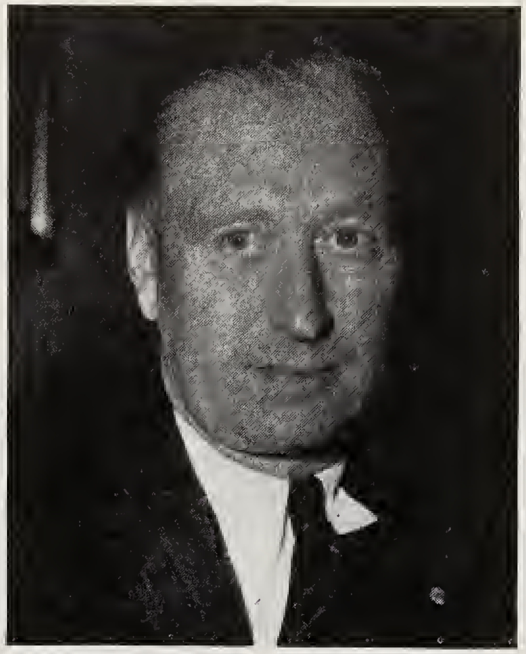
When Rear Admiral John H. Towers in 1942 presented to the Grumman Aircraft Engineering Corporation its first Navy E, the first Navy E awarded in the industry, he told the Grumman employees: "Practically every airplane you turn out goes to an active combat area immediately. . . .Your products have been speaking for themselves." And Vice-Admiral John McCain '43 has said: "The name Grumman on a plane or a part is like sterling on silver." Aircraft planner and designer of the Wildcat, Hellcat, and Avenger planes, and reputed financial genius of the company, is its president, Leroy R. Grumman. In a decade and a half he has directed the corporation's growth from a plane repair shop employing sixteen persons to an industrial plant with twenty thousand employees who not only maintain the quantity and quality of their production but have a record of no strikes and very little absenteeism. On the strength of past performance, observers predict an important postwar future for Grumman.

Leroy Randle Grumman was born on January 4, 1895, in Huntington, Long Island. The family of his father, George Tyson Grumman, (according to Francis Sill Wickware in the *Saturday Evening Post*) generations earlier had given its name to the village of Grumman Hill, near Wilton, Connecticut. The elder Grumman was a carriage shop owner; his wife was the former Grace Ethel Conklin. Roy attended the Huntington High School, from which he was graduated in June 1911, the second highest in his class. Already interested in the technological developments in airplanes, he discussed the future of the then infant industry in his salutatorian address at the commencement exercises. Then continuing his education at Cornell, Grumman specialized in engineering, graduating in 1916.

He obtained his first job in the engineering department of the New York Telephone Company. When the United States entered the First World War in 1917 Grumman became a mechanics mate in the Navy and was sent for special instruction to Columbia University. Learning to fly at Miami and Pensacola in the first months of 1918, he was promoted to the rank of ensign and assigned as a pilot instructor to the Naval Air Training Station at Pensacola. In 1919, after a second special course, taken at Massachusetts Institute of Technology, he was transferred to the Naval Aircraft Factory in Philadelphia as a test pilot and engineer. In 1920 he was retired as a lieutenant, junior grade, to the United States Naval Reserve. The experience thus gained enabled him in 1920 to obtain the position of general manager and aeronautical engineer with the Loening Aeronautical Engineering Corporation of New York. For the succeeding nine years Grumman remained with Loening.

In 1929, however, when mergers between aircraft firms were becoming increasingly frequent, the Loening Company announced its intention of combining with Keystone Aircraft, and Grumman found himself confronted with the alternative of accepting a less responsible position in the new company or looking for another job. He decided to go into business for himself, with Leon A ("Jake") Swirbul, factory manager at Loening and now Grumman's vice-president and production manager, and William T. Schwendler, a rising young engineer at Grumman Aircraft, as partners. On December 6, 1929, they established the Grumman Aircraft Engineering Corporation with a capitalization of thirty-two thousand dollars, of which Grumman himself contributed approximately seventeen thousand. On January 2, 1930, the three young men opened their shop for the repair of airplanes (especially the Loening "Air Yachts" which rich private owners were always wrecking and which Loening was no longer servicing) in a converted garage in Baldwin, Long Island. Their first repair job threatened to be their last—a motorist, crashing into the projecting nose of an amphibian plane too large to fit into the workshop, threatened suit. But the matter was adjusted when Grumman agreed to repair the car, and Grumman Aircraft was started on the road to success.

Besides Grumman, Swirbul, Schwendler, and two others on the office staff, the new company employed sixteen men in its shop. As its reputation spread, work began to come in from all over the country, with Pan American-Grace Airways even shipping a plane all the way from Panama to be repaired. Luck, too, aided the new enterprise when an insurance agent unfamiliar with aircraft allowed Grumman and Swirbul to buy a wrecked plane for four hundred dollars which they were able to sell for twenty-one thousand dollars after replacing the motor and repairing the fuselage. When work was slack, as at the end of 1930, Grumman turned to other fields for employment, teaming up with C. S. Lyon's Motor Haulage Corporation to produce a lightweight but strong truck body for use on standard chassis, and a chassis-less trailer for trucks. Before the end of 1930 Grumman had also begun work on a monocoque aluminum float with a unique retractable landing gear which was to convert Navy scout planes into amphibians. Although the Navy ordered two floats merely from the plans, it afterward balked when Navy engineers reported their inability to calculate the stresses of the revolutionary design, admitting that they were unable to determine whether the float could withstand the shock of a catapult launching. Not to be daunted, Grumman and Swirbul took their seats behind a Navy pilot in a float-equipped plane, were catapulted from the deck of a battleship, and proved their point. A Navy contract for eight resulted.



LEROY R. GRUMMAN

Having conquered the first hurdle of manufacturing, Grumman redesigned his float and added an arresting landing gear to facilitate landing on a limited area such as a carrier deck. The Navy responded with an order for fifteen. The success of the retracting gear on both models of the amphibian float suggested to Grumman the employment of similar gear construction on a military airplane. Conservative Navy men rejected the improvement, because expert opinion up to that time had considered the advantages of the mechanism offset by the disadvantages of extra weight and complexity of construction. Grumman found, however, that the Bureau of Aeronautics was interested, and, on the strength of its encouragement, he moved his factory to a larger building at Valley Stream, Long Island, to begin work on a fighter plane embodying his new landing gear principle. The XFF-1, the ancestor of all Grumman planes, was delivered to the Navy at the end of December 1931. The craft's performance and remarkable speed, a convincing demonstration of Grumman's theories, won an immediate Navy contract and started Grumman on his career as plane builder for the United States Navy.

The following years were occupied with the improvement and modification of the XFF-1 and the amphibian floats. Expanding production forced Grumman in 1932 to move to still larger quarters at Farmingdale, Long Island.

(Continued next page)

GRUMMAN, LEROY R.—*Continued*

Here the company specialized in building fighter and utility ships for the Navy, and developed "the stubby, teardrop-shaped fuselage that has become a virtual Grumman trade-mark." When the boom tapered off in the middle thirties Grumman placed in production two amphibians for private and commercial use, the G-21 selling for sixty thousand dollars and the smaller Widgeon selling for twenty-eight thousand. Owners soon included Marshall Field '41, Henry S. Morgan, Robert R. McCormick '42, and Lord Beaverbrook '40. So successful were these planes in navigating the inaccessible Georgia bayous and mountain fastnesses for oil companies and others that the Navy and the Army, too, were soon purchasing them. By 1937 lack of ready cash to complete the large number of orders on the books almost bankrupted the corporation, but the offer of a stock issue to the general public, underwritten in part by Bernard E. Smith, a Wall Street financier who wanted to buy an amphibian, averted the disaster.

When the Japanese attacked Pearl Harbor, Grumman, who had already been supplying the Navy with Wildcat carrier fighters for some time, swung into production on a large scale at his new plant at Bethpage, also on Long Island. While other manufacturers were still arguing over alterations in design, he consulted William S. Knudsen '40, then director of the Office of Production Management, froze his designs, and began to build planes wherever he could find space to convert into assembly lines. Wildcats quickly set records in the battle of the Pacific and, rechristened Martlets, for Britain in the Mediterranean, thus refuting the myth of the inferiority of carrier fighting planes to land-based fighters that was once presented by experts to Grumman as a basis for slighting quality on the former. Always interested in the improvement of his planes, Grumman soon perfected a folding wing, now installed on all his carrier planes, which made possible a 50 per cent increase in carrier capacity. (*Time* reports that, in his usual informal manner of working, Grumman worked out the construction principle by manipulating paper clips stuck into either side of an eraser.)

When Navy pilots reported trouble with Japanese Zeros, Grumman sent Swirbul to the Pacific for information and to the pilots' stipulations constructed the Hellcat to outdistance, outclimb, and outfight the Japanese plane. Says Grumman of the Hellcat—the first plane to be designed from pilots' specifications, the first to be produced in quantity before a test flight had been made, and a plane which set production records in the speed with which it was translated from blueprint to assembly line—"It is not right to think of the Hellcat as a sort of big brother of the Wildcat. It is a new plane, bigger, faster, more maneuverable." A Navy captain has called it "the answer to a fighter pilot's dream . . . the hottest thing in the air." Besides the Hellcat, which has superseded the Wildcat, Grumman has in production a torpedo bomber, the Avenger, design of which was begun in 1936 when experts predicted that the day of the fighter plane was over. Construction started in 1939, but the present Avengers owe their perfection to discussions with British military authorities after outmoded British Swordfish torpedo planes defeating the Italian Fleet at Taranto demonstrated the value of this newest weapon.

Production world records for these Grumman planes are said to be due to Grumman employment policies. (Grumman Aircraft was "the first plant to produce ten thousand planes of one model, designed and built after December 7, 1941"; and in one month, March 1945, completed 605 planes, 105 above its quota.) Swirbul and Grumman have found that it pays to hire local people instead of erecting temporary, barracks-like living quarters; and that employees will remain on the job if they are provided with satisfactory working conditions, an incentive wage plan, and recreation facilities; if they are able to consult the boss directly (Grumman's employees wander in and out of his office at will); and if their worries are mitigated by child-care nurseries and a little green emergency truck which can be sent to turn off a forgotten gas jet or to rescue a stranded motorist.

Immediately after V-J Day Grumman stopped production on the Hellcat and laid off its twenty-two thousand workers, then hired some five thousand back to work on pursuit models for the Navy; he plans to go into production of amphibians for private use. He has joined with other airplane manufacturers in urging a broad Government research program. In spite of reconversion problems, Grumman announced on October 27, 1945, that the company had just put into effect a new employee retirement plan, retroactive for five years prior to January 1, 1943, for which the company assumed all costs; at the same time the company carries group insurance for all employees, regardless of age or length of service.

Roy Grumman, as he is generally known, is described as a quiet, reflective small-town man who dislikes big cities—"pure counterpoint to the gusty Swirbul." He is reticent not only about himself but also about the company, declining to advertise, for instance, until his schoolboy son complained that no one had heard of his father's airplanes. Like Swirbul, however, he is informal and, according to *Time*, works in his shirtsleeves, often with his feet on the desk, in an office which he shares with his lieutenant. If the office becomes too crowded with workers, Grumman and Swirbul move into a second office, from the ceiling of which hang hundreds of model airplanes.

At home in the evenings—his white seventeen-room house with blue shutters overlooks Long Island Sound—Grumman reads, or he visits neighbors with Mrs. Grumman. He and Mrs. Grumman, the former Rose Marion Werther, to whom he was married in March 1921, have four children: Marion Elinor, Florence Werther, Grace Caroline, and David Leroy. Of medium height, Grumman is somewhat stoop-shouldered, has blue eyes and sandy hair, and a New England twang in his voice. He is a Presbyterian, and belongs to the North Hempstead Country Club, the Manhasset Bay Yacht Club, and the Hicksville Aviation Country Club. He is a Fellow of the Institute of Aeronautical Sciences and a member of the Society of Automotive Engineers. Grumman still likes to fly. "When you're alone five thousand feet in the air," he says, "lots of things about a plane become important that you can overlook on the ground."

GULICK, LUTHER (HALSEY) (gū′lĭk) Jan. 17, 1892- United States Government official

Address: b. Institute of Public Administration, 684 Park Ave., New York City; h. 14 Sussex Ave., Bronxville, N.Y.

As director of the Institute of Public Administration, whose function is to render expert technical advice to governments, Luther Gulick is ranked by his colleagues as one of the top men in his field. His study of the New York State educational system and his work as a tax authority are also well known. Because of his special abilities in these fields, since 1941 Gulick has held important posts in various Federal Government war agencies.

Born in Osaka, Japan, January 17, 1892, Luther Halsey Gulick is one of the five children of Dr. Sidney Lewis and Cara M. (Fisher) Gulick. Because his father, an educator and missionary, was born in the Marshall Islands and his missionary grandfather in Hawaii, Gulick has to go back to his great-grandfather (also an educator) to find an American-born paternal ancestor. Before the outbreak of the Second World War members of the Gulick family were active in missionary work in Japan, China, India, Turkey, Iran, and Spain.

During his boyhood in Japan Gulick's education was acquired largely through tutors and from his parents. He later attended public schools in California and, for one year, in Germany. After his graduation from the Hotchkiss Preparatory School, he entered Oberlin College, where he received his B.A. in 1914. As an Oberlin undergraduate he was called "a fresh kid—talkative, boasting, energetic." He was an excellent student, staying on at Oberlin to take his master's degree in political science in 1915. (In 1939 Oberlin awarded him a Litt. D.) He then went to Columbia University to become a student of Professor Charles A. Beard's [’41], and participated (1915-17) in the Training School for Public Service of the New York Bureau of Municipal Research, of which Beard was then director. The courses consisted of laboratory work in public administration, affording Gulick a good deal of experience in the tax, police, fire, street cleaning, and other city departments.

LUTHER GULICK

With the outbreak of the First World War Gulick left Columbia to do statistical work for the Council of National Defense. Later he transferred to the War Department, becoming a captain in the statistical branch of the General Staff. After the war he returned to Columbia, where he received his doctor of philosophy degree in 1920.

In the early 'twenties Gulick taught classes in public administration at Columbia, and also became a staff member of the New York Bureau of Municipal Research, a private organization. He later became director of the bureau, which was renamed the Institute of Public Administration, in the service of which he currently continues as director. The Institute of Public Administration furnishes technical assistance to legislative commissions, tax departments, and the general administrations of state and local governments. At the time when Calvin Coolidge was Governor of Massachusetts it was Gulick who, as secretary of the joint special committee on the budget, helped Coolidge organize the Massachusetts budget system. Gulick was later called upon to work on the finances of other states, and he took part in several other reorganization studies with the staff of Bureau of Municipal Research. During these years he also lectured at various colleges, becoming Eaton Professor of Municipal Science and Administration of Columbia, and delivering special courses of lectures at Union College (1928-29), subsequently at the Universities of Buffalo, Chicago, and Pennsylvania. In 1933 he was Dodge Lecturer at Yale. His work in public administration thus functioned in two ways: through his own experiences in municipal research he was able to guide the academicians toward practical approaches to their studies; at the same time he brought to the public administrators themselves the theory and learning of the college professors.

(Continued next page)

GULICK, LUTHER—*Continued*

Gulick's first work of national importance began in 1933 when he was made the director of the Commission of Inquiry on Public Service Personnel, appointed by the Social Science Research Council. After a thorough investigation, his committee in 1935 submitted a seven-volume report of its findings. In an article in *Survey* for February 1935, Gulick discussed the major aspects of the situation. The Commission of Inquiry on Public Service Personnel had discovered that the most intelligent and ablest people do not go into government service. The situation exists, said Gulick, largely because of "the spoils system, the use of public payrolls for charity, and undiscriminating criticism of public employees." Gulick and his assistants recommended that the Government put the civil service on a career basis, recruiting young men and young women on the basis of capacity and providing for their advancement. It is said that many improvements in the Civil Service since 1937 have been due to this study on service personnel.

Having become increasingly active in the field of education, Gulick, as director of the Regents' Inquiry, began in 1935 a four-year study of the public school system of New York State. The findings and recommendations, published in eleven volumes, were considered "the most comprehensive study of an educational system ever made." For his share in it Gulick was awarded the Butler Medal by Columbia University in 1939, an award given annually to degree-holders of the university for the outstanding piece of work of the year. As a result of this survey Gulick was also offered more than one college presidency, but these offers he declined.

In "A New Hope for Education" (*Atlantic Monthly,* April 1939), Gulick described the investigations of the Regents' Inquiry Committee into the cost and character of education in New York State. Much of the school curriculum, he declared, was found to be outdated. Not enough was being done to provide adequate vocational education or knowledge of local government and civic problems. In his book *Education for American Life* (1938), Gulick recommended adding two more years to the high school course for those boys and girls who do not go into employment or to college. He would extend the preparation period of teachers and increase the salaries of rural teachers. He also recommended increased centralization of schools, a coordinator of adult education for every community, and increased student aid.

One of the most important undertakings of Gulick's career was his work on the President's Committee on Administrative Management, from 1936 to 1938. Serving on this committee with him were Louis Brownlow and Charles E. Merriam, together with a staff of specialists in government and administration. As early as 1933 Gulick had set forth his theory of taking politics out of administration: "The Government is becoming and is apparently destined to remain, at least to a degree, the super-holding company of the economic life of the Nation. The fundamental new function which government assumes in this process is that of devising and imposing a consistent master plan of national life. This will require a new division of actual work and therefore a new theory of the division of powers . . . concerned not with checks and balances or with the division of policy and administration, but with the division between policy veto on one side and policy planning and execution on the other."

The investigation of the Committee on Administrative Management became the basis of President Roosevelt's '42 reorganization of the administrative branches of the Federal Government. In his article "Making Democracy Work" (*Survey Graphic,* March 1937), Gulick reported that, for purposes of management, "boards and commissions have turned out to be failures. . . .Real efficiency must be built into the structure of a government just as it is built into a piece of machinery."

Among other measures the committee recommended were: (1) expansion of the White House staff by the addition of a number of administrative assistants to the President; (2) strengthening of the managerial agencies of the Government; (3) inclusion of independent agencies within the twelve major Executive departments; (4) establishment of the accountability of the Executive to Congress by the provision of a genuine independent post-audit of all fiscal transactions by an auditor-general. Of the committee program, Walter Lippmann '40 wrote: "It is a great document not because all of its specific proposals are necessarily great or wise or even well considered, but because the report has raised with such understanding, and would begin to remedy with such courage, the really great difficulties which have developed in the operation of the Government over a period of a hundred years."

Early in 1941 Gulick became a consultant on post-defense planning for the National Resources Planning Board. It was in this connection that he, with Professor Alvin Hansen '45 of Harvard, represented the United States at the International Conference on Science and the World Order held in London in September 1941. At this congress the problems of postwar reconstruction in the light of science were discussed. Afterward Gulick remained in England for three weeks to study special aspects of postwar planning. On his return home he stated his belief that "the most specific need in the postwar period in this country, whether you are optimistic, pessimistic, or realistic, will be that of urban reconstruction and transportation."

The post-defense division of the NRPB published an eighteen-page pamphlet, *After Defense—What?* The report discussed transition to a peacetime economy without depression and unemployment; and it was predicted that it would be read and re-examined as "a signpost to a new world." Two basic facts were pointed out: first, that any expansion of the economy can absorb only a few million workers in any given year; second, that when peace comes the United States must find peacetime jobs for all its manpower, otherwise the country would be "back in the valley of the depression." The report said that in postwar years the national income should be maintained at a level of a hundred billion dollars. Full employment could be accomplished, the report stated, through encouragement of a public works program, the development of new products, the expansion of public services, new forms of social security, and an end to isolationism.

In the year of 1941 Gulick served as a special assistant to the Secretary of the Treasury, was a member of the United States Census Advisory Committee, and president of the Tax Research Foundation. At this time he was also an expert consultant to the Secretary of War, and assisted his friend General Brehon Somervell '42 on supply reorganization problems.

In May 1942 Donald Nelson '41, then head of the War Production Board, appointed Gulick to direct a permanent office of organizational planning as a step toward decentralizing the WPB. The functions of Gulick's office, said Nelson, would include a continuous study of the responsibilities and operation of the various units of WPB in an effort to reduce duplications and overlapping of functions. A further duty was to study methods of achieving decentralization in order to concentrate as much authority as possible in the local offices. Gulick called his WPB assignment "the most difficult Government job in the world," and said he expected to stay with it for the duration of the war.

But in January 1943 Nelson announced with regret the resignation of Gulick from the WPB. Gulick had a new post—this time as chief of the Program and Requirements Division of the Office of Foreign Relief and Rehabilitation under Herbert H. Lehman '43. He took a vigorous part in the organization of the United Nations Relief and Rehabilitation Administration, which he called "unique in the relief field." Its management, he said, "is sound, able, and humanitarian. The staff will be international and expert. The financing will be a joint world enterprise, of which our share at most will be a small fraction of what we are spending on the war." In an article, "Moscow, Atlantic City and Points Ahead" (*Survey Graphic*, December 1943), he wrote: "Don't let anybody tell you that the cost of rehabilitation is prohibitive. The truth is, the cost of any other policy is prohibitive. Relief without rehabilitation, in the economic shambles of present-day Europe, would cost five times as much as relief and rehabilitation together."

The Committee on Intergovernmental Fiscal Relations, consisting of Gulick and two professors of economics, Harold M. Groves of Wisconsin University, and Mabel Newcomer '44 of Vassar, submitted to Secretary Morgenthau '40 in March 1943 a plan for coordinating taxation in the three levels of government. It was called "a postwar fiscal system tailored to fit the new world envisioned by Roosevelt's National Resources Planning Board." The committee emphasized the need for the creation of a Federal-state fiscal authority to examine and suggest changes in the fiscal affairs which Federal, state, and local governments might well follow. The report, a six-volume work, contained sixty-nine recommendations, among the more important being: (1) Creation of a Federal-State fiscal authority; (2) public investment in such fields as public health, regional development, public housing, and nutrition to "underwrite the maintenance of a high level of economic opportunity and full use of resources and plant capacity in the United States"; (3) broadened Federal-aid programs to include relief and public education, and maintenance of minimum standards of educational opportunity: any Federal program should control the division of educational moneys between whites and Negroes; (4) broader social security coverage to include groups now uncovered; (5) broadened Federal-aid programs, extended to relief and public education, providing for differential grants aimed to achieve national minimum standards; (6) Federal incorporation of companies doing interstate business; and (7) adoption of a more progressive tax system and elimination of tax loopholes. The committee recommended taxation of present tax-exempt securities and a complete overhauling of the death and gift tax structures.

Gulick's primary intellectual contribution has been in the development of the analysis and theory of administration. As a definition of "administration" he coined the word "Posdcorb," which stands for planning, organizing, staffing, directing, coordinating, reporting, and budgeting; these, according to Gulick, are the functional elements of administration. Gulick developed these theories in his best-known book, *Papers on the Science of Administration* (edited with L. Urwick), parts of which have been translated into French, German, Portuguese, Russian, Chinese, and Japanese.

During 1944, besides working with the UNRRA, Gulick continued in his own special field of public administration. He worked on plans to reorganize the Foreign Economic Administration Agency and various other Federal activities. He took a leading part, early in 1945, in a series of conferences on education sponsored by the New York *Times* and the Public Education Association. With several other educators he contended that Federal aid was a vital necessity to schools. Late in 1945, Gulick was one of fourteen advisers who accompanied Edwin W. Pauley '45 to Japan to survey "the amount and nature of assets held by the Japanese which should be used as reparations."

In addition to his posts in the fields of education, taxation, and administration, Gulick has held several other correlating positions. Since 1940 he has been chairman of the Educational Committee of the Office of the Coordinator of Inter-American affairs. He has been a member of the Social Science Research Council, and of the Liquor Control Commission. He is also chairman of the American Film Center and of the Public Affairs Committee. On May 15, 1945, Gulick was chosen as one of the twenty-one experts to assist Edwin W. Pauley '45, head of the American representatives to the Reparations Commission.

Gulick was married in 1917 to Helen McKelvey Swift. Mrs. Gulick has always taken an active interest in her husband's work, and on occasion has been of official assistance to him: when he was called to duty by the WPB she took over his desk with the National Resources Planning Board. (The Gulicks have two sons, Clarence Swift and Luther Halsey; one served in the Navy, the other in the Army.) "Of medium height, mild appearance, and wearing silver-rimmed glasses, Gulick affects no flourishes, dislikes publicity and usually avoids it. He keeps clear of politics [he himself is a Republican] and policy-making." He is "a lover of modern music and painting, a

GULICK, LUTHER—*Continued*

rather bad tennis player, an amateur mechanic, and a confirmed hiker." It is said that he once climbed mountains in Switzerland and the Rockies. One of his recreations now, when not working in his office from eight in the morning till ten at night, is hiking about the woods near his Westchester County home.

HANSELL, HAYWOOD S(HEPHERD, JR.) Sept. 28, 1903- United States Army Air Force officer

Address: b. c/o War Department, Washington, D.C.; h. 401 Wiltshire Ave., San Antonio, Tex.

The combination of abilities which makes a military man outstanding both in planning strategically and in executing that strategy on the field is found in Brigadier General Haywood ("Possum") Hansell. As chief of staff of the new Twentieth United States Air Force, he helped plan the bombing system used against Japan by the Boeing B-29 Superfortresses; as commanding general of the Twenty-first Bomber Command, Twentieth Air Force, he directed the operations of the Saipan-based "flying castles" which bombed Japan until V-J Day.

A fifth-generation Army man of English descent, whose grandfather and great-grandfather had fought against the Union in the Civil War, Haywood Shepherd Hansell, Jr., was born September 28, 1903, in the antebellum officers' quarters of Fort Monroe, Virginia. His father, Colonel Haywood S. Hansell, was an Army surgeon; his mother, the former Susan Wilson of Atlanta, was a belle in the old Southern tradition. Young Haywood's first language, it is said, was Chinese, which he has since forgotten: He learned it from his amah while Colonel Hansell was on duty in China during the Boxer Rebellion. When that officer was transferred to the Philippines his three-year-old son started learning Spanish from his nurse, and it was not until then that his mother started to teach him English. This third language came in handy at the various Army posts where the Hansells lived after their return to the United States, and at Sewanee Military Academy, where Haywood was dubbed "Possum" for his alleged similarity to the opossum.

Nevertheless, in his senior year at Sewanee young Hansell was made captain of the cadet corps, and a very strict one he was—until his sudden demotion to buck private, the result of a sharp decline in grades. As a consequence, upon his graduation in 1920, he turned down an appointment to West Point in favor of studying mechanical engineering at Georgia School of Technology. At this time, says Sidney Shalett, the Possum's great ambition was to be a football player, although he barely tipped the scales at one hundred. However, Hansell recalls, "I had one of the most unusual football careers in the South. I played seven years without ever earning a letter. Neither at Sewanee nor Georgia Tech did I ever get off the bench in a major game." Graduated with his engineering degree in 1924, Hansell declined the offer of a second lieutenancy and rejoined his parents in San Francisco. In California the future General worked for the Steel Pipe and Tank Company at Berkeley as a helper, supplying his own tools out of wages of two dollars and sixty cents for a ten-hour day. After a year he was qualified as a journeyman boilermaker; after another year he was a draftsman and estimator; and in his fourth year Hansell was made chief engineer.

In February 1928 Hansell enrolled as a flying cadet, "just to learn something about planes so I could build them," he says. After training at March Field, California, and Kelly Field, Texas, he was graduated from the pursuit course with his wings in February 1929 and was commissioned a second lieutenant in the Air Reserves, entering active duty the following day. (His ratings are: command pilot, combat observer, and technical observer.) Three months later Hansell was given a commission in the Air Corps of the Regular Army and assigned to duty with the Second Bombardment Group at Langley Field, Virginia. While testing a P-12 fighter there one cold winter day, Lieutenant Hansell was forced to bail out over Chesapeake Bay; unable to wriggle out of his hastily adjusted parachute harness, he nearly drowned during the twenty minutes before he was rescued.

In September 1930, after three months' temporary duty with the Sixth Field Artillery at Fort Hoyle, Maryland, the twenty-seven-year-old Lieutenant returned to Langley Field as armament officer of the Air Corps Tactical School Detachment. He was sent to Maxwell Field, Alabama, in August 1931 for duty with the Fifty-first and later the Fifty-fourth School Squadrons as assistant operations officer. At this time Hansell was courting brunet Dorothy Rogers, a Texas belle whom he used to fly to Waco to visit. They were married in 1932, and have three children: Haywood, 3d (called "Tony"), Lucia, and Dennett, who, with their mother, live in San

Antonio, in which city the elder Hansells also have their home.

During this period, too, Hansell, a "hot pilot," joined Captain Claire Chennault '42 and Lieutenant Luke Williamson (Lieutenant William McDonald was alternate) to form the "Three Men on a Flying Trapeze," a team of aerobats who represented the Army Air Corps at the Cleveland National Air Races in September 1934. Chennault, with the daring ingenuity later to make him famous as head of the Flying Tigers, "used to sit up nights thinking up things that absolutely could not be done with an airplane; then he would take his team out next day and they would do them"—in perfect formation. "If we had kept at it long enough," General Hansell now says sedately, "we certainly all would have been killed."

"The only [other] thing that distinguished the pint-sized Lieutenant in those days," according to Shalett, "was the fact that he was the only shavetail at Maxwell who had a complete set of dress blues"—and those were thirty years old. But Lieutenant Colonel Harold L. George '42 was "immediately impressed that here was a man with a broad understanding of the proper utilization of air power—something not too many people had in those days." So George went to his friend Major Carl ("Tooey") Spaatz '42, who was in charge of tactical instruction, and got young Hansell assigned to study tactics and strategy under him (George) at the school from July 1934 to June 1935. In October 1934, nearly six years after his commissioning, Hansell was promoted to first lieutenant—par for the course in those depression days. On graduation he was appointed an instructor, one of the youngest at the school; his subject was called "air force." Here the officer distinguished himself at polo, tennis, and squash, as a tireless dancer, a tuneless baritone, and "the unofficial poet laureate of the Air Corps." A songbook published in 1937 by the Daedalians, an Army fliers' social group, boasts Hansell as the author of half its lyrics.

After three years the thirty-five-year-old Lieutenant was sent to the Command and General Staff School at Fort Leavenworth, Kansas, for advanced training. After his graduation in June 1939 Hansell was ordered to Washington, D. C., where he became assistant executive officer in the Office of the Chief of Air Corps. Then Colonel George discovered that "for some damn reason he doesn't know" his protégé was doing public relations work, and "yanked him back into planning, where he belonged." In November 1939, therefore, Captain Hansell (he had been promoted that May) was transferred to the Air Force Intelligence Division, and in July 1940 was made chief of the Foreign Intelligence Section's Operations Planning Branch. In March 1941 he was promoted to major (temporary), and in July he was sent to London as special observer to report on the air blitz.

In August 1941 Hansell returned to Washington for duty with the War Plans Division of the Air Staff. At that time President Roosevelt '42 instructed General H. H. Arnold '42 to draw up a strategic blueprint for the air forces in case of war. In ten weeks of sixteen-hour days, seven days a week, four future generals—George, his assistant Hansell, Kuter, and Walker—worked out a plan for the strategic long-range bombardment of Germany which was subsequently put into action and, "with necessary combat modifications, has stood up in Europe." It provided for an unprecedented force of more than 2,200,000 men and 88,000 planes; presumed that war would develop against Germany and Japan at the same time; and arranged for the European enemy to be dealt with first, by "a sustained and irresistible bombing offensive, deliberately aimed at Germany's vitals, [that] would make an invasion either unnecessary or . . . tremendously easier." All this was months before the Pearl Harbor attack hurled the United States into the Second World War.

U. S. Air Forces
BRIG. GEN. HAYWOOD S. HANSELL

The quality of Hansell's work brought him two promotions within three months—to lieutenant colonel (temporary) in January 1942, and to colonel (temporary) the following March. It also won him the Legion of Merit and, in August 1942, his promotion to brigadier general (temporary) and an assignment as General Ike Eisenhower's '42 air plans officer in the European Theater of Operations. In permanent rank, however, the new General was still a captain—a junior officer.

Feeling the need of more experience in the field, Hansell had himself transferred to the Third Bombardment Wing of the Eighth Air Force in December, as commanding general. At the beginning of 1943 he was given command of the First Bombardment Wing, composed of B-17 Flying Fortresses. On the third of January the flying General won the Silver Star for the "indomitable courage and superlative leadership" with which he led a bombing attack on the German U-boat pens at St. Nazaire against "terrific odds," bringing his planes to a friendly base without loss of life or equipment. Other missions won Hansell the Air Medal and the D.F.C.; and on March 13 he celebrated his elder son's birthday by flying his namesake Fortress, the *Tony H*, to occupied Amiens and "plastering hell" out of the freight yards there. Then in July he was recalled to London and a "chair-borne" job

HANSELL, HAYWOOD S.—*Continued*

as Air Marshal Sir Trafford Leigh-Mallory's '44 deputy commander in chief of the Allied Expeditionary Air Force in the Mediterranean.

In October 1943 Hansell was sent back to Washington for duty in the Office of the Assistant Chief of Air Staff for Plans. As an air planner on the joint planning staff of the Joint and Combined Chiefs of Staff, he was a member of the military delegation to the Roosevelt '42-Churchill '42 conference in Quebec and to the three-power conferences at Cairo and Teheran. Returning from these, Hansell accompanied General George Marshall '40, United States Chief of Staff, on his globe-girdling thirty-five-thousand-mile inspection tour in December 1943.

Four months later General Hansell was promoted to the post of deputy chief of Air Staff, and was soon chief of staff as well to General Arnold in the General's capacity as commander of the secret global air force of super bombers which was then being developed. This Twentieth Air Force, composed of B-29 Superfortresses which dwarfed every other plane that had ever been built, was to operate as "an aerial battle fleet . . . wherever the need was greatest." Directly under control of the Joint Chiefs of Staff in Washington, it is in effect a separate air force, commanded personally by General Arnold and acting through bomber commands responsible to a deputy commander, Lieutenant General Millard F. Harmon '42. The battle debut of the new force was made on June 15, 1944, when the Twentieth Bomber Command, then under Brigadier General Kenneth L. Wolfe, sent Superfortresses over Japan from West China bases—the first land-based planes to bomb the Nipponese islands, and the first raid since General James Doolittle's '42 daring strike at Tokyo in April 1942. From his headquarters in Washington's Pentagon Building, Hansell directed that first B-29 mission against the vast Yawata steel works on the island of Kyushu.

At that time initial elements of the still-secret Twenty-first Bomber Command, which had been activated in March, started for the Japanese-held Pacific islands in which they were to establish Superfortress bases. By the time they arrived the islands had been wrested from the Japanese. Hansell was placed in command on August 29, but not until September 1944 was it known that he was leaving Washington; later that month he was one of a group of American officers made Commanders of the British Empire for their distinguished service in the war. In mid-October the General landed the first B-29 to reach Saipan Island in the Marianas group. During the final training of his men, most of whom were veterans from other theaters of war, Hansell tightened up the Superfortress formations by taking up a P-47 fighter and himself "making passes" at the huge ships. That way he was able to tell the pilots just how their defensive positions could be improved. On November 24, when there was still "a sizable number of armed and desperate Japanese troops hiding in the hills" of Saipan, Superfortresses of Hansell's command made their first raid on Tokyo. Remarking on the "sheer grandeur of the remarkable assault," correspondent George Horne warned against forgetting that the men who planned the raid themselves called it "in a sense experimental and tentative." Less than seventy-two hours later, Hansell's bombers "dramatically displayed the requisite ability to sustain an aerial offensive against the mainspring of Japan's war machine" by another attack. But the General himself was not along. As he ruefully told reporters, he was grounded—by higher-ups who thought him too valuable to risk.

General Haywood Hansell is described as slight of build, smiling, "brown-thatched," and of ruddy complexion. Speaking in a soft, rich baritone, he impressed the war correspondents assigned to him with the honesty and frankness of his statements, which are phrased in colorful terms. Formerly Hansell was one of three high air officers who, in his words, "might have been called the 'radicals' of the Air Force. We believed in a separate air force," he said, "and we believed without any compromise that air power could win a war alone. Now all of us believe that the proposal for a unified war department over all arms of the service is better. Air power, land power, and sea power should work together to win wars. That is the best way." And Hansell is, according to Sidney Shalett, "only slightly less difficult to dissuade than it is to shoot down a Superfortress with a kid's popgun."

HANSEN, ALVIN H(ARVEY) Aug. 23, 1887- Economist; university professor

Address: b. Littauer Center, Harvard University, Cambridge, Mass; h. 56 Juniper Rd., Belmont, Mass.

Considered for many years the New Deal's ace economist, Professor Alvin H. Hansen, leading American exponent of the deficit spending theories of John Maynard Keynes '41 and of the "compensated economy" principle, has won an undisputed place in liberal economic circles. His postwar fiscal policies, set forth in such publications as *After the War—Full Employment* (1942) and *America's Role in the World Economy* (1945), are said to have greatly influenced proposed postwar legislation such as the full employment bill of 1945.

The son of Danish immigrant parents, Niels B. and Marie Bergita (Nielsen) Hansen, Alvin Hansen was born in Viborg, South Dakota, on August 23, 1887. He entered Yankton College, South Dakota, where he earned his board and tuition by waiting on tables; during vacations he milked cows and did other farm work. One winter he took care of a doctor's horse to earn his board and room. He participated in all the college debates, and one year won the debating competition. In 1910 he received his B.A. degree. He also holds an LL.D., from Yankton (1936).

In order to continue his college work Hansen took the post of principal, then superintendent, of the Lake Preston, South Dakota school system from 1910 to 1913. He received his M.A. from the University of Wisconsin in 1915, then became assistant instructor in economics at the university in 1915-16. Following this, for the next three years he taught economics at Brown University and in 1918 received his Ph.D. in economics from Wisconsin. He then continued his teaching at the University of Minnesota, where he was associate professor of economics (1919-23), then professor of economics for several more years. He still returns to Minnesota to give a course of annual lectures, and he was visiting professor in the summer sessions at Leland Stanford (1933) and Columbia (1937). Since 1937 he has also been the Lucius N. Littauer Professor of Political Economy at Harvard University, from which he received an honorary M.A. in 1942.

In 1933 Alvin Hansen began his career as an economic adviser in government, when he became research director and secretary to the Commission of Inquiry on National Policy in Economic Relations. In 1934 he was also appointed as a member of the Columbia University Commission on Economic Recovery. His first work in Washington was as an economist for the State Department in 1934-35. Hansen then became economic adviser to Prairie Provinces before the Canadian Royal Commission in Dominion-Provincial Relations; and he has been chairman of United States-Canada joint economic committees since 1941.

The economist began to be well known in Washington governmental circles when he testified before the Temporary National Economic Committee—testimony dealing with public investment and fiscal policy, and which was widely publicized. Hansen also was named a special economic adviser to the Federal Reserve System. Although the genial, quiet Harvard professor made no headlines, it has been said that he directed the economic policies of the Roosevelt '42 Administration. He was the friend and adviser of Marriner Eccles '41, chairman of the Federal Reserve System; and of Henry Wallace '40, Senator Robert Wagner '44, and other New Deal Congressmen. His influence increased when, during the early war years, he served as consultant to the National Resources Planning Board (abolished by Congress in 1943). In September 1941 he and Professor Luther H. Gulick '45 of Columbia University were the American delegates to the International Conference on Science and World Order held in London. Hansen also undertook, with Guy Greer, an extensive study of postwar urban redevelopment.

During these years Hansen had acquired his reputation as an economist of importance through his articles and such books as *Economic Stabilization in an Unbalanced World* (1932), *A New Plan for Unemployment Reserves* (1933) and *Full Recovery or Stagnation?* (1938). Of the last named the *Nation*'s reviewer wrote that "anyone who will cast aside his preconceptions and prejudices and study this book carefully will gain greatly in understanding of the world's problems." Several years later, when the immense war effort called forth "the biggest debt in the history of America"—an estimated one hundred and fifty billion dollars before the war's end—and Americans grew concerned over "the prospect of generations yet unborn shouldering the burden," Hansen, in what one reviewer called "one of the most discriminating and controversial fiscal books of the year," declared that the Nation would be well able to carry this financial load. His book *Fiscal Policy and Business Cycles* (1941) bore directly on the deficit problem of the Roosevelt budget. In it Hansen set forth the theory that capitalism is gradually being modified into what he called "a dual economy," with increasing Federal projects existing on a side-by-side basis with private industry. This system will work, he said, as long as there is an expanding economy. He contended that a public debt is not like a private debt, it is an instrument to control national income. It should be increased as a means of fighting depression, and reduced if inflationary tendencies arise.

Harris & Ewing

ALVIN H. HANSEN

The book was called "the maturest analysis of the theory of a mature economy published so far" (*Commonweal*), and "the best expression of the compensated economy idea that has yet been produced" (New York *Times*). More conservative economists, on the other hand, disputed Hansen's theories. Henry Simons of the University of Chicago praised his "clarity of statement and excellence of style," but attacked him for his attitude toward private investment, "his disposition to write it off as technically hopeless or unpromising, and thus to evade and minimize what is our central policy problem." Nor did he favor Hansen's theory of debt expansion: The plan, he said, is "utterly defeatist if not utterly collectivist," and would "hasten the disintegration" of free exchange and free enterprise.

Hansen's pamphlet *After the War—Full Employment* (1942) became another focal point for a vigorous economic controversy. What is required, he said, is "a positive program of postwar economic expansion and full employment, boldly conceived and vigorously pursued." Disputing the theory that a postwar depression is inevitable, he wrote: "No country need be impoverished if its productive resources (both capital and human) are intact. The productive resources of this country will be on a considerably higher plane when this war is over

HANSEN, ALVIN H.—*Continued*

than ever before." Hansen's program called for, among other things, high corporate-income and excess-profits taxes; broadening of the individual income tax base, together with steeply graduated surtax rates; part payment of wages and salaries in defense bonds; major emphasis on the individual income tax and less reliance on the corporate income tax. He also advocated a program of public projects, including nationwide development of national resources, transportation facilities, and a public housing program; and expansion of public welfare expenditures and international collaboration to pursue internal policies designed to promote active employment. His plan was immediately attacked by the press, and by conservative Congressmen as a form of "economic dictatorship." Said the New York *Times*: "We must not forget that legitimate profits are the driving force of our whole system of private enterprise. . . . To place our reliance upon a scheme of perpetual Government borrowing and spending to circulate purchasing power . . . would mean that we were merely resigning ourselves to our own brand of economic totalitarianism after beating back the Nazi brand." But it was Hansen's program that underlay the full employment bill sponsored by Senators Murray '45, Wagner '41, and O'Mahoney in 1945.

In various articles published in 1942-43, Hansen continued to discuss aspects of his postwar economic program. The basic tasks confronting the world after the war, he stated, were the "elimination, or at any rate vast reduction of unemployment, the improvement of wide areas of low economic productivity, and the increase of consumption and its direction into more efficient channels. Together, they challenge the courage and creative genius of mankind." He advocated extensive international survey of resources, and the establishment of an international reconstruction finance corporation. "There will be need in the postwar years for three new international economic institutions: one to take care of monetary stabilization, a second to expand international capital investment, and another for the control of prices of primary products."

Writing for *PM* in April 1944, Hansen discussed three outstanding economic questions: 1) Can the United States escape chaotic financial conditions with a three-hundred-billion-dollar national debt? Yes, said Hansen, citing historical parallels in countries—like England following the First World War—employing orthodox financial methods, in contrast to the unsound financing in Germany at that time. The United States has enormous productive power based on vast resources, and enormous taxable capacity. "I think it may safely be asserted that the credit of such governments as the United States, Canada, and England surpasses by far that of any institution, public or private, in all history." Nor will vast holdings of bonds, contended Hansen, create an inflation, for less than twenty billion dollars' worth of these bonds are held by the general public—"This does not present any terrifying picture of a great spending spree." It was highly probable, too, that most people would hold these bonds against future need. The United States was actually in greater danger of not finding markets for its products than it was of inflation. "But in the transition from war to peace, if we do not control prices we shall have chaotic conditions. We must continue the controls where they are necessary."

2) What may the Federal budget look like in the postwar period? First, it should be flexible, varying according to economic conditions. "It is sound finance to balance the budget only when private capital outlays are high enough to create full employment." The Federal budget must be planned ahead in order for it to act as a balance wheel to the nation economy. To avoid mass unemployment in the postwar period the Government must be ready with an adequate volume of useful and productive public investment, and with plans for public development projects.

3) What about postwar taxes? Hansen believes the main features of a postwar tax program should include: complete elimination of the excess profits tax; major reliance on individual income tax: raising exemptions and lowering the rates on personal incomes; sharp reduction in corporate income taxes; elimination of the nuisance war taxes and selective sales taxes, except the excises on alcoholic beverages, tobacco, and customs duties; generous loss offsets carried back and forward in order to induce risk taking and new investment. Above all, a compensatory fiscal program is necessary to cope with depression—a program which all democratic countries must undertake. In a compensatory program, if business conditions are good, government spending can be low, tax rates medium, borrowing at a minimum; but if business conditions are bad, government spending must be high, tax rates low and borrowing encouraged in order to maintain adequate family income.

In *America's Role in the World Economy* (1945) Alvin Hansen discussed the international machinery in the economic and financial fields indispensable and complementary to a world political organization. He emphasized throughout the book that it is impossible to promote international political security without, at the same time, promoting international economic security. He repeatedly stressed that the United States can make no greater contribution toward the solution of international problems than that of achieving a high level of internal stability, business activity, and employment. "Then we need no longer have any fear of imports. . . .It will be clear to everyone that goods imported are a net gain to our real income and to our consumption standards." Instead of trying to keep "backward" nations from competing, the United States should lend them money to develop their own railways, roads, and electric power in order to help raise their incomes and purchasing power. This will stimulate a demand for the typewriters, automobiles, and household appliances which America is in a favorable condition to supply. Although living standards in those countries rise, they will never reach such a point of self-sufficiency that they will stop buying. Hansen favored the Bretton Woods proposals for an international bank for reconstruction and development, and an international monetary fund. He said that these two institutions constitute "the cornerstone of the structure of international economic cooperation." He refuted opinion that opposes the Bretton Woods proposals, stating that, if the United States fails to enter these pacts, it will also remain aloof from other international economic institutions.

Critical opinion stood solidly behind Hansen's proposals in *America's Role in the World Economy.* "No one concerned to understand the basic economic issues underlying America's stake in the postwar world can afford to neglect it," said the critic of the New York *Times Book Review.* Herbert Morris pointed out in *PM* that Hansen has "displayed an immense capacity to change his thinking to correspond to the changes in our ways of work and wealth," that twenty years ago he was "an ardent apostle of Coolidge capitalism," but that today, in company with Keynes and Beveridge '43, he is a spokesman for a totally different view. His experience in the State Department and the Federal Reserve System has shown him that "the Good Neighbor Policy will be only a masquerade unless America puts its muscle into a positive program of world-wide economic collaboration." Hansen's book was praised not only for its timely theories, but for the clarity and simplicity of its writing. "Please don't ever complain again," commented a reviewer in the Chicago *Sun Book Week,* "that nobody bothered to tell you what the score is on the economic requisites for peace. Hansen did, and now the next move's up to you."

Hansen is a member of the American Economic Association (vice-president in 1937, president in 1938). He was associate editor of *Econometrica* from 1933 to 1938, and he has been a member of the board of editors of *Quarterly Journal of Economics* since 1937, and of the *Review of Economic Statistics* since 1938. In July 1945 he resigned from his position as special economic adviser to the Board of Governors of the Federal Reserve System, but he continues to serve as occasional consultant. Since September 1945 he has been acting as consultant to the Province of British Columbia on matters relating to the impending Dominion-Provincial fiscal agreements.

In August 1916 Hansen was married to Mabel Lewis; they have two daughters, Marian Grace and Mildred Jean. The professor-economist, who is said to have "upset more classical economic concepts than any other man in our era," and who has exerted much influence in Government circles, is described as "for the people because he is of the people." He is mild-mannered, square, and stocky, "with a little more than a suspicion of a middle-age droop. Yet he is fast on his feet," wrote one reporter. "His eyes are blue and somewhat sensitive to light, and the green eyeshade he habitually uses is known wherever economists gather. He is five feet six inches tall and weighs about one hundred and seventy pounds. A clearing runs down the middle of his head, flanked by somewhat disorderly light-colored and mildly fluffy individual hairs." Hansen has been too busy during the war years to take many vacations. But he likes to return occasionally to pitch hay and milk the cows on the South Dakota farm which was homesteaded by his parents, and which he now owns.

Who's Who in America, 1944-45

HARBORD, JAMES G(UTHRIE) Mar. 21, 1866- Corporation executive; retired United States Army officer

Address: b. Radio Corporation of America, 30 Rockefeller Plaza, New York City; h. Dogwood Lane, Rye, N.Y.

Recipient of many honorary university degrees and American and European military decorations, author of three books and a prodigious number of articles, executive in a dozen business enterprises, chairman of the Radio Corporation of America, James G. Harbord has spent most of his fourscore years in public service. A farm boy, he rose from the ranks of the United States Army to be a general in the First World War, and then advanced in civilian life to the head of one of the largest corporations in the United States.

JAMES G. HARBORD

James Guthrie Harbord was born March 21, 1866, in Bloomington, Illinois, the son of George W. and Effie Critton (Gault) Harbord. Young James's early days were spent on the prairies of Illinois; when he was six his father, a veteran of the Civil War, moved the family to Missouri and then to a farm in Kansas. Early in his teens the boy had set his heart on a military career. Accordingly, he studied at the Kansas State Agricultural College where military training was included in the curriculum. He earned part of his way by typewriting catalogue cards in the library, and was graduated in 1886 with a B.S. as senior captain of the cadet corps, the top student officer. With the idea of entering West Point, young Harbord took the competitive examination with twenty-six other aspirants, tying for first place with another candidate. Because of a circumstance, the other man received the

HARBORD, JAMES G.—*Continued*

appointment. Low in spirits but determined to enter the Academy, Harbord decided to wait for another opening, in the interim remaining to teach at the State College.

In 1889, aware that his age would soon bar him from the Military Academy even if a vacancy should occur, at the age of twenty-two the young teacher enlisted as a private in the Army, intent upon earning a commission. He was assigned to the Fourth Infantry and was sent to Fort Spokane, Washington, for his basic training. Young Harbord earned steady promotion; his rapid advancement, according to several stories, was the result of the kind notice a sergeant had taken of his college training, his proficiency at the typewriter, and his flair for writing.

After two and a half years in the ranks, Harbord, then a quartermaster sergeant, was permitted to take the officers' examination upon the recommendation of his colonel. In that competition he won first place. Commissioned a second lieutenant, he performed his "shavetail" chores while on duty with the Fifth Cavalry in Kansas, Texas, and the Indian Territory. In 1895 he was graduated from the Infantry and Cavalry schools with honors. (That same year he received a M.S. from Kansas State Agricultural College.) Three years later, when the Spanish-American War broke out, the young second lieutenant was commissioned a major (temporary) in the Second United States Volunteer Cavalry, commonly referred to as the Torrey Rough Riders. At the close of the war he was reverted to the permanent rank of first lieutenant in the Regular Army and was posted with the Tenth Cavalry.

With the acquisition of Guam, Puerto Rico, and the Philippines by the United States at the end of the war, American officers were transferred for duty in these possessions. Lieutenant Harbord's first position was in the Adjutant General's Department at Santiago, Cuba (then under military occupancy by the United States); this was followed by similar duty in Puerto Príncipe (now Camagüey), Cuba, and in Eastern Cuba. Promoted to captain in 1901 with the Eleventh Cavalry, he became assistant chief of the Division of Insular Affairs in the Office of the Secretary of War. In 1902 Captain Harbord was transferred to the Philippines, where he served as a cavalry officer until the following year. Then, upon the recommendation of Major General Leonard Wood (former Military Governor of Cuba), William Howard Taft (then Governor General of the Islands) appointed Harbord colonel and assistant chief of the Philippine Constabulary. Harbord was then detailed to the especially trying post of chief of the Moro Constabulary in the Philippines. His task was to subdue the Moros, who for centuries had been harassing the other natives with their sporadic raids. After serving in southern and central Luzon, Harbord was appointed chief of the Philippine Constabulary in 1904. In 1914, after a decade of service on the Islands, he returned to the United States in compliance with the American pledge to delegate greater powers of self-government to the Filipinos. While stationed with the First Cavalry in California and Arizona, Harbord was given the rank of major; he saw service with Pershing on the Mexican border in 1916; then attended the War College in Washington from September to May 1917.

Prior to America's entrance into the First World War, ex-President Theodore Roosevelt, foreseeing the eventual involvement of the United States in the conflict, conceived the idea of organizing one hundred thousand volunteers for immediate action when war should be declared. For this task Roosevelt selected Harbord as a brigade commander. The plan was rejected, however, by the Secretary of War on the counsel of military leaders. But Harbord was to be called to a somewhat similar assignment not long after that: his course at the War College was interrupted in May 1917 when, soon after the United States declared war on Germany, General Pershing asked Harbord to accompany him to France as chief of staff of the AEF to assist in organizing, equipping, and training the American Expeditionary Forces for service. (That month he was made lieutenant colonel.) In record time an army of two million men was ready for trench warfare, and Colonel Harbord continued to serve under General Pershing until May 1918. He had been advanced to brigadier general of the National Army the preceding August—the National Army being that group of units composed of men obtained by the Selective Service Act, after Regular and National Guard quotas had been designated.

But Harbord was not content to remain in an administrative post, and in the critical spring of 1918, when the Allies were suffering severe setbacks, he asked to be transferred to the front. That March, April, and May the Germans had launched three great offensives which had succeeded in opening a wide breach in the British and French lines, bringing them by May 30 to the Marne River, within thirty-seven miles of Paris. At this point the Second Division of the AEF under General Omar Bundy was rushed up to assist the French Sixth Army. The American division was deployed across the Paris-Château-Thierry road facing Ludendorff's forces, who were concentrating northwest of Château-Thierry at Vaux and in the Belleau Wood, a forest tract less than a mile square. General Harbord was placed in command of the Fourth Marine Corps Brigade and given the task of dislodging the enemy from these positions. On the first attack the brigade penetrated the German lines but did not succeed in holding the wood. In the bitter two weeks of fighting that followed, however —the first time that trench warfare was supplanted by fighting in the open—the marines took Belleau, Bouresches, and Vaux, stopping the German advance toward the French capital. The Germans had lost 24 guns and 1,654 prisoners, but the Americans had suffered the loss of 285 officers and 7,585 men killed, wounded, and missing. In 1923 the Belleau Wood was dedicated as a permanent memorial to the United States officers and men who had lost their lives there, and the French Government changed its name to Bois de la Brigade de Marine. The engagement was the first in which the Americans had played a substantial role.

The marines' commander had been advanced to the rank of major general of the National

Army after the Belleau battle and given command of the Second Division, replacing Bundy. Four days after Harbord took command, Marshal Foch ordered a counterattack to meet Ludendorff's new attack west and east of Rheims, which had brought the German forces across the Marne. Under General Charles Mangin of the French Tenth Army, Harbord led his division in the battles of July 18 and 19, a part of the great Soissons offensive (or Second Battle of the Marne) which turned the tide against the enemy and gave Foch an initiative he never relinquished.

Then, while the Second was still pushing the Germans back, Harbord was recalled from the front by Pershing to take command of the Service of Supply. This meant the coordinated supervision of base ports, of the debarkation of men and cargoes, the overseeing of warehouses, hospitals, camps, and of various construction work—all representing a responsibility second only to that of Commander in Chief. In his book *The American Army in France,* Harbord says: "It was indeed farewell to arms for me. . . . But I felt I should go anywhere that General Pershing desired and attempt anything he thought me equal to perform." After relinquishing command of his "army" at the front, Harbord, it is unanimously agreed, "made the Service of Supply a fighting 'army' in the rear." In his World War memoirs Pershing comments, "Throughout the war Harbord never hesitated a moment to express his opinion with the utmost frankness, no matter how radically it might differ from my own, nor did he ever fail to carry out instructions faithfully, even when they were not in accord with his own views." In the words of Colonel Frederick Palmer, an official observer with the American Army in France: "I saw Harbord in command of troops and understood then that he went into the Army (instead of entering some other profession) because he was first of all by nature a soldier." Harbord was reappointed chief of staff of the AEF in May 1919 and served in this capacity until August. The preceding November he had been made a brigadier general in the United States Army. In September 1919 he was made a major general. In the Second World War Harbord was to give "invaluable advice" to the Services of Supply, for which he received the thanks of Lieutenant General John C. Lee '44.

Harbord has written three books based on his war experiences. The first of these, *Leaves From a War Diary* (1925), is a collection of intimate memoranda and letters to Mrs. Harbord, originally not intended for public consumption. "It is full of pen pictures of the men and women who had a part in those stirring events," commented one reviewer, "and its informality is perhaps its greatest charm." Harbord "is a born letter writer," said the New York *Times*; but "perhaps the book would have been better with a judicious editing." His other two books are *America in the World War* (1933) and *The American Army in France, 1917-1919* (1936). The *Saturday Review of Literature* found that the latter contained "a seasoning of humor, dashes of tartness, deft and dry characterizations of sundry notables, touches of drama, sudden sorties of eloquence that are heightened by their very restraint."

In August 1919 Harbord set out for the Near East to study the Armenian situation. Since 1855 the Armenians had been the victims of massacres by the Turks which seemed to take on the shape of a systematic plan for the Armenians' extermination during the World War period. American pressure for some solution resulted in the sending of Harbord as chief of the American Military Mission to study the problem and to report the findings to the United States Government in the possibility that the United States might assume mandatory power over the area. That plan was abandoned, however, when a part of Armenia was incorporated into the U.S.S.R. in 1920, becoming the Transcaucasian Socialist Federated Soviet Republic.

Upon his return to the United States, General Harbord was assigned to command the Second Division of the United States Army at Camp Travis, Texas, until 1921, when he was appointed Deputy Chief of Staff of the Army. He held this post until December 1922, when his application for retirement became effective. (In July 1942 he was made a lieutenant general on the retired list.)

Taking stock of life in the Army, Harbord regards the profession of a soldier as a career with service, and service, in his opinion, is the yardstick of a career. He believes that "the heart of any true soldier must tell him that his is one of the noblest of professions." He has found the Army a "democratic place," but urges that more opportunities must be provided for advancement for those lacking West Point training. General Harbord maintains that the United States Army has always stood for peace, that the best means of preventing war is through preparedness, for "wars will occur while human nature remains the same and economic rivalries persist." He approved the Act of 1920, which provided the United States with its first fixed military policy, as a beginning of a gradual evolution of a citizen soldiery during peace. This act stipulated that the National Guard, Organized Reserve, and Regular Army should not be extemporized in an emergency, but that their organization should be set up and developed in time of peace. In 1939, in an address at the University of Virginia, Harbord urged that "a carefully planned selective service act . . . should be voted by Congress into permanent statute without delay. It should empower the President to augment our comparatively small Army and Navy by an application of the act immediately upon a declaration of war by Congress."

Harbord also advocated that Congress continue to reject the attempts of pacifists to make a referendum necessary before a state of war could exist between the United States and another nation. A few months before Pearl Harbor, Harbord pressed for the intervention of the United States in the war, stating that "the use of convoys to assure security of this country . . . must be done if equality of opportunity is to survive." He stressed also that "in our awareness of the totalitarian menace to our institutions lies the hope or despair of our country."

(Continued next page)

HARBORD, JAMES G.—*Continued*

When on January 1, 1923, James G. Harbord succeeded Edward J. Nally as the president of the Radio Corporation of America (three days after his official retirement from the Army), the Secretary of War made the statement: "The industry into which you are going is still in its infancy, and offers a large field for your activity. Being a gallant leader in the Army, there is no doubt that you will prove to be an equally great leader in the industrial and commercial field."

It was not until the close of the First World War that the United States Government realized that strides in the new field could only be made through directed research and a pooling of patents. In 1919, upon the Government's request for the formation of a company to prevent the acquisition of American patents by foreign interests, RCA was organized to take over all the patents controlled by General Electric, United Fruit, American Telephone and Telegraph, Westinghouse, and General Motors, these companies being compensated with shares in RCA commensurate with the value of their relinquished patents. Thus RCA was primarily set up as a "communication's corporation and patent-holder with the patent contributors manufacturing the communications equipment and RCA using it or acting as a seller."

RCA acquired about eight hundred wireless patents, including a dozen or more basic patents vital to the construction of all sending and receiving devices. According to Mauritz A. Hallgren, writing in the *Nation* in 1927, "these patents were made available to the members of the trust under what has become known as the cross-licensing system. . . . Further maneuvers gave the trust a virtual monopoly on the radio-engineering talent of the country so that today the individual members operate mammoth research laboratories, spend millions of dollars annually, employ hundreds of engineers, the fruits of whose labors, by means of another pooling arrangement, become the property of the trust as a whole."

Despite the fact that RCA was formed at the Government's suggestion, as early as 1923 the Federal Trade Commission began investigating the corporation as an alleged monopoly. RCA has asserted that "it was created primarily with a motive of carrying on, and it has since carried on, a patriotic service of making a world-wide communication system of radio, in which the most important influence rests in the United States and with the American citizens. . . . RCA was created in order to carry out the expressed desires and wishes of the United States, communicated by its officers and servants."

In 1930, the year Harbord assumed his new position of chairman of the board of RCA, the Department of Justice, pressed by the Senate and certain independent radio manufacturers, filed suit under the Sherman Antitrust Act. It was alleged "that the defendants, most of whom are competitors, by issuing patent licenses to one another have created a patent combination or pool through which they exercise joint control over the radio industry. . . . No outsider can obtain a license except on terms jointly prescribed by the chief defendants." Harbord maintained that during his incumbency radio apparatus sales had risen from eleven million dollars in 1922 to eighty-seven million in 1928. He argued that patents acquired by RCA were developed at great cost to the corporation, and that the granting of a license to radio manufacturers had been "based on their apparent ability to serve well the public." He defended license fees on the ground that they were payments to those whose energy and capital had made possible the development and purchase of inventions. Said Harbord, "Let this patent unification be at an end tomorrow, let each organization use only the radio patents it actually owns, let licensees operate only under their own inventions and not use those licensed to them by others, and on that day will topple the whole structure of service which radio is rendering for the benefit and entertainment of the American public."

In 1932 the Government's suit was finally settled by consent decree (a decree entered by consent of the parties concerned, upon agreement expressed in open court). Under it General Electric and Westinghouse had to give up their RCA holdings; interlocking directorates of the corporation were abolished; and the exclusive character of the RCA license was terminated. In 1942 the Department of Justice stated that "undisputed evidence has created an atmosphere and a public attitude which makes the decree an unworthy vehicle for the further enforcement of the law." Its appeal for termination was denied by the court, however, and the consent decree still stands.

Radio has grown by leaps and bounds since James G. Harbord entered RCA in 1923. His vision and pioneering spirit, in the opinion of many, were instrumental in developing radio from a medium intended for the exchange and delivery of messages, to its present manifold services. Harbord claims that not only is radio a servant of man in time of war (he has described the Second World War as "a radio war")—it has justified itself and, applied rightly, will assert itself even more strongly in the postwar period as a greater servant in peace. Harbord holds, too, that radio broadcasting will continue to knit the peoples of the world more closely together. Of the opinion that radio is both a science and an industry, he has said that the development of radar and television during the Second World War has predestined for the radio industry a period of greater achievement. In the words of the radio executive: "So long as invention, independent enterprise, and individual initiative are encouraged, it can never be said truthfully of the workers in radio: 'They've gone as far as they can go.'"

In addition to his RCA connections, Harbord has been a director or a member of the executive committees of several companies, including the National Broadcasting Company, Marconi Telegraph Cable Company, Bankers Trust Company, New York Life Insurance Company, Employers Liability Assurance Corporation, Ltd., Atchison, Topeka and Santa Fe Railway, and the Committee of Directors of Western Railroads. He is also a former chairman of the New York Chapter of the American Red Cross. The executive has received honorary degrees of LL.D. from Trinity College, Colgate College, Marietta College, Yale College, and Washington and Jefferson College. He has received the French Croix de Guerre, with two Palms, the D.S.M. from both the United States Army and Navy; he is a Knight Commander of St. Michael and St. George, a Commander of the French Legion of Honor; and he has been decorated with high honors by Belgium, Italy, Montenegro, Panama, and Poland. In 1937 he received the Ordnance Medal of Merit from the Army Ordnance Association. He is a member of several clubs and is a Mason, thirty-second degree.

A voracious reader, and prolific writer of magazine articles, Harbord is said to possess a keen memory and an ability to express himself succinctly. He was married to Emma Yeatman Ovenshine in January 1899, and in December 1938, a year and a half after her death, he was married to Mrs. Anne Lee Brown.

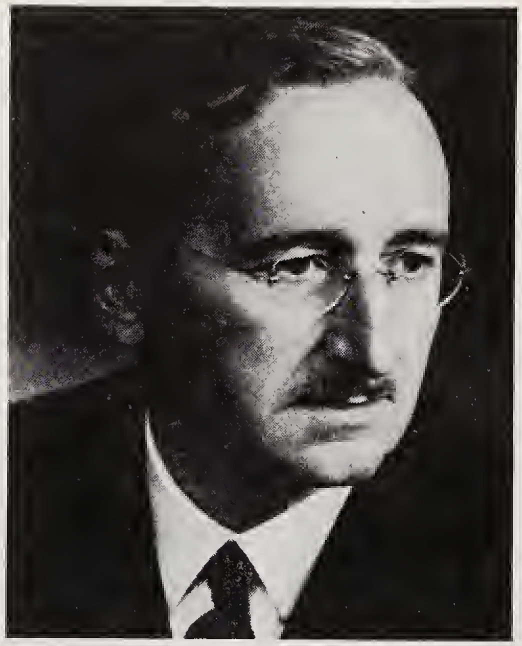
HAYEK, FRIEDRICH A(UGUST VON) (hī'yĕk frē'drĭᴋ) May 8, 1899- Economist; author

Address: b. c/o London School of Economics, Houghton St., Aldwych, London; h. 8 Turner Close, London



FRIEDRICH A. HAYEK

Friedrich A. Hayek, Austrian-born English economist, educator, and lecturer, is the author of the controversial book *The Road to Serfdom.* The economist is considered qualified to write on what he considers the dangers in central planning, not only because he has probed the subject at length but because, as he points out in the preface to his book, he has had the unique opportunity of experiencing conditions and a development of ideas in present-day England which are disturbingly similar to conditions he knew and views he himself held in his early manhood in Vienna.

Friedrich August von Hayek was born in Vienna on May 8, 1899. He is the son of the late August von Hayek, who was professor of botany at the University of Vienna. It was at this university that he received his own education, and he also holds the degrees of D.J. and D. Pol Sc. from that university, and the degree of D.Sc. (Econ.) from the University of London.

In 1921 Hayek entered the Austrian Civil Service. Two years later he went on leave to the United States, where he worked first for some months as research assistant to Professor Jeremiah W. Jenks at New York University and then, for the 1923-24 session, as a research fellow of the university. Hayek returned in 1924 to his post in the Civil Service, retaining this until 1926, the year in which he was married to Helen von Fritsch. (They have one son and one daughter.) The year after his marriage Hayek became director of the Austrian Institute of Economic Research, and in 1929 he accepted the post of lecturer in economics at the University of Vienna. This position he occupied simultaneously with the direc-

HAYEK, FRIEDRICH A.—*Continued*

torship until his eventual departure for England in 1931 to become Tooke Professor of Economic Science and Statistics at the University of London, a position in which he has since served as a member of the faculty of the London School of Economics. He is a member of the Council of the Royal Economic Society and since 1944 a Fellow of the British Academy. He became a British subject in 1938.

Professor Hayek's name first appeared on the title page of a book in 1927, when he edited the works of Herman Heinrich Gossen, the German economist, whose name has been given to the three economic theses he formulated. In 1929, while still in Vienna, Hayek published his own initial work in the field of theoretical economics, *Monetary Theory and The Trade Cycle* (the title is taken from the English edition, translated by N. Kaldor and H. M. Croome, which appeared in 1933). In this work he argues that the business cycle is caused not by variations in the value of money, but rather by fluctuations in the volume of money. In this same year Hayek also edited the works of Friedrich von Wieser, one of the leading exponents of the Austrian school of economics, in the atmosphere of whose doctrines Hayek had received his own early training.

In the two-year interval which preceded Hayek's next contribution to theoretical economic thought, *Prices and Production* (1931), he had gone to the University of London; his book, therefore, was appropriately published in English. The volume, a series of four papers read before the University of London in 1930-31, deals with, among other economic theories, the ease for and against an "elastic" currency. Hayek next edited *Beiträge sur Geldtheorie* (1933), and in the same year, 1933, began editing the works of the founder of the Austrian, or "subjective," school of economics, Carl Menger, who considered primary in the study of economic phenomena "the values which men place on goods because of their utility." This task was not completed until 1936.

In the meantime, Hayek was also editing *Collectivist Economic Planning* (1935), his first appearance in print with the theme of *The Road to Serfdom.* The volume is a compilation of articles on the problem of central planning versus competition, written by leading twentieth century economists. These articles were selected by Hayek, who wrote for the book an introductory historical note and a concluding chapter setting forth the "Present State of the Debate."

During the year 1937 he had journeyed to Switzerland to lecture before the Graduate Institute of International Studies at Geneva, and upon his return to England in 1937 his lectures were published under the title of *Monetary Nationalism and International Stability.* Extending to the international field his belief in the cruciality of the volume of money, as propounded in *Prices and Production*, Hayek suggests as a cure for the great variability of liquidity of national currencies the amendment of present laws to permit 100 per cent coverage of bank deposits by paper money so that purchasing power shall hereafter move, in the words of Honor Croome, "not merely in proportion to gold but actually to the same extent."

Although theoretical or academic economics is Hayek's main interest, in April 1938 he again paused to sound a warning against the danger of dictatorship he saw in central planning. His article, "Freedom and the Economic System," which appeared in the *Contemporary Review* that month, was reprinted in enlarged form as a *Public Policy Pamphlet* by the Chicago University Press in 1939, and this became the core of *The Road to Serfdom.* Afterward, he returned to his university studies, producing in 1939 *Profits, Interest, and Investments,* an edition of the works of H. Thornton, and, in 1941, *The Pure Theory of Capital,* written to supplement the brief treatment of this subject in his earlier *Prices and Production.* At the same time the economist was contributing frequently to several English economic and general periodicals. In these he advocated, among other policies, a commodity reserve currency (in 1943), and (in 1939) a plan that Britain join France in an economic federation which would form the skeleton for a federation of all Europe. He also defended his theories against attacks.

In the early 1940's Hayek was mainly engaged in a comprehensive study of the interaction of social and scientific trends during the nineteenth and twentieth centuries, only parts of which have thus far appeared in the journal *Economica*; in connection with this he was also working on an edition of the letters of John Stuart Mill. But the dangers of totalitarianism seemed to him in the last years of the war with Germany to be increasing so alarmingly that he interrupted this work for an attempt at more popular exposition.

It was, in the economist's opinion, those concerned with the welfare of the laboring classes who in Great Britain were advocating the very policies which their counterparts had earlier advocated in Germany and which, according to Hayek, had made Hitler's '42 rise possible. Fascism, he believes, is not a reaction to collectivist and communist policies but grows out of them, because the administrator of a central plan, in order to be successful, must impose his aims and values upon the people and must exclude all ideas or policies which might jeopardize the proper functioning of the plan. "There can be no freedom of thought, no freedom of the press, where it is necessary that everything should be governed by a single system of thought. In theory," he says, "socialism may wish to enhance freedom, but in practice . . . totalitarianism is nothing but consistent collectivism, the ruthless execution of the principle that 'the whole comes before the individual' and the direction of all members of society by a single will supposed to represent 'the whole.'" Hayek believes that not only is central planning a potentially dangerous weapon but that it is also an inefficient and unwieldy tool as compared with free competition: he maintains it is impossible for one bureau or government leader to know at one time all the factors which will affect production and consumption, whereas, "this is precisely what the price system brings about if competition is functioning."

Although Hayek strongly favors world-wide free trade, he does not oppose all governmental regulation of business. He supports governmental control of industry to prevent monopoly and to provide a framework within which competition can operate—"the rule of law," as he calls it. He also endorses some forms of government investment and social security measures, but he insists that the individual must be left free to determine his own destiny in accordance with the laws of his country, unrestricted by the whims of one man or a minority in power. Competition, he writes, "is the only method which does not require the coercive or arbitrary intervention of authority."

The Road to Serfdom was published in England in early 1944, and in America in September of the same year. In the United States it made the nonfiction best-seller list almost at once, and on both sides of the Atlantic it evoked vociferous laudatory and condemnatory criticism in equal measure. Wrote H. J. M. of the Kansas City *Star,* "New Dealers will attack it and Right-wingers will praise it—but nobody can deny that it is an important book." From one side came a *New Republic* comment in a note entitled "Poor Mr. Hayek": Unrealistic, unhistorical, and pathetically ineffectual to restore "the economic theories of the eighteen-eighties." From the opposite side Henry Hazlitt of the New York *Times* declared, "One of the most important books of our generation," while the *Saturday Review of Literature* critic wrote, "Its thesis will come as a shock to many readers. It would be good if they would not refuse to read the book because it seems to run counter to many of the widely accepted and cherished slogans of the day, but accept the challenge and enter into the discussion." A shock of this kind was felt by Paul Hutchinson whose review in the *Christian Century* seems to carry out the injunction of the *Saturday Review*'s article. Hutchinson credits Hayek with having jolted him out of the complacency in which he saw himself as "left of center" while having only a vague notion of what a new socialist order would be. Hayek has not convinced him on all points, he says, but Hayek's argument seems to him "to demand serious and respectful consideration." (Hayek's ideas later became the subject of rebuttal in two books—Herman Finer's *The Road to Reaction* and Barbara Wootton's *Freedom Under Planning.*)

As a consequence of such reviews, in early 1945 the National Concert and Artists Corporation arranged a lecture tour of the United States for the author, during which he repeated and amplified his statements. He also appeared on the air on the *University of Chicago Round Table* in April, and his book was dramatized on the radio program *Words at War. Reader's Digest* printed a condensed version of the book in its April issue, and this condensation was reprinted in pamphlet form by the Book-of-the-Month Club, as well as in a series of ten daily articles distributed through Hearst's King Features Syndicate.

This success of course pleased Hayek. But it also embarrassed him somewhat, he declared in the Chicago *Sun,* to find that his arguments had become party weapons in the United States, because he had written *The Road to Serfdom* with very little thought of America. He explained that he had seen Britain selling her birthright, her talent for adaptation and compromise, "the British capacity for muddling through," and he had set out to put his adopted country on her guard. "If in the growth of the social and political structure of Britain," he wrote in the *Spectator* of January 26, 1945, "the unforeseen and unintended has so frequently emerged, that is of course merely another way of saying that it has never been planned as a whole. In the piecemeal process of adaptation and change there has always been opportunity for the people to change institutions into something different from what they were intended to be, to create a society which was not the result of a single coherent plan but of innumerable decisions of free men and women."

Professor Hayek, who has brown eyes, is a man of commanding stature; he is over six feet in height and weighs nearly two hundred pounds. Book-collecting and mountaineering are his favorite forms of relaxation. One far-reaching effect of the economist's opinions was heard in his adopted land in June 1945 when Clement Attlee['40] remarked that Winston Churchill's['42] Parliamentary campaign speeches that year seemed to be merely "a second-hand version of the academic views of . . . Professor Friedrich August von Hayek."

HAYTER, STANLEY WILLIAM Dec. 27, 1901- Artist

Address: b. Atelier 17, 41 E. 8th St., New York City; h. 247 Waverly Pl., New York City

Under the auspices of New York's New School for Social Research, an English painter continues in America his experiments in the graphic arts in his communal workshop. The studio, Atelier 17, which had its inception in Paris, is the outgrowth of his researches in an almost forgotten art. Between the Italian line engraver, Andrea Mantegna, and Stanley William Hayter lie five centuries during which engraving had been almost completely neglected except for a brief reappearance in the nineteenth century in the work of William Blake. Until Hayter became attracted by the possibilities of the powerful incisive line which can be cut directly into the metal, engraving had been relegated primarily to use in reproductions, and then photography pushed it out of that field, too. To Hayter's studio come mature artists as well as students who are interested in exploring with him all the possibilities of the rediscovered art.

The second son of William Harry and Ellen Mercy (Palmer) Hayter, Stanley William Hayter was born in London, December 27, 1901. (Later two daughters were born to the Hayters.) Although the painter's brush was a familiar object in this home—his father was an artist of no mean talent—the youth was persuaded to turn his back upon the art world. As if to escape the captiousness of the art critics and the coolness of the general public toward evolving art forms, he chose the career of a research chemist. After graduating from Whitgift, a secondary school founded by the

Rose Adler, Paris

WILLIAM STANLEY HAYTER

Archbishop of Canterbury at Croyden during the reign of Queen Elizabeth, young Hayter was enrolled at Kings College, London University. Apparently he was impatient to begin his career as a scientist, for at nineteen he was in possession of his degree. He was only twenty-one when he signed a contract as oil chemist in 1922, and for the next three years Hayter spent his working time in the oil fields of the Anglo-Iranian Oil Company in Albadan, Persia. His free hours he devoted to painting the Persian scene and to experiments in cubism. The first setback to the artist came not from the critics but from an attack of malaria which sent him home to London in 1925. There his company generously featured his paintings at a one-man show it arranged for him at its own expense. In doing this it unwittingly lost a chemist. The exhibition was successful beyond Hayter's expectations, and the newcomer to the art world headed for Paris, the mecca of the artists in the twenties.

The year was 1926. Montparnasse was seething with the bouts of the academicians and the cubists, and Hayter plunged into the fray. During the week he studied under Laurens the technique of certain Salon painters, which he disliked. After five days of this tethered conformity he would "lash out half a dozen savage cubisms" for the Saturday composition class. Invariably he was rewarded with a rise in Laurens' blood pressure. Despite his distaste for the type of training he was receiving, Hayter spent six months at this study of painting. Had the artist been content to remain just another participant in a Montparnassan battle in which paint and print flowed freely, his story might have ended there. The scientist's curiosity, coupled with the artist's need for the discovery of newer forms of expression, urged him on to explore the resources of the graphic arts. Since 1921, in fact, he had been experimenting, although not consistently, with etching. By 1927, when he had become quite proficient at it, he returned to it with intense interest. Then one of the rare practitioners of the medium of Mantegna and Blake introduced him to it and Hayter quickly saw the creative possibilities it offered.

The significance of line engraving to Hayter lies in its being a perfect medium for the "integration of space and object," one of the problems which is the concern of the modern artist. In the March 1941 issue of the quarterly *Print* he defines engraving as "the production, by direct cutting, of grooves or irregularities in a surface. The surface may be of wood, stone or metal; and the incisions made in it can be designed to decorate or enrich the surface of the original, or to produce a surface from which one can print by either of two methods. In one of these methods, called 'intaglio,' ink is held in the crevices of the plate, the surface being wiped clean and the threads of ink transferred to damp paper by suitable pressure. It is obvious that such a line will stand up in relief above the level of the sheet, the paper being molded, or squeezed, by the pressure of the press, into the hollow of the plate. The alternative method of making a print from an engraved plate is to ink only the level surface with a composition roller, so that the cut-away parts of the plate remain clean. The print will be the negative of the intaglio print previously described, and the ink will lie on the *surface* of the paper. . . .The tools required are few and simple: a copper plate, a burin which must be extremely sharp, and a triangular section scraper, a burnisher, charcoal block and Scotch hone for corrections."

According to Hayter there is no routine method of handling line engraving, inasmuch as there are about twenty different ways of using the line engraving medium, and continuous experiments constantly disclose new procedures. It is all a matter of convenience to the individual artist. Line engraving as it is practiced by the artist is definitely not copy work but, as in painting and sculpture, he may find it necessary to draw about a dozen versions of his subject before he applies his burin, the cutting tool, to the copper plate. From then on he works directly from his original, preconceived idea. "You walk into your drawing like a map, instead of around it as you do in a pencil drawing," he said once in explanation of his technique. "Some prehistoric craftsmen saw drawings that way, too." Printing is done by the artist himself to insure a close relationship between the design on the copper plate and the one transferred from it to paper. In conjunction with line engraving, etching is often employed "to provide a concentrated mechanical element in contrast to the very flexible, expressive line of the burin, so that tension is not spread all over the plate." With the aid of a piece of silk, a skin, or an old gauzy stocking Hayter also varies the texture of his completed designs.

Hayter opened his Atelier 17, which takes its name from his Parisian address, 17 Campagne Premier, in 1927. Two American women had come to buy prints from him at his studio and became so enamored of his work that they persuaded him to instruct them in his methods. A few more pupils joined, and Atelier 17 was on its way. Later Pablo Picasso '43, Max Ernst '42, Marc Chagall '43, Jacques Lipschitz, Joán Miró '40, and Alexander Calder joined the artist in his studio. They came to learn the graphic process and to work with him in what became, in the truest sense, a communal workshop. In a sympathetic article on Hayter's work, the art critic Rosamund Frost (*Art News*, May 15-31, 1941) emphasizes that at the Parisian atelier "there were no trade secrets and any technical discovery was common property for the benefit of the group. Hayter made all tools, supervised all processes. . . .He first tried printing on plaster with astounding effects. . . .All in all, he assisted at the making of at least five thousand plates, or something like five times an average lifework, so it's not surprising that his technique is what it is."

For twelve years, from 1927 to 1939, Atelier 17 flourished in Paris. During that period Hayter had imparted his methods to some three hundred students. In addition to being shown annually at the galleries in Paris between 1934 and 1939, the prints were sent on group tours to Czechoslovakia and to Holland (The Hague and Maastrict) in 1936. In Paris they appeared at the Gallery Pierre, the Quatre Chemins, and the Gallery de Beaune. The last European exhibition was held in 1939 at the gallery of Peggy Guggenheim in London. The war which blacked out the lights of Europe also put a temporary halt to the explorations of Hayter and his coworkers. On the second day of the conflict, Hayter departed from France, leaving behind him one hundred copper plates and a press, all of which disappeared. Later he learned that the landlord had confiscated them "in default" of payment for the rent of the Paris studio occupied *in absentia*.

Back in England, Hayter accepted an invitation shortly before the fall of Dunkerque to transplant Atelier 17 to New York. In May of 1940 he arrived in the United States. That same summer, before the opening of his studio in New York, he conducted a summer course at the University of California. In conjunction with the course he held an exhibition of his works at the Museum of San Francisco.

In the fall of 1940 Hayter opened his workshop at the New School for Social Research in New York City. The American edition of Atelier 17 soon outgrew its quarters and its director was obliged to move it to larger headquarters in a loft building on East 8th Street. Reginald Marsh '41 and Abraham Rattner have frequented his New York studio to continue with him his renewed researches into the graphic mediums. Isabel Bishop and Douglas Gorsline have also sought to improve their technique through the experiments he conducts. Chagall and Lipschitz, who were with him in the original Atelier 17 in Paris, have rejoined him in America. In addition to his association with the New School where he has been instructor in etching and engraving, Hayter diverts part of his energy to a class he has been holding once a month since February 1945, at the Philadelphia Print Club.

Hayter, who reflects the inquisitive, creative faculties of the artist and the experimental, analytical mind of the scientist, has been "typed" as a line engraver. Despite his extensive work in the graphic medium he maintains that he is, and always has been, a painter. Like milestones his paintings mark the changes in his artistic life, particularly since the establishment of Atelier 17. Of his early paintings he says that he did them "before things started to happen." He refers to them as "*décors*, empty settings." In 1927 he exhibited with the Salon d'Automne, the Salon de l'Escalier and the Indépendents in Paris. During 1928, paintings of his made their appearance at the gallery of the Surindépendents, together with works by Estève, Beaudin, and Lurçat. One of the provisos governing the artists who were permitted to hang their works with the Surindépendents was that they must not exhibit them at other galleries in Paris. Since many painters did not like this arrangement, the Surindépendents were able to exclude those who were content to participate in the exhibitions at the conventional salons. In 1929 Hayter's paintings were exhibited at the Brussels Palais des Beaux-Arts. Although the critics "vilified" them, the "more advanced" public was gratifyingly responsive to the artist's efforts.

The evolution of Hayter's work brought the founder of Atelier 17 closer to the surrealists. Instead of mere visual representation in his paintings he inclined toward images, "related to reality through a kind of dream process." Unlike dreams, however, they could be carefully selected. It has been his contention that, "by their persistence you can distinguish between valid and invalid images. Some fade quickly; others are just as insistent after three months. These, I then feel, are a kind of general image which is part of the collective human subconscious, not just my own subconscious." Hayter's preference for the presentation of what he believes is the "collective human subconscious" as opposed to the purely personal attitude of Dali '40 and his followers, explains the difference between the two major schools of surrealist thinking.

In the November 1944 issue of the *Magazine of Art*, Paul McPharlin '45 described Hayter's qualities as a painter in terms of the equipment of the modern artist. Today's artist looks out upon a world the dimensions of which have been enlarged with the aid of the telescope, the microscope, and the spectroscope of the scientist, as well as by the discoveries of the psychoanalyst. "A whole new dream world, its fringes scarcely parted by the surrealists, opens from the subconscious. A world of portentous shapes, some scarcely to be analyzed at all, arises from the unconscious." These ominous shapes, however, stem from reality. Hayter has shown that they can be the fruit of man's nightmarish physical experiences.

In 1937, when the activities of Atelier 17 in Paris were at their height, Hayter was invited to Spain by a liberal Ministry of Art. That country was in the agony of a civil war, a conflict which reverberated throughout the world. The six-foot *Man-eating Landscape,* which Hayter painted in Spain at this time, is an evocation of the horrors he witnessed as brother often fought against brother. In the surrealist manner he reminds the beholder of the grim extinction which ultimately awaits man in a war-torn world: the painting depicts a prostrate man clinging to the edge of a rock in a barren waste, and moving towards him is a giant molecule whose delicate fan-like skirt is a symbol of the refined cruelty with which it prepares to devour the broken man.

With few exceptions Hayter's prints have been cordially received. His paintings, how-

HAYTER, WILLIAM STANLEY—*Cont.*

ever, have often made him a storm center. In the United States the critics have reacted with varying feelings of enthusiasm, surprise, and dubiousness, and have not always shown themselves to be at ease in the presence of his startling and complex work. After his one-man exhibition of oils at the Bignou Gallery, New York, in April 1941, the art critic of *PM* remarked that "you felt the bombastic force of large broken color patterns strain against each other, the nervous movement of tangled lines. It was like a sea of breaking icebergs. And lurking somewhere was Hayter's subject matter." His prints which appeared in May of the same year at the Willard Gallery also puzzled the *PM* critic, who, however, found them "interesting in content and technique." In May 1943 the Willard Gallery in the same city featured a showing of his carved plaster abstractions and burin engravings. In the latter part of June 1944 the Museum of Modern Art gave over its entire auditorium galleries to a group showing of Atelier 17. At the close of the exhibition in September it was sent on a tour of other cities by the museum. Of this exhibition the art critic Howard Devree wrote on July 2 in the New York *Times*: "The graphics at the Museum of Modern Art reveal the excellence of the craftsmanship but leave me in doubt whether the technical proficiency is not the chief thing to come of the effort, and whether technique is not developed to a point at which science rather than art in some obscure way is served. Certainly my own interest in the work is largely mechanical rather than esthetic." Except for this dissenting voice the exhibition was warmly greeted and many critics commented on the modesty of Hayter, who often neglected to sign his name to his prints, which thus remained known only to the artists who had worked with him in his studio. When his paintings appeared in a one-man show at the Brandt Gallery in January 1945 the art critic of the New York *World-Telegram* stressed the brilliancy of his color and the success with which "both color and line are combined to make paintings of singular strength and power. . . .And the result is an organization in which color and line are so perfectly integrated that neither could stand alone. This is vibrant painting, alive with movement, faultless in taste."

Hayter's prints and paintings are in the permanent collections of the Bibliothèque Doucet in Paris, the British Museum and the Victoria and Albert Museum in London, and the Stockholm and Gothenburg museums in Sweden, as well as in private collections. In the United States his works, mostly prints and plasters, may be seen in the country's leading museums, chief among them the museums of Boston, Philadelphia, San Francisco, and Virginia, as well as the Brooklyn Museum, the Chicago Institute, the Museum of Modern Art in New York, the National Gallery in Washington, D.C., the Fogg Art Museum of Harvard University, and the Lessing J. Rosenwald collection.

The Philadelphia Print Club awarded Hayter the Alfred Noyes Prize in 1943 for his print *Laocoön*. In addition to articles written for publication in France, England, and America, he has been working on a book in his spare time since 1936. Hayter decided to undertake this project after he discovered that, since 1890, no book had been produced on the subject of original line engraving. His will be the history and technique of modern engraving as well as a speculation on its future possibilities, and considerable space will be devoted to Andrea Mantegna and William Blake.

Since 1940 Hayter has been married to the American sculptor Helen Elizabeth Phillips, who has exhibited at the San Francisco Museum. The Hayters now have two children, William and Julian. Of medium build, the artist has blue-gray eyes, light brown hair, and sensitive features.

HEAD, EDITH Fashion designer

Address: b. c/o Paramount Pictures, Inc., Hollywood, Calif.

Couturière to such film stars as Marlene Dietrich, Ingrid Bergman '40, and Claudette Colbert '45 Edith Head has created styles that have won wide popularity outside of Hollywood. As head designer for Paramount Pictures since 1938, she is the first woman to have been appointed to such a position in a major studio.

Born on the film industry's home grounds in Los Angeles, Edith Head was the only child of a mining engineer. Her father's work soon took the family to a Mexican mining town, where the child had no playmates and only a few toys. For amusement Edith, like other little girls, made dresses for her dolls, and even adorned uncomplaining burros. When she was eight years old the family moved back to the United States, living in mining camps in Nevada and Arizona. Thus it was during her childhood that Miss Head learned Spanish and also developed an appreciation of native Mexican and Indian costumes which was to influence her future designing.

Since there were no schools near the camps where the Heads lived, young Edith was tutored at home. When finally she was taken back to Los Angeles and enrolled in high school, she was shy and fearful about her recently acquired arithmetic and history. She continued her study of Spanish in high school, then specialized in languages in college, first at the University of California, where she earned her B.A., later at Leland Stanford University, where she received her M.A. degree.

When she had completed school Miss Head accepted a position as teacher of Spanish at the Bishop School at La Jolla, California. Her next job brought her a bit closer to her designing career—she transferred to the Hollywood School for Girls where she taught French and Spanish. Teaching left Miss Head some leisure time, which prompted her to study art. She had taken some art courses at college, and now she began to attend classes in sculpture, life drawing, and landscape and portrait painting. She studied at the Otis Institute and later at the Chouinard Art School in Los Angeles. An aptitude for drawing, combined with a strong interest in design, led her to do fashion sketches for her own enjoyment.

But, living in the environment of the motion picture (some of her pupils were the children of people in the films), she was attracted by the industry and eventually made her bid for entrance. In 1923 she took her fashion sketches to Howard Greer, then head fashion designer at Paramount. Greer immediately gave her a job as a sketcher. Her first task was to design an enormous waistband to support the palanquin on an elephant's back—she was back again to animal dressing!

There was, however, to be a vast amount of experience for Edith Head between the elephant's waistband and the sarong for Dorothy Lamour, a Head creation of 1936. That first assignment was in the period of spectacular C. B. DeMille '42 costume productions with huge mob scenes. Miss Head designed clothes for the extras of these scenes, costumes only visible for a moment on the screen but nevertheless important. From her experience with historical pictures she acquired skill with period costumes and special textiles. All of this experience impressed upon her the main principle of film designing: "That all clothes must suit the story and be subordinate to it." There was another period when Miss Head designed for "horse operas," clothing a stream of cowboys and cowgirls. Eventually her patience with boots and saddles was rewarded—when Travis Banton succeeded Greer at Paramount, she became his assistant. Then later, when Banton left in 1938 to do free-lance designing, Miss Head was made chief designer, the first chief woman designer in a major studio. By this time she was well grounded in the technique of film designing and ready for the considerable responsibilities of her new position.

The job of dressing the stars for their celluloid lives provides a crowded schedule for Miss Head. As chief designer her duties are broad: she reads the script of each picture under production in order to become familiar with the story and its costume requirements; she next confers with the producer, director, art director, cameraman, and the stars, and, if Technicolor is being used, she must also discuss that angle of the production with the color experts. While she is working Miss Head often has three hundred sketchers, drapers, cutters, and finishers carrying out her ideas. Supervising this large staff, she combines a knowledge of each individual job with the talents of executive and trouble-shooter.

A typical work day for the designer begins at nine, involves designing for various stars in different films, special emergency calls to sets, fittings for Ann Sheridan or Veronica Lake, the soothing of an irate director, and kindred tasks. Each day Miss Head also sees the daily rushes of every picture in production, all in all usually kept busy until after seven o'clock. When author Beryl Williams met Miss Head one day the designer was working simultaneously on "one picture with winter clothes, one with summer clothes, one war picture laid in England, one postwar picture, one musical laid in Mexico—not to mention one 1902 and one 1885 film." Each picture presents particular problems to the designer, historical films requiring special research, but in all pictures the clothes must always conform with the background and mood, not dominate. Miss Head believes that the clothes designer should seek to emphasize the particular beauty of the individual star, not to create fashion plates. Even though she is a designer, she has no wish to start fads, but she is frankly happy if something she has designed is suitable for many women and becomes popular. "Imitation," she observes, "is as pleasant a form of flattery in the designing field as it is anywhere else."

EDITH HEAD

Recalling the early days of her career in Hollywood, a period when designing was "a cross between camouflage and costumes for Superman," Miss Head declares: "We dressed stars like nothing human." Discussing the ornate and often spectacular costumes of that time, she says: "After all, it was the fabulous era and the movies were very young." She credits the Government's war order ("L-85"), which limited the use of material, with curtailing lavishness in films. "L-85 was the greatest boon that ever came to fashion designers in Hollywood," she said in a New York interview in 1944. "It banished super-luxury and brought us all down to earth. . . .Today we create sensible styles for women—the kind they can actually wear." Paramount's sage of fashion believes that "good clothes are not good luck. They are the result of a pretty thoroughgoing knowledge of the people you are dressing." The designer must know, besides the measurements of the woman she is dressing, her coloring, facial contours, and her character. For, according to Miss Head, "what you do with clothes is counterbalance personality. Play it up or down." The September 1944 issue of *Screenland* Magazine carried her ideas on this subject in an article called "Dress Your Type." Using as examples Paulette Goddard, Veronica Lake, Dorothy Lamour, Betty Hutton, and Ginger Rogers '41, Miss Head described the kind of wardrobe she designs for these stars, then advised women of their types to pattern their clothes along the suggested lines.

(Continued next page)

HEAD, EDITH—*Continued*

She cautioned her readers, however, that "no two people can look alike in the same thing."

In the book *Fashion Is Our Business* (1945) Beryl Williams describes the careers of famous American designers, including Miss Head. In discussing this book, the *Saturday Review of Literature* called the story of Edith Head "one of the most challenging" in the volume. Miss Head's pet theory of design is simplicity. However, when the script demands a super-glamorous creation, she complies fittingly, as witness the mink gown worn by Ginger Rogers in *Lady in the Dark* (1944). The motion picture modiste likes Latin-American, Western, and Indian fashions, considering among her main contributions to Hollywood fashion her adaptations of the Spanish camisa (shirt), the rebozo (scarf), and the poncho (cloak). Actresses often buy their Head-designed costumes from the studio for personal use. Ginger Rogers and Barbara Stanwyck always have their clothes designed by Miss Head, regardless of where they are working.

The small, dynamic designer, who likes gardening and swimming, is reported to have one of the best figures among the many well-proportioned Hollywoodians. Her black hair and dark eyes complement her vibrant personality. Accentuating the Latin-American motif even in her own clothes, Miss Head prefers materials woven for her in Mexico, and she wears native Mexican costumes in her home whenever possible. Her basic wartime wardrobe, mathematically contrived, has consisted of four suits, converted into twelve outfits by the use of different blouses and skirts. Her favorite combination of colors is red and yellow; if she had to choose only one color to wear the rest of her life, she thinks now it would be white.

A collector of masks, porcelain cats and antique jewelry, Miss Head also owns one of the most complete collections of authentic Indian jewelry in the country, chiefly Navajo. The designer has retained her fondness for burros—these small animals are her pets on her ranch. She also likes to visit Mexico each year, as well as New York, which she considers the fashion center of the world today. Miss Head has retained her fluency in languages and broadcasts in Spanish via shortwave to South America, recognizing the benefits of closer relationships between the two continents. She also sends fashion sketches each month to Latin America because she believes there is a future there for southern California clothes. Paramount's fashion expert calls her work "the most exciting job in the world." Considering the lighter side of her designing days, Miss Head says she has had the most fun with Mae West, and with Charles Laughton, whom she once had to dress as Nero.

Williams, B. Fashion Is Our Business (1945)

HEAD, WALTER W(ILLIAM) Dec. 18, 1877- President of the Boy Scouts of America; business executive

Address: b. 1501 Locust St., St. Louis, Mo.; h. 4931 Lindell Blvd., St. Louis, Mo.

With the Boy Scouts of America celebrating their thirty-fifth anniversary in 1945, Walter W. Head entered upon his twentieth year as president of the Scouts' National Council. His leadership is, however, only one phase of his activities. Widely known as a business executive, he has been a prominent figure in American financial and insurance circles for three decades, having been on the directorates of insurance companies, banks, and other corporations. In addition, he has been affiliated with numerous civic, charitable, and cultural organizations.

Of humble origin, Walter William Head was born on a farm near Adrian, Illinois, on December 18, 1877. Seven years later his parents, Alfred Walter and Margaret Jane (Lambert) Head, moved to a farm in De Kalb County, Missouri. The father made the journey in a covered wagon while the mother and children traveled by railroad. Young Walter was deeply influenced by his mother, a devout woman who imbued him with a warm, human philosophy of life. Educated in the rural schools of De Kalb County, Head worked his way through a Missouri normal school. He began his career as a teacher in a one-room rural school, and by 1901 he was principal of the public schools of the town of De Kalb, in Buchanan County.

At the age of twenty-six, after five years of teaching and school administration, Head was attracted to a business career. He resigned from a teaching post which paid one hundred twenty-five dollars a month to become acting cashier of the De Kalb State Bank for thirty dollars a month. But this proved a wise change, for the young man was successful in his new field. In 1906 he was appointed State and national bank examiner, a position he held for two years, until his election as cashier of the American National Bank at St. Joseph, Missouri. Endowed with business acumen, he progressed rapidly in the banking world. In 1917 he left the American National to become vice-president of the Omaha National Bank, and president in 1920. He was elected an officer of the National Bank Division of the American Bankers Association in 1918, became second vice-president in 1922, then first vice-president, and president in 1923.

Six years later he became president of the State Bank of Chicago, which was consolidated with the Foreman National Bank, to form the Foreman State National Bank, of which he was elected president. Head moved to New York in 1931, and was elected president of the Morris Plan Corporation of America. He resigned this position in 1933 to take over the presidency of the newly organized General American Life Insurance Company in St. Louis, which purchased the assets of the former Missouri State Life Insurance Company; they were then 50 per cent of the required legal reserve. Under Head's direction the General American Life Insurance Company developed rapidly. *Finance* in April 1944 reported: "In the ten years that have elapsed, Mr. Head and his associates have established a brilliant record in building a great new life insurance company in the heart of the Middle West, serving the holders of more than six hundred fifty thousand policies and certificates. The results he achieved in rehabilitating the business and assets of the former Missouri State Life for the benefit of its policyholders have won the acclaim of insurance executives throughout the Nation."

Since his early days as a schoolteacher Head has had a concern in the matter of community character-building, especially among young people. For twenty-seven years he has been active in the Boy Scouts of America, an organization without racial, religious, political, or class distinctions, having as its aim the mental, moral, and physical development of boys. Since 1926, as Scout president, Head has participated in Scouting activities in every state of the Union and in a number of foreign countries. (Every month he travels to New York to preside at the meeting of the council at National Scout Headquarters.) Late in 1941 the Boy Scouts offered to the Government the services of one and a half million members, who since have completed more than forty war projects requested by various Federal agencies. In early 1945 the organization established a World Friendship Fund, which will be raised among troop members throughout the United States to rebuild Scouting in liberated countries abroad. "For many years," wrote President Roosevelt '42 in a thirty-fifth anniversary message to the Scouts in February 1945, "the Boy Scout movement has been a real force among the democratic countries in helping to promote better understanding among the nations and international good will."

Head's war activities have extended beyond his work as Scout president. In the First War Loan Drive, he was general chairman of the United States Treasury Victory Fund Committee of St. Louis. When Chester C. Davis '40, president of the Federal Reserve Bank of St. Louis, was appointed War Food Administrator in 1943. Head succeeded him as chairman of the War Finance Committee of the Eighth Federal Reserve District. At the time of the First Victory Loan Drive the United States was divided into Federal Reserve Districts. Shortly afterward, when the drive was divided among states, Head became chairman of the Missouri War Finance Committee; in this capacity he led his state over the top by substantial margins in the second to seventh drives. In 1944 Head was elected chairman of the Citizens Committee for Postwar Improvement and Employment in the City of St. Louis. This committee will supervise the expenditure of sixty-three million dollars for a postwar municipal works project designed to provide necessary municipal facilities and employment for servicemen and war workers returning to civilian life. He is also president of the St. Louis USO council and State chairman of the Missouri USO.

Keenly civic-minded, Head has always participated in community affairs wherever he has lived. During his residence in Nebraska, in the years 1917 to 1929, he was a member of the State Capitol Commission which had charge of the construction of the ten-million-dollar Nebraska State Capitol. (He continued as a member during 1930.) He is now director of the St. Louis Chamber of Commerce, a member of the board of the Missouri Social Hygiene Association, an elder in the Second Presbyterian Church, an endowment trustee of the Presbytery of St. Louis of the Presbyterian Church in the United States, and a teacher of a men's Bible class. Also consistent with his long interest in educational matters is his trusteeship of Grinnell College (Iowa), Presbyterian Theological Seminary (Chicago), and Westminster and Lindenwood colleges (Missouri). (He is chairman of the board of trustees of Westminster.)

George Dorrill
WALTER W. HEAD

The executive's numerous connections include his presidency of the Southern Ginning Company and the Missouri Mercantile Company, both of Kennett; his chairmanship or directorship in the Board of American Community Stores Corporation of Nebraska, the Navy League of the United States, and the United States Fidelity and Guaranty Company of Baltimore. He is also a member of the board of Governmental Research Institute, the St. Louis Convention and Publicity Bureau, chairman of the St. Louis branch of the Foreign Policy Association, and a member of the National Board of Directors and National Executive Committee of the National Conference of Christian and Jews, Inc.

Besides meeting his many business and civic responsibilities. Head has found time to write articles for several magazines. In the Hoover '43 Administration he wrote for the *Review of Reviews* on the subjects of Federal Reserve rates, agricultural problems, and politics, in which he militantly supported the right and responsibility of businessmen to participate in politics and government. A stanch Republican, he warmly supported President Hoover. In discussing the political situation of 1931 he said, "We have been idolizing individuals instead of idealizing principles."

The Boy Scouts' executive is six feet one inch tall, and his heavy working schedule has apparently not impaired his abundant energy. He used to devote much of his leisure time to horseback riding, hunting, fishing, and

HEAD, WALTER W.—*Continued*

camping, and he has traveled extensively in the United States, Alaska, Canada, Mexico, the British Isles, and Europe. For relaxation he now periodically visits his farm at St. Joseph, Missouri, where his agricultural pursuits are varied. He is a member of several clubs and societies, including the National Geographical Society and the Academy of Political Science. He is musical, has been a choral singer and pianist, and now serves as president of the St. Louis Grand Opera Association. In March 1900 he was married to Della Thompson; they have one daughter, Audrey Vernelle, now Mrs. Raymond A. Baur.

HERZOG, PAUL M(AX) Aug. 21, 1906- United States Government official

Address: b. National Labor Relations Board, Washington, D.C.

Among the important appointments President Truman '45 made in June 1945 was that of Paul M. Herzog to the chairmanship of the National Labor Relations Board. A prominent New York attorney, Herzog had been active in the field of labor relations since late 1933, serving both in Federal and State positions. He was on active duty as a lieutenant in the Navy from March 1944 to June 1945, when he was released so that he might assume his new office.

A native New Yorker, Paul Max Herzog was born on August 21, 1906, to Paul M. and Elsie (Loewenstein) Herzog. He received his early education in that city at the Lincoln School before going on to Harvard for advanced study. An honor student, Herzog earned his B.S. *magna cum laude* in 1927. He won the Bowdoin Prize that year at Harvard and was elected to Phi Beta Kappa. Beginning his career as a teacher, he was instructor in economics and government at the University of Wisconsin from 1928 to 1930. During this period he worked for his Master's degree which he received from that university in 1930. At this time Herzog returned to his alma mater as a teacher for a year (1930-31). He then entered the Harvard Law School, but his legal training was interrupted in 1933 when he was summoned to Government service in the early days of the New Deal.

Appointed as the assistant secretary of the National Labor Board by Senator Robert F. Wagner '41, he became known as one of the original labor relations "brain trusters." Herzog served on the board during its stormiest days until the dissolution of the NRA. In 1936 he completed his legal training at Columbia University. A Bachelor of Laws, he then joined the prominent New York law firm of Hays '42, St. John, Abramson, and Schulman. After a year of private law practice, however, the attorney was again called into public service upon the formation of the New York State Labor Relations Board in 1937.

After five years on the State board Herzog was named chairman by Governor Herbert H. Lehman '43, the appointment having been urged by the resigning chairman and the third board member. His colleagues recommended Herzog for the position because of his "unique knowledge of the substantive Labor Relations Acts, State and Federal, and because of his unswerving devotion to the democratic policy which inspired their passage, as well as for his warmhearted tact and natural honesty." He was optimistic when he discussed the achievements of the agency. In an interview in 1942 he remarked: "In neighborhood gossip, everybody hears about the couple who fight; no attention is paid to the happy marriages." The labor relations expert added pointedly: "Ninety per cent of cases the board handles are adjusted in informal conferences. There are hearings in one case in ten, but that one case is what the public hears about." The November 1942 issue of the *Annals of the American Academy of Political and Social Science* contains Herzog's article entitled "The Labor Relations Acts of the States," in which the writer presented an historical review of this type of social legislation in the various states, with statistical annotations. He discussed the procedural differences among the states and cited the advantages of such diversity in broad experimentation and experience.

In March 1944 Herzog resigned from the State board to join the Navy. At that time he was accorded the following tribute by Governor Thomas E. Dewey '44: "Under your leadership the State Labor Relations Board has impartially, without fear or favor, built a great record in solving the problem of employers and employees. The board has served as a model of good administration in the settlement and adjudication of labor disputes." The labor relations authority was commissioned a Naval lieutenant and served in the Industrial Relations Section of the Navy Secretary's office in the Capital. Upon his appointment by President Truman to a five-year term on the NLRB in June 1945, Herzog was released

Harris & Ewing

PAUL M. HERZOG

by the Navy. The appointment was unanimously approved by the Senate Committee on Education and Labor on June 14 and was confirmed by the entire Senate the following day. *PM* reported the new chairman is regarded in labor quarters as an outstanding authority in the field of industrial relations.

Commenting on the change in the chairmanship of the NLRB, A.F. of L. spokesmen viewed it as signaling "an era of decreasing labor-representation controversies." The union leaders recalled Herzog's record as a member of the New York State Labor Relations Board and noted his success in avoiding conflicts between the CIO and the A.F. of L. It was further reported that the President's liberal supporters welcomed the choice of Herzog as NLRB chief. Editorially, the *World-Telegram* saw little likelihood of change in the board's policy on foremen's unions, since the writer had found indications in Herzog's record in support of the organizing of foremen. Another writer saw the appointment of Herzog to the board and of Lewis B. Schwellenbach['45] as Secretary of Labor as two important events in labor history. The Ives Committee, a New York group which is interested in industrial and labor conditions, expressed the hope that Herzog's new position "will make his unique abilities and experience available to the Nation in promoting, as he has in New York State, sound industrial and labor relations."

Sworn in as NLRB chairman on July 5, Herzog and other Government leaders took that opportunity to pay tribute to Senator Wagner on the tenth anniversary of President Roosevelt's approval of the National Labor Relations Act. "You can still recognize your child," Herzog remarked to Wagner on the occasion. At the ceremony the new chairman reminded the board staff that they should never forget that the board is a quasi-judicial body and "the servant of all the people of the United States." Herzog further emphasized the board's duty "to protect the rights of millions of wage earners to organize and bargain collectively through representatives of their own choosing." While relieved of his Navy commission, Herzog was "out of uniform but not out of the war"—more than half of the board's cases were from war industries.

It was considered significant that the first important issue on which the new chairman made his views known was the application of the Wagner Act to foremen's unions. Mark Sullivan considered Herzog's majority opinion, written in December, as "temperate in tone and close-reasoned." That opinion was that foremen are employees, not part of management, and as such constitute a bargaining unit. As to the fears of management that organized foremen would be inclined to be more loyal to other employees than to the employer, Herzog said: "Bargaining can only succeed if responsible unions representing supervisory employees, once their legal rights are established, recognize the validity of some of management's special fears and seek to dispel them by the terms of the ultimate bargain."

The industrial specialist is a handsome, six-foot figure, weighing 165 pounds, with blue eyes and light brown hair. A "chain pipe-smoker," he has a large variety of pipes. He was married on April 11, 1929, to Madeleine Straus Schafer, granddaughter of Oscar S. Straus, who was Secretary of Labor in Theodore Roosevelt's Cabinet. The Herzogs have two young children, John Paul and Andrea Elsie. A member of the Harvard Club of New York, he also belongs to Harvard's Signet Society, and the Cosmos Club of Washington. He likes classical music and indulges a fondness for photography and baseball.

HICKMAN, EMILY (GREGORY) July 12, 1880- Educator

Address: b. c/o New Jersey College for Women, New Brunswick, N.J.; h. 27 Seaman St., New Brunswick, N.J.

The exclusion of women from the 1944 Dumbarton Oaks conference on postwar planning for peace prompted women's organizations throughout the United States to prepare a campaign for inclusion of their sex in all future international conferences. One of their first acts was to make public a list of American women qualified for membership in any international body. On this list was the name of Emily Hickman, veteran world peace crusader and professor of history at New Jersey College for Women, who in April 1945 was appointed an aide to John S. Dickey, public liaison officer at the San Francisco conference.

Born in Buffalo, New York, on July 12, 1880, Emily Gregory Hickman is the daughter of Arthur Washington and Alice (Gregory) Hickman. The Hickmans, their six children, and grandparents and aunts made a group of thirteen at the family dinner table—a table which creaked under its bountiful load in those lush, nonrationed days before the turn of the

Mabel H. Wells

EMILY HICKMAN

century. "A strawberry shortcake, the family's favorite dessert," recalls the professor today, "was so big that eating it was a rite." From this happy girlhood home in Buffalo, Emily Hickman went to Cornell University, where in 1901 she was granted a B.A. degree. In 1908-9 she studied on a fellowship at Cornell, in 1909-10 on a fellowship at Yale. The following year she was awarded her doctorate from Cornell, and the same year became a member of the history department at near-by Wells College (Aurora, New York). In 1927 she left Wells for a professorship in the history department of New Jersey College, the distaff side of Rutgers University in New Brunswick.

The professor's students have said that she is a teacher who succeeds in prodding the minds of the indifferent members of her classes, arousing them with her lectures on the development of Western thought, or by her terse comments on the subject which concerns her very much, American isolationism after the First World War and the failure of the United States to support the League of Nations. When there is opposition to her convictions on the organization of the nations of the world for peace, the customary twinkle in her eyes, it is said, disappears quickly. In keeping with this interest in world affairs is her direction of the International Relations Club at the college. Every two weeks she has been accustomed to entertaining at her home a discussion group of twelve girls from her classes. From the students' point of view, a feature of these evenings is the hot beverage served from the cups and saucers which are a part of the collection Miss Hickman has gathered in her world travels.

Miss Hickman's work on behalf of world peace began in 1925, when she became a member of the Committee on the Cause and Cure of War, founded by Carrie Chapman Catt ['40]. Acknowledging that the well known feminist has influenced her more than any other person has done, Miss Hickman says that she has followed the advice Mrs. Catt gave her at their first meeting—to "stick" to the peace movement. Since those days she has made two transcontinental lecture tours of the United States under the auspices of the Carnegie Endowment for International Peace (1938-39), and she has become associated with a number of organizations working for international cooperation. Among these are the Committee to Study the Organization of Peace and the United Nations Association of New Jersey. She is chairman of the commission on a world community of the National Peace Conference, and of the Committee on Participation of Women in Postwar Planning.

This last-named organization was brought into being by Mary E. Woolley ['42], president emeritus of Mount Holyoke College, in Massachusetts. Realizing that women would not be asked to sit at any of the international conferences after the Second World War unless they forced the issue, Miss Woolley called a meeting in 1944 of representatives from thirty women's organizations. Twelve of these were represented at the first meeting of her Committee for the Participation of Women in Postwar Planning; sixty-one others soon became interested. This committee is now supported by such groups as the National Association of Women Lawyers, National Board of the YWCA, National Council of Jewish Women, National Council of Negro Women, Women's Action Committee for Victory and Lasting Peace, Federal Council of Churches of Christ in America, Women's International League for Peace and Freedom, Zonta International, Farmers' Educational Bureau, Women's Overseas Service League, and the National Council of Women of the United States. The membership represents millions of women; the YWCA alone has a membership of over a million.

Because Miss Hickman was influential in many women's organizations and a recognized authority on international affairs, she was given the chairmanship of the new committee. (Elderly Miss Woolley is living in retirement at her New York State home, although she attends meetings.) It has been a strenuous assignment for the New Jersey professor, a doubling of her already heavy schedule. Four or five days a week she regularly travels to New York City after teaching her classes at the college. Her long day ends near midnight.

When Miss Hickman first took over the chairmanship she explained: "What we are going to do specifically is to nominate women who will be qualified for membership in any international body. They will be able to sit with any international conference now being planned, for we are going to select those who are trained for such duties." To this end, a double committee was set up in Washington, D.C., to deal with the plans of the United States Government for international conferences and all phases of Pan American affairs. Miss Hickman has also pointed out that the task of getting women appointed to conferences in foreign lands has resulted in contacts with women in the governments-in-exile.

Women can note with satisfaction that members of their sex have already been recognized to some extent in postwar planning. Miss Josephine Schain '45 of New York was a delegate to the international food conference, Mrs. Ellen S. Woodward of Indianapolis and Mrs. Elizabeth A. Conkey of Illinois were delegates to the Atlantic City UNRRA conference, and Virginia Gildersleeve '41, dean of Barnard, Ruth Bryan Owen Rohde '44, and Miss Hickman herself were sent to the United Nations conference in San Francisco. As the two women members of a staff of six, Miss Hickman and Mrs. Rohde were named by John Dickey, director of the Office of Public Affairs of the State Department, to act as aides to the United States delegation. They were assigned to liaison work between the Government and forty-four civilian organizations. "Cooperation can prevent war," the New Jersey aide declares. "We'll have to establish an international law-making body and an international police force. . . .[And] women are going to help find the way."

In addition to holding membership in several peace organizations, Miss Hickman is a member of Phi Beta Kappa, the American Association of University Professors and the American History Association, and she is chairman of the Public Affairs Committee of the National Board of the YWCA. She has contributed articles to the *Dictionary of American Biography* and the *New England Quarterly,* and book reviews and editorials to the *Woman's Press.* For many summers the professor lectured at Cornell (1918-25), University of Colorado (1928, 1929, 1931), and Rutgers (1930). She is described as a small woman, with wide-set gray-blue eyes and graying hair frequently topped by perky hats. The internationalist likes to cook; she usually finds time to prepare her breakfasts and a week-end meal. For relaxation she works in the garden of her New Brunswick home.

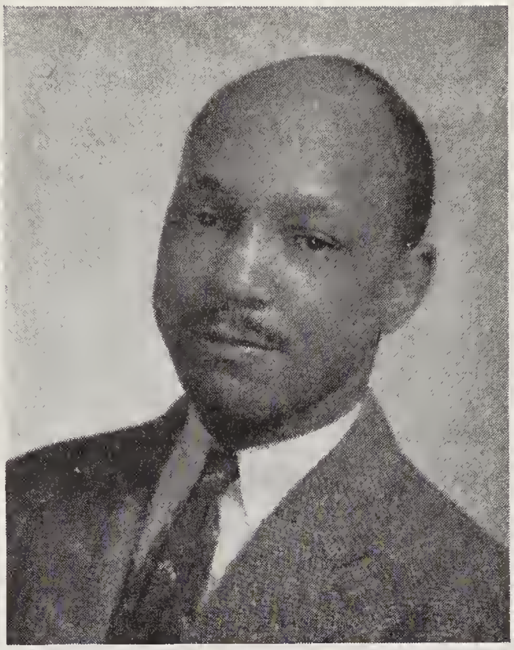
HILL, ABRAM Jan. 20, 1911- Theatrical director; playwright

Address: b. American Negro Theatre, 15 W. 126th St., New York City

Abram Hill, playwright-director of the important experimental American Negro Theatre, was born January 20, 1911, in Atlanta, Georgia. He is one of the five children of John and Minnie (Hill) Hill. Their identical surnames notwithstanding, his parents were not relatives. Mrs. Hill's maiden name stems from a family of slave-holding Hills who owned "about half" of Wilkes County, Georgia, and who had purchased Abram Hill's maternal great-grandmother in 1812, when she was only seven years old. She was more than a hundred years old when little Abram used to visit her and listen to her descriptions of her early days. From her he imbibed a respect for history which won for him the highest grades in his history courses. The boy's father was a fireman on the Seaboard Air Line Railroad. After the Government took over the railroads during the First World War, part of the Federal salary somehow found its way out of the Negro railroaders' pay envelopes before it reached them. John Hill led the successful protest to Washington, but after the war things were made so unpleasant for him by the local authorities that he left the railroad and became a house painter. Mrs. Hill for her part "did some sewing on the side."



ABRAM HILL

Young Abram had been attracted to the stage when he made his first amateur appearance in the near-by Morehouse College chapel at the age of seven. But when he was fourteen pneumonia which kept him in the city hospital for eight weeks made the boy decide to become a surgeon. This pleased his parents, to whom success meant being a doctor, lawyer, or dentist, and it was by emphasizing the greater educational opportunities in New York that Abe persuaded his parents to move there in 1925. In New York he attended the Theodore Roosevelt High School for a time, but was graduated in 1929 from the De Witt Clinton High School. Then he went to work as an elevator operator in Macy's department store (1929-31). While taking a premedical course at the College of the City of New York (1930-32), he continued to work at Macy's and, in 1931-32 he was a photographer's assistant. He has supported himself also, according to Mary Braggiotti's article in the New York *Post,* as a hotel clerk, sandhog in the Westchester water tunnel, factory worker, and delivery boy. In his spare time Hill wrote a number of short stories and a

HILL, ABRAM—*Continued*

novel, "The Crystal Casket," but these were not published. In 1932, too, he became drama coach at St. Philip's Protestant Church and the Abyssinian Baptist Church.

In 1934 Hill entered Lincoln University in Pennsylvania to continue his medical course, but instead he was persuaded to take English and drama, and he won the Charles W. Conway Prize in English. Professor J. Newton Hill recognized student Hill's talent and "literally turned over the Little Theater" to him. And Hill spent all his free time writing, staging, directing, and experimenting. The professor gave him individual advanced work, and when Hill received his B.A. in 1937 he was retained for a semester as faculty assistant in drama. While he was at Lincoln the play production budget was quadrupled. During the summer vacations he served as dramatic director for the CCC unit at Camp Upton, Long Island. "In trying to find suitable material to stage for CCC camp shows," Hill recalls, "I had to turn to established plays, and soon adapted them to Negro life. . . .My drama group won the second highest honors in the Second Corps Area." (He had been made assistant State supervisor of CCC camps in 1935-36.)

After leaving the university the twenty-six-year-old director joined the Federal Theater Project; it had taken over the TERA State Board of Education program under which he had worked with the CCC. "It wasn't long before my talent was brought to the attention of Hallie Flanagan, national director," he says. He was assigned to her office and set to write the "case history of the Negro" in the Living Newspaper style originated by the Federal Theater. His first version, "Liberty Deferred," "created a mild furor in Federal Theater circles," but the eventual withdrawal of Congressional funds prevented it from reaching the stage. Plays involving Negro characters were turned over to Hill to read and review, and he claims to have prevented production of at least six, such as Octavus Roy Cohen's *Come Seven,* which he said gave a distorted picture of Negro life. Eventually all plays suggested were turned over to him for consideration.

Theresa Helburn '44 of the Theatre Guild had been greatly impressed by Hill's three-act play *Hell's Half Acre* (1937), inspired by his great-grandmother's reminiscences of slavery, and it was put on twice: by the Unity Players in the Bronx, and by Joseph Ornato. Another Hill play, a satire called *On Strivers' Row* (1939), was first produced in Harlem by the Rose McClendon Players and ran for sixteen performances; produced by the American Negro Theatre in 1940, it ran for 101 performances, the longest run thus far of any ANT play. (It is considered Harlem's favorite play.) Miss Helburn advised the young playwright to study his craft further, and he accordingly took courses at the New School and summer work in theater art at Columbia and Atlanta universities. Hill's work at the New School won him a scholarship from Miss Helburn to the same school, where he studied under John Gassner and in the same class with Tennessee Williams. Erwin Piscator nearly produced one of Hill's plays, but it had to be dropped because of casting difficulties.

After the dissolution of the Federal Theater project in 1939 Hill tried the commercial producers. "All said I was promising," he explains. "I got to a point where I couldn't live on promises. . . .In desperation I went to the National Association for the Advancement of Colored People and tried to interest them in doing something about the Negro theater." Acting on the suggestion of the NAACP's public relations counsel, he attempted to organize the Negro playwrights into a production company. After two months of work on this, however, Hill resigned, "quite broken-hearted over the Negro Playwrights Company's lack of vision and practical planning." In 1940-41 Hill was a researcher for the Federal Writers Project. He was accepted by the Yale School of Drama, but could not enroll because he lacked the tuition fee. Thereupon he decided to plan a theater group in New York City, and began to study the history of past efforts to organize a Negro theater and to analyze the reasons for their failure.

The result was that Hill made the first effort toward bringing about the organization of the American Negro Theatre by calling into session seven other interested persons. This body finally laid the plans for the organization's operation. In June 1940 the ANT was launched. "We had no money—only enthusiasm," Hill says. The company roster included a few professional actors, players of butler and maid parts, but most of the thirty were amateurs who rehearsed at night. Among them were teachers, typists, clerks, and domestic servants. Frederick O'Neal, founder of the Aldridge Players, the successful Negro community theater in St. Louis, was elected manager and Hill became director. The "ANTies," as Hill calls them, found a home in the small but new basement theater of the Harlem branch library; but library rules required that they leave by eleven each night.

Nevertheless, the company began rehearsals. Their first production was Hill's *On Strivers' Row,* written in 1939. But, like most experimental theater groups, the ANT's cooperative workshop felt the lack of suitable material. Hill therefore obtained permission to adapt certain plays to his needs. One of these was the Ephrons' *Three Is a Family,* where the only shift required was that of locale. Another was an unproduced play about Polish-Americans by Philip Yordan. Hill saw promise in it after forty-four Broadway producers had turned it down and took the script to Harry Wagstaff Gribble '45, who, upon Hill's request, accepted the directorial duties for its production; he and Hill added a prologue and epilogue and made a few other changes in Yordan's play. Under Gribble's direction, the company rehearsed for three months, and in June the ANT presented the play—*Anna Lucasta,* with Hilda Simms '44 in the title role. The budget for the production came from ANT's own treasury, the Rockefeller Foundation General Education Board's grant of ninety-five hundred dollars not having been available until two weeks after the opening. (In December 1945 another grant of twelve thousand dollars from the Board was announced. To be utilized over a two-year period, it provides for a full-time salary for Hill, thus allowing him time to raise funds for the building of ANT's own playhouse, a project he hopes will be realized in a few years.)

It is said that critics, motion picture representatives, and actors' agents had been visiting the ANT since its opening, but not until *Anna Lucasta* did the general theater-going public hear of it. Wilella Waldorf praised the play in the New York *Post*, and Burton Rascoe wrote in the New York *World-Telegram*, "I got one of the greatest thrills I have ever had in many years of playgoing [at the ANT's cramped basement playhouse]. . . .You have never seen better acting in your life . . . [but] the importance of *Anna Lucasta* is that . . . it is not the usual white theatrical exploitation of the Negro as a . . . 'colorful', 'quaint,' or 'charming' character, but is a serious story of average human beings (all highly individualized), who happen to have pigmented skins." *Anna Lucasta* was transplanted to Forty-seventh Street, minus the prologue and epilogue, under John Wildberg's aegis, and immediately established itself as a definite hit, with five members of the ANT cast playing their original roles (O'Neal was one of them). The ANT received 1¼ per cent of its weekly gross, which was earmarked for the theater the cooperative group intended to build in Harlem, near the source of its talent.

Meanwhile Abram Hill was working on the sixth ANT production, *Walk Hard,* which he had dramatized from Len Zinberg's novel *Walk Hard, Talk Loud.* It began a six-week engagement in November 1944 with a cast of nine Negro and nine white actors. Before the opening Hill told an interviewer he had already had many requests for the script from Broadway agents, but said, "It's a play with a message. Of course the audience won't get socked over the head with it, but it's there, so I'm not sure if *Walk Hard* is cut out for the $4.40 trade." *Walk Hard* was also produced in Providence. Other ANT productions, not directed by Hill, include *Natural Man, Starlight, Garden of Time*, and *Henri Christophe.*

The ANT is a cooperative group, sharing equally in the profits. "In directing," says Hill, "I strip actors of all their mannerisms, habits, and clichés, and drive them into the characters they are interpreting. Lines only serve to indicate the three dimensions of a character. Once they have been learned, they should literally be forgotten. I spend weeks helping the actor find the character—every detail of his background, the logic of his behavior, and the logic of the audience's emotional reaction. Then we drill and drill for character until the actor doesn't act, he's just naturally the person he is supposed to be. This may take months, but the results can be sensational. After we get a naturalness in the character, we become strictly technical—driving for rhythm, tempo, pace, movement, picturization, motivation, balance, focus, emphasis, overtones, undertones, meaning, mood, etc. In the end we get what ANT is widely known for: naturalness, rhythm, and vitality, which we are experimenting with. . . .As a director and a playwright, I have tried to bring about a balance in the Negro theater. Most big-time commercial productions on race themes have dealt with only about 10 per cent of the Negro people—as a rule the exotic lower depths. All I'm trying to do is introduce a few of the other types who run the gamut from the professionals, middle class, and the everyday Dicks, Toms, and Harrys."

Hill has a regular job as drama editor of the *Amsterdam News.* Of his playwriting he says, "I hit out on any theme or situation or character that moves me. It is all inspirational—it comes to me when I least expect it." He has written several plays in addition to those mentioned, and in 1945 he was editing an anthology of ANT plays and writing a history of the group. In that year, too, Hill was given one of the Schomburg awards and one of the three Riverdale Children's Association awards for promoting interracial understanding.

Abram Hill is six feet tall and slender (his weight is one hundred and sixty-five pounds); his receding hair is close-clipped, his nose somewhat aquiline, and he wears a mustache. Besides his writing, which is "torture" but which he loves, Hill gives his interests as going to the theater (but not to musicals or motion pictures) reading, dancing to music, "hot, cold, and jitterbug," bicycling, horseback riding, good music, and conversation.

HODGE, JOHN R(EED) June 12, 1893- United States Army officer

Address: b. c/o War Department, Washington, D.C.; h. 808 S. Illinois Ave., Carbondale, Ill.

"The six weeks after March 26, 1945, carried the Allied arms triumphantly from the Rhine to the Elbe, into Czechoslovakia, to the Brenner Pass, and to total victory over Nazism. The same six weeks barely brought the United States Tenth Army into the outskirts of Okinawa's obscure little capital city. . . .There have been struggles in Europe involving greater battlefields, greater concentrations of men and guns, and of greater strategic significance, but with the possible exception of Stalingrad there has been nothing to surpass the Okinawa battle in sheer fury." The greatest share of this fighting fell to the Twenty-fourth Corps of Lieutenant General John R. Hodge, a veteran of the South Pacific war and former leader in the first United States Army troops to take the offensive

LT. GEN. JOHN R. HODGE

against the Axis in any war theater. After the surrender of Japan he was made commander of the American Army of Occupation in Korea.

John Reed Hodge was born in Golconda, Illinois, on June 12, 1893. He is the son of John Hardin and Melissa Caroline (Steagall) Hodge. At nineteen he entered Southern Illinois Teachers College, where he studied in 1912-13. In May 1917, after having attended the University of Illinois, where he studied architectural engineering, he went to the Army Officers' Candidates School at Fort Sheridan, Illinois. Completing the course in August, Hodge was commissioned a second lieutenant in the Infantry Reserve and joined the Sixty-first Infantry at Gettysburg, Pennsylvania. That October Lieutenant Hodge was married to a Pennsylvania girl, Lydia Gillespie Parsons of Punxsutawney; and three weeks later the twenty-four-year-old Illinoisan was given a Regular Army commission and promoted to first lieutenant (temporary).

In February 1918 Hodge was transferred from Fort Greene, North Carolina (to which he had come in November of the previous year) and sent overseas to France the same month as a member of the advance detachment of the Fifth Division. After a two-month course at the Signal School at Langres he rejoined the Sixty-first Infantry as signal and liaison officer in May, later commanding a company. Hodge served in the First World War in the Anould and Saint-Dié sectors, and took part as an obscure junior officer in the Saint-Mihiel and Meuse-Argonne offensives. When the war ended he was a captain (temporary), and in April 1919, while his regiment was in Luxembourg, he was made a permanent first lieutenant, retaining his temporary grade of captain.

The Sixty-first returned to the United States in August 1919 and was assigned first to Camp Gordon, Georgia, and then to Camp Jackson, South Carolina. In October 1921 Captain Hodge (promoted to permanent grade in July 1920) joined the faculty of Mississippi Agricultural and Mechanical College as professor of military science and tactics. Four years later the professor went back to school himself—at the Infantry School, Fort Benning, Georgia. After his graduation in May 1926 he was kept at Fort Benning for temporary duty, and in October 1926, he reported to Schofield Barracks, Hawaii, to join the Twenty-seventh Infantry. A year later Hodge was appointed plans and training officer of the Twenty-second Infantry Brigade.

In October 1929 the thirty-six-year-old captain returned to the United States and was assigned to the Eighteenth Infantry at Fort Hamilton, New York. Later he was chosen for intensive advanced training. From February to April 1932, Hodge was a student at the Chemical Warfare School, Edgewood Arsenal, Maryland; four months later he began the two-year course at the Command and General Staff School at Fort Leavenworth, Kansas. Next came a year at the Army War College in Washington, D.C. In August 1935, after a two months' leave, the Infantry officer was promoted to major and detailed to the Air Corps Tactical School, Maxwell Field, Alabama. The faculty there included the future Generals Lawrence S. Kuter, Harold L. George '42, and Haywood S. Hansell '45. Graduated in June 1936, Hodge had several months' duty commanding a battalion of the Twenty-third Infantry at Fort Sam Houston, Texas, before joining the War Department General Staff's Operations and Training Division, G-3, in late December.

That year of 1936 saw the founding of the Rome-Berlin-Tokyo Axis and the start of a world-wide armament race. The United States, as a traditionally nonmilitaristic nation, had cut its Army expenditures to the minimum, resulting in small and unbalanced armed forces. For over four years Major Hodge worked on a General Staff operating under this handicap, which had to integrate the greatest peacetime military expansion in American history and to prepare the country's military plans in case it should be drawn into the European war. Hodge was promoted to lieutenant colonel in 1940. In February 1941, already held past the normal four-year detail on the War Department General Staff, Hodge joined the newly organized Seventh Army Corps in Birmingham, Alabama, as plans and training officer, G-3, of Corps.

In December 1941 Hodge was promoted to colonel (temporary) and became chief of staff of the Seventh Army Corps, removed to the West Coast upon declaration of war, which means that he supervised all the routine work of personnel, intelligence, operations and training, and supply for the commanding general. Six months later, in June 1942, he was promoted to brigadier general (temporary) and made assistant division commander of the Twenty-fifth ("Tropic Lightning") Infantry Division, which was then in the Pacific area. This division moved to the South Pacific in November-December of 1942, coming under the command of Major General Alexander M. Patch '43, and relieved marines on the British-owned island of Guadalcanal. In the months since the marines had first reached Guadalcanal under Major General Alexander A. Vandegrift '43 in August 1942, they had written in blood a classic story of heroism. But Guadalcanal was still officially a "Navy show," and the troops were therefore under the over-all strategic command of Admiral William F. Halsey '42. Finally on February 9, 1943, after careful preparatory measures and an intensive drive which lasted thirty days, General Patch's headquarters announced the "elimination of Japanese resistance" on Guadalcanal—the "complete rout and utter defeat of a Japanese army which executed a nonorderly withdrawal."

In late April 1943 John R. Hodge was promoted to major general (temporary) and was assigned to command the Americal Division. That July he was called for relief command of a division which had been in continuous action against the Japanese in New Georgia for almost thirty days and had suffered heavy casualties. "Under his aggressive leadership," says the citation for Hodge's Distinguished Service Medal, "the division was revitalized and continued the offensive with the zeal of fresh troops, taking its assigned objective in the minimum of time. General Hodge inspired his troops by his constant presence at the front and was primarily responsible for the forward drive of the division which brought the entire operation to a successful conclusion" in August.

After this, Hodge returned to command the Americal Division, which had been activated in May 1942 to hold off the Japanese on New Caledonia. This, the only American division organized overseas, was the first Army unit to take the offensive in the Second World War, and is the only one officially distinguished by name instead of by a number. ("Americal," a combination of "America" and "Caledonia," was originally suggested by an Infantry sergeant.) These men were veterans of Guadalcanal when Hodge assumed command. On Christmas Day 1943 the Americal landed on Bougainville Island, also in the Solomons group, and in January 1944 the Army commander in the South Pacific, Lieutenant General Millard F. Harmon '42, announced that Hodge's division had replaced the Third Marine Division fighting the Japanese Seventeenth Army on Bougainville. After beating back a major Japanese counteroffensive aimed at the destruction of the three Americal strategically important airfields near Bougainville's Empress Augusta Bay, the American troops achieved what was described on April 3, 1944, as a complete victory. Following this they remained in that area, continuing protection of the airfields and training for future operations.

In April 1944 Major General Hodge was transferred to the Central Pacific Command and was assigned to command the Twenty-fourth Corps. This included, among others, the Seventh Infantry Division, veterans of Attu and Kwajalein, and the newly activated Ninety-sixth recently from the West Coast. For five months Hodge supervised training and loading out of Army units for operations against the Marianas and Palaus and prepared his corps for the invasion of Yap Island in the western Carolines. Toward the end of the typhoon season, when troops assigned for this operation were actually on board the ships and leaving the island waters, there was a last-minute change of plans. The naval air attacks by Vice-Admiral Marc C. Mitscher's '44 fast carrier Task Force 58 had proved so successful that the leaders decided to invade the Philippines immediately. After a complete change in plans and several thousand miles of travel General Hodge and his men therefore found themselves in the largest Pacific convoy seen to that date, and commanded by Vice-Admiral Thomas C. Kinkaid '44 After they hit the beach of Leyte Island early on October 20, theater commander Douglas MacArthur '41 was in personal command of the land forces, comprising "elements of [Lieutenant General Walter Krueger's '43] Sixth United States Army, to which were attached units from the Central Pacific with supporting elements."

During the Leyte operations "General Hodge's dynamic leadership and constant bold extension of activity kept all elements of his command at a high pitch of aggressive effort" —to quote the citation accompanying the second-award Oak Leaf Cluster on his Distinguished Service Medal. General Hodge's drive west from Dulag-Tanauan beaches in the southern spearhead of the offensive was through dense banana groves, cornfields, and rice paddies, the latter described as chest-high swamps through which the men had to wade under Japanese sniper fire, and against heavy rains and strong winds which "turned the dirt roads into slick, treacherous traps for the motorized equipment." One twelve-mile march by spearheads of the Seventh Division, the longest one-day advance of the campaign, took ten hours and was described by newsmen as a test of endurance. The Ninety-sixth Division under Major General James L. Bradley accomplished what has been described as unbelievable feats in clearing the enemy from the coastal plains in the north part of the wide zone of action and destroying hostile forces which were driven into the mountains in north central Leyte. American losses in the bitter fighting were, however, less than one-tenth the Japanese casualties, General Krueger reported.

In mid-November the Eleventh Airborne Division commanded by Major General Joseph M. Swing joined Hodge's Twenty-fourth Corps, entering combat in the drive through the Jap infested mountains and meeting the Seventh Division. The airborne division "wrote new history in the annals of jungle and mountain warfare," supplying itself by parachute, evacuating wounded, and preventing the enemy reinforcements from reaching the Americans' vital airfield area.

In late November the Seventy-seventh ("Statue of Liberty") Division, veterans of Guam, under Major General Andrew Bruce, joined Hodge's command. It was almost immediately loaded for an amphibious assault and in early December landed south of the large port of Ormoc on the west coast of Leyte. The Seventy-seventh thus cut off the Japanese forces opposing the Seventh and the Eleventh Airborne Divisions to the south and pushed on toward Ormoc, capturing it three days later. This was the last important Nipponese base on Leyte Island, and with it the main enemy supply depots fell to Hodge's men. The Seventh closed the gap by strong attack to the north and four days later took over mopping up the Ormoc area, relieving the Seventy-seventh to drive on to the north end of Ormoc Valley and join forces with the First Cavalry Division under Major General Verne D. Mudge, trap-

HODGE, JOHN R.—*Continued*

ping many thousand of enemy troops. Meanwhile, the Eleventh Airborne Division completed cleaning out the enemy in the mountains to the south and the Ninety-sixth had destroyed all enemy in its zone. On Christmas Day 1944 the Seventy-seventh Division captured Palompon, a small Japanese port on the western peninsula of Leyte and the campaign was officially declared at an end. In the words of General MacArthur, "The completeness of this destruction has seldom been paralleled in the history of warfare. General Yamashita has sustained perhaps the greatest defeat in the military annals of the Japanese Army."

General Hodge was next heard of in connection with the invasion of Okinawa, chief of the Ryukyu Islands, on Easter Sunday, April 1, 1945. The Tenth Army of Lieutenant General Simon Bolivar Buckner '42, which went ashore from a fourteen-hundred-ship convoy after a ten-day sea and air attack, was made up mainly of Hodge's Twenty-fourth Corps and the Marine Third Amphibious Corps under General Geiger '45. (The Kerama island group, eighteen miles west of Okinawa, had been cleaned up by Hodge's Seventy-seventh Division three days earlier.) Airfields taken during the first day were immediately put to use: Okinawa, nearly seven thousand miles from the United States, is but three hundred and sixty miles from Japan—two hours by bomber—and a similar distance from China and Formosa. In view of the island's obviously great strategic value, it was cause for wonder that the Japanese commander allowed an "incredibly easy" landing. By the second day some of General Hodge's troops were almost ten days ahead of schedule, meeting no strong or organized resistance, and had cut the island in two by driving to its east coast. "It is going far better than our wildest dreams," Hodge declared. "If they [the Japanese] had elected to hold in high ground in the middle of this area they could have given us plenty of trouble. I do not know why they gave us such a present but we are pleased to have it."

Within a week after the first landings Japanese resistance stiffened in a place where the narrowness of the island made it difficult for Hodge to maneuver his corps or to use its strength in any way but the costliest, frontal assault. There the Japanese fought with bitter tenacity from positions reported "as clever and intricate as anything devised by the Germans." Declared one high-ranking officer, "We've never seen a more elaborate organization of defense. It may take three months to clean up." For the first time in the Pacific war, also, the Japanese used massed artillery, although the Americans reportedly returned about ten shells for every one received.

On April 15 the Twenty-seventh Division "New York's Own," veterans of Saipan and famous in the First World War, was identified in Hodge's corps, which was throwing back one counterattack after another as it continued a slow advance. One hill was taken and retaken eleven times before the Americans finally secured it. Even the weather had turned miserably wet with only short periods of sunshine. (Among the casualties was the war correspondent Ernie Pye '41, killed with Seventy-seventh Division troops advancing on the little island of Ie Jima, off Okinawa.) On April 19 Hodge, after regrouping his forces and building up supplies, opened a grand offensive toward the capital, Naha, but after a month's fighting, in General Buckner's words, it was still necessary to root the Japanese out "with blowtorch and corkscrew" in a campaign described as one of "nagging slowness and brutal exhaustion."

By the end of May, by which time the Ninety-sixth Division had completed the capture of the enemy's eastern hold to the Shuri position, Hodge announced that the main Japanese defenses had been "busted" after sixty-one days of bitter fighting. It was then only a matter of time and a continued dogged advance until the Battle of Okinawa would be over. That fighting ended on June 22, when organized resistance on the part of the enemy ceased—all had been killed or captured, or had committed suicide. With victory in sight, Lieutenant General Buckner '42 was killed four days earlier while observing at the front. The cost of victory was high when compared to other battles in the Pacific, but the gain was considered tremendous—the enemy had lost well over one hundred thousand and the Americans had gained a strategic base on the threshold of the Japanese homeland. Near the end of the Battle of Okinawa General Hodge was officially informed that he had been promoted to the temporary grade of lieutenant general.

After the fall of Japan the task of bringing order out of chaos in southern Korea was assigned to General Hodge as commander of the American Army of Occupation. On September 9 he accepted the surrender of half of an estimated 375,000 Japanese troops in Korea, while the other half was in northern Korea, governed by Russia under the terms of the Potsdam agreement. The Koreans, who had been promised their independence at the Cairo conference "in due course", were especially bitter after the generation-long rule by the Japanese. Consequently, there was wide protest when Hodge, acting under directions to maintain existing Government machinery until the American occupation was completed, retained Japanese officials in administrative work. The press in the United States also voiced considerable opposition to the plan, although Hodge made it clear that the Japanese would have no independence of action, and that the political situation was chaotic with "many factions, each claiming the largest representation and pointing the finger of collaboration at the other." General MacArthur in Tokyo issued a proclamation, assuring the Koreans that their rights would be protected. However, street demonstrations in the Korean capital of Seoul continued until the Japanese governor general was removed on September 12. He was replaced by Major General Archibald V. Arnold, the American general, and Washington announced that all Japanese in governmental positions in Korea would be replaced as rapidly as consistent with safe operations.

In commenting on the difficulties with which Hodge was confronted, *Time* pointed out that occupation of Korea had had to be organized "in tearing haste, by combat-weary men driving themselves fifteen hours a day and more, trying to get a country of twenty-five million people rolling again." At the end of the first month Hodge was able to announce progress in putting occupation plans into effect. He stated that up to October 8 an estimated forty thousand Japanese Army and Navy personnel had been returned to Japan, and it was expected that Korea would be cleared of Japanese soldiers by November 1. He also reported that, although the American military governmental staff was still "seriously undermanned," there had been a revision downward in the number of occupation troops, due chiefly to the "speedy removal of the Japanese and the encouraging degree of Korean cooperation." The job facing Hodge, the New York *Times* pointed out, "was not one of restoring a government, but, with the help of the Koreans, of building an entirely new political structure from the ground up." The "enthusiasm and sincerity of the efforts being made by the Koreans," concluded the report, "is one of the most encouraging signs that this goal is now attainable. With little more than textbook understanding of what democracy really is, they are bravely facing the huge task." The more than one hundred political parties which were reported to exist when the Americans arrived were consolidated into twelve at the request of Hodge. He then interviewed two members of each of the twelve parties on their plans for Korean government, and asked them to submit recommendations for government bureau heads, the equivalent of cabinet ministers.

Meanwhile, Koreans continued to protest bitterly against the trusteeship set up by the Moscow Conference of Foreign Ministers. The problem was further complicated by conflict between the Korean Leftist and Rightist groups. Scattered rioting and strikes were the outward signs of the tense situation. Another aspect of the occupation problem was the division of the country into the industrial north and agricultural south, occupied, respectively, by Russians and Americans. By December, when efforts to eliminate the artificial barrier were under way, Hodge said: "Problems to be negotiated include the opening of communications, unification of the economic life of Korea and the exchange of goods and freedom of travel between the two zones." Before the end of the year, too, the Koreans had set up a provisional government headed by Kim Koo, and Major General Archer L. Lerch '45 had succeeded General Arnold as military governor.

Like other Army people, General and Mrs. Hodge have no permanent home, but live wherever he is stationed in time of peace, and she stays wherever she is stranded in time of war. They have one daughter, Barbara Anne (married to Air Force Lieutenant Hall, who piloted B-24 planes in Europe), and a grandson. Hodge is a member of the University of Illinois Chapters of Sigma Tau and Tau Beta Pi fraternities, and of the Triangle and Scarab, engineering and architectural societies, respectively.

Who's Who in America, 1944-45

HODGSON, JOSEPH V(ERNON) Jan. 2, 1899- United States Government official and Army officer; lawyer

Address: b. c/o War Department, Washington, D.C.; h. 2041 Kakela Dr., Honolulu

Lieutenant Colonel Joseph V. Hodgson, prominent lawyer and former Attorney General of Hawaii, is United States commissioner on the United Nations War Crimes Commission. Hodgson was appointed American representative on the war crimes body on May 12, 1945, by President Truman '45, after having served as acting commissioner from the first of January. Replacing Herbert C. Pell, whom he served as deputy, Hodgson assumed his seat on the Commission at a time when the eyes of the world were focused on that body. With the Allied military victory in Europe complete, the problem of punishment of war criminals was foremost on the agenda of European reorganization. There had been considerable speculation about the policy and operation of the War Crimes Commission since its formation. However, Hodgson indicated his policy soon after his assignment. "Justice will be done expeditiously," said the new commissioner.

Joseph Vernon Hodgson was born in Boyne Falls, Michigan, on January 2, 1899, the son of Joseph V. and Ada Delphine (Adams) Hodgson. Educated in his home state, Hodgson attended the University of Michigan, where his studies were interrupted by America's entrance into the First World War. The young man served as a second lieutenant in the Infantry, a commission he held from September to December, 1918. Having earned his B.A. degree in 1921, he decided on a legal career and continued his training at the university's law school, obtaining his LL.B. in 1925. Admitted to the California bar that same year, Hodgson then sought and won admission to the bar of Hawaii the following year. During the next three years he was associated in law practice with E. C. Peters, who later became a Justice of the Supreme Court of Hawaii, and Ray J. O'Brien, who later became a judge of the Tax Appeal Court of the Islands. From 1929 to 1931 Hodgson continued his legal work with Peters, after which he engaged in private practice until 1934. Then the thirty-five-year-old lawyer assumed public office, becoming Deputy Attorney General of Hawaii. In 1937 Hodgson rose to the post of Assistant Attorney General, and the following year he became Attorney General.

An active member of the Hawaiian community, Hodgson belonged to several of the Islands' legal and civic agencies. He was acting member of the Board of Public Lands in 1935, and from 1938 until 1942 the lawyer was a member of the Farm Loan Board. During that same period he also belonged to the Board of Bar Examiners of Hawaii, the Procedural Rules Committee of the Supreme Court, and the Board of Health. From 1940 to 1942 he was a commissioner of the National Conference of Commissioners on Uniform State Laws. He was also a member of the Governor's Special Advisory Committee on the Hawaii Defense Act (1941-42).

On May 29, 1942, Hodgson entered the Army of the United States with the rank of major, becoming assistant to the judge advocate at Fort Shafter, Hawaii. In July of the fol-

HODGSON, JOSEPH V.—*Continued*

lowing year he returned to the continental United States to attend the Judge Advocate General's School at Ann Arbor, Michigan. After three months he was assigned to the War Plans Division of the Judge Advocate General's Office in Washington, D.C. On May 9, 1944, Hodgson attained the rank of lieutenant colonel and at about the same time left for London to work with the United States representative on the War Crimes Commission. In December he was relieved from assignment in the European theater of operations and reassigned to the Judge Advocate General's Office in the Capital.

January 1945 found Hodgson in London as deputy to Herbert C. Pell, then American representative on the War Crimes Commission. At that time Acting Secretary of State Joseph C. Grew '41 notified Pell that he would not be retained in his post on the Commission because of Congressional failure to appropriate the thirty thousand dollars for his salary and expenses. As reported in detail in *PM*, sharp controversy arose after Pell's dismissal, vigorous protests coming particularly from liberal quarters. Pell, former Minister to Portugal and to Hungary, had been a leading figure on the Commission, pressing for swift, decisive action against war criminals. Following his dismissal he expressed the opinion that he had been dropped because some State Department officials were opposed to his proposal to punish the Nazis for crimes against their own nationals, including the Jews. In April Pell placed part of the blame for German atrocities on Department officials who had taken no action on the recommendations of the War Crimes Commission. Had the Nazis known that their savagery would bring certain punishment, they might have been deterred from such acts, Pell claimed. After Pell's dismissal, Hodgson represented the United States as acting commissioner until his formal appointment to the post by the President in May.

Plans for the establishment by the United Nations of a commission for the investigation of war crimes had been announced in London and Washington in October 1942. A week later V. M. Molotov '40 had revealed that the Soviet Union planned to set up a similar body. Thus, at present, the War Crimes Commission, which does not include the Soviet Union, represents sixteen nations. The Russian War Crimes Commission and the Red Army have been carrying on independent investigations in their own area of operations. The creation of an international tribunal to include the Soviet Union has been proposed, however. In February 1945 the Crimea Declaration reaffirmed the determination of the Big Three to "bring all war criminals to justice and swift punishment." The existing War Crimes Commission has no powers of investigation, but is only an advisory body. It deals with reports of war crimes referred to it by the member governments and other bodies, and from this evidence decides whether or not a prima-facie case exists. The Commission then compiles lists of criminals which it sends to the military authorities so that steps can be taken for the apprehension of the accused.

Hodgson was present at the meeting of the Commission on January 31, 1945, when Lord Wright '45, representative of Australia, was elected chairman. (The new chairman replaced Sir Cecil Hurst, who resigned.) The Commission has figured prominently in the news since then, as a result of the final military collapse of Germany and the capture of leading enemy figures. On May 16 it was stated that the Commission had indicted Hermann Göring '41 as a war criminal the previous November. His case, said one spokesman, would be regarded as a test of the speed and procedure applicable to subsequent trials of war criminals. On May 17 it was revealed that the Commission had completed indictments against all leading Nazis. In addition, the war crimes body announced that it was prepared to deliver its evidence to Justice Robert H. Jackson '40, chief United States prosecutor. According to Hodgson, the prosecution waited only on agreement between the Western Allies and the Soviet Union on the matter of trial by military tribunal, as proposed by the United States. The Colonel's views were made clear in a statement released on June 1, in which he charged the Axis leaders with responsibility for the crimes committed during their regime.

Hodgson was also a member of the War Crimes Conference on problems of detection and prosecution of war criminals, which opened on May 31 in London. Its chief object was to coordinate the work between national offices and the Commission in preparation for the first war crime trials. The Colonel proposed that a central recording office for all war crimes should be set up as the only means of tracing the pattern of Axis crimes committed throughout Europe. "While the evidence in the possession of one national office might be insufficient to identify the persons responsible for a crime," he said, "all the evidence, when collected, might well identify all of the persons."

Throughout the world public clamor for quick action on the accused was followed by intensified activity on the part of the Commission. On May 18 the New York *Times* reported that the biggest manhunt in history was tracking down war criminals from Norway to the Bavarian Alps. The report added that the United Nations blacklist of major German criminals was practically complete. The War Crimes Commission has also in its possession lists of Japanese war criminals, the first of which was given to the group by the Australian Government in March 1945. In August The War Crimes Commission in London announced a pact establishing an International Military Tribunal to try the major European Axis criminals. The Tribunal was to consist of four members—one each from Britain, the United States, Russia, and France. The greatest international trial in history opened before the Tribunal at the Nuremberg court house on November 20.

Hodgson is a member of the Hawaii, California, and American bar associations and he has also served on the executive committee of the Hawaii chapter of the American Red Cross. A Mason and an Elk, he belongs to the Pacific Club, Oahu Country Club, and Outrigger Canoe Club in Honolulu. He belongs to the American Academy of Political and

Social Science, and he holds membership in Sigma Phi Epsilon and Phi Alpha Delta. Colonel Hodgson is unmarried.

HOLMES, JULIUS C(ECIL) Apr. 24, 1899- Aviation executive; former United States diplomat and Government official

Address: b. c/o Transcontinental and Western Air, Inc., Airlines Terminal Bldg., New York City

After more than two years of overseas wartime service, which included an important part in dangerous and delicate missions, Brigadier General Julius C. Holmes was appointed by President Roosevelt to the office of Assistant Secretary of State in charge of the division of administration and personnel of the United States Department of State, with its Foreign Service. Holmes filled that post from January into August of 1945, and with the end of the war he became vice-president of Transcontinental and Western Air, Inc., which is headed by Jack Frye '45.

Julius Cecil Holmes was born April 24, 1899, in Pleasanton, Kansas, to James Reuben and Lou Jane (Trussell) Holmes. He studied at the University of Kansas intermittently, with time out for service in the First World War (he enlisted in the Student Army Training Corps in October 1918). In December 1919 Holmes was appointed a second lieutenant in the Infantry in the Kansas National Guard unit. Advanced to first lieutenant in March 1920, he enrolled for the National Guard course at the Infantry School, Fort Benning, Georgia, completing the course in February 1921. That June he was commissioned a first lieutenant in the Infantry Reserve. In 1923 the twenty-four-year-old future general went into the insurance business. In June 1924 he was appointed a first lieutenant in the Cavalry Reserve, resigning this commission in March 1925 to join the Department of State.

A graduate of the Foreign Service School, in April of 1925 Julius Holmes entered the United States Foreign Service, becoming the vice-consul at Marseilles. After two years in that post he was sent to Turkey as assistant delegate of the High Commission, remaining at Smyrna as vice-consul. In 1929 he was made secretary of the Legation at Tirana, in Albania, and Chargé d'Affaires; after ten months Holmes was moved to the Legation at Bucharest as its secretary. Here he stayed for four years; in 1932, at the age of thirty-three, he was married to Henrietta Allen. They have three children, Henry Allen, Elsie Jane, and Richard Peyton, and make their home in Washington, D. C.

BRIG. GEN. JULIUS C. HOLMES

In 1934 Holmes was recalled to Washington to become assistant chief of the Division of Protocol and International Conferences. In 1935 he was sent down to Rio de Janeiro as secretary general of the Inter-American conference which succeeded in ending the bloody five-year war of Paraguay and Bolivia for possession of the Gran Chaco region; and the next year he was secretary of an arbitration commission. In October 1937 he resigned from the State Department to put his knowledge of protocol at the service of Grover Whalen's '44 New York World's Fair Corporation, where he was in charge of relations with all state and national governments. One of the most notable achievements of the Fair administration is that, after the outbreak of the Second World War in 1939, it persuaded all the warring nations (except Russia) to maintain their exhibits. About a month after the war had begun, Holmes was made vice-president of the Fair, and in January 1940 he went to Canada to negotiate for the appearance of the Dionne quintuplets. This offer was rejected by the Canadian Premier, Mitchell F. Hepburn '41—but not before it had secured some valuable publicity for the Fair.

After the closing of the Fair in 1940 Holmes accepted the post of president of General Mills do Brasil, General Mills South American subsidiary, which he filled from 1941 to 1942, at which time he was elected to the board of directors. In February 1942 the ex-diplomat, entered the Military Intelligence Service of the United States Army in which he had held a reserve commission as major since January 1936. Commissioned a lieutenant colonel (temporary) on February 1, 1942, he was ordered to "extended active duty" in the Office of the Combined Chiefs of Staff in Washington, D. C., as assistant secretary. In September 1942 Holmes was promoted to colonel (temporary) and sent overseas. There he had duty in the Office of the Assistant Chief of Staff for G-1 (personnel), serving in the Allied Force Headquarters in the European and North African theater of operations.

In October 1942 Holmes accompanied General Mark W. Clark '42 on a secret submarine trip from England to Algeria. There the party went ashore to meet by prearrangement with certain French officers, from whom they learned important facts about the disposition of the Vichy troops. Through an interpreter, Clark arranged with the Frenchmen for their surrender of the Algiers airfields as soon

HOLMES, JULIUS C.—*Continued*

as the Americans should arrive. Warned by some Arabs, the Vichy police raided the building, and the Clark party were forced to hide. When the police left, the party made their now famous escape.

The actual invasion landings, which Holmes had helped to plan, were made with relative ease, and "land resistance was not terrifically great anywhere," a fact which General Dwight Eisenhower '42 attributed to "this modern Message to Garcia." Of Clark, Holmes, and their companions, he said, "I am exceedingly proud of all of them. They took great risks and accomplished their work." Holmes was present at the conferences with Vichy French Admiral Darlan '41 which led to the surrender; in fact, he and Robert Murphy '43 drew up the actual Franco-American agreement. For this reason Holmes was said to be unpopular with liberals and New Dealers, who considered that policy too generous toward the enemies of democracy and too careless of its friends; and *PM* charged Holmes with "frequently voicing hostility toward the resistance movements organized inside Fascist territory," and with urging the State Department, in the summer of 1943, to "assure Italian workers that the Allies were not warring on Fascism—that our only enemy was Germany." To the first of these charges, Holmes answered that "his part was to carry out the instructions which General Eisenhower received from the Joint Chiefs of Staff," and that he had nothing to do with American policy toward General de Gaulle '40, leader of the Free French.

Colonel Holmes, named a brigadier general (temporary) by the President in June 1943, is generally credited with being the "father" of the Allied Military Government of Occupied Territory (formerly called AMGOT and later reduced to AMG). When the invasion of Sicily was mounted in North Africa, it was clear that some provision would have to be made for control of the civilian populations of what was then enemy territory. It was seen that civilian epidemics are no respecter of armies, that wandering refugees clutter the roads and impede military progress, and that disorder in general interferes with operations. Eisenhower's staff, of which Holmes was chief civil affairs officer from June 1943 to February 1944, devised a plan whereby British and American (and later French) civilian experts in the fields of government, law, finance, public health, and public safety should be put into uniform with appropriate ranks and given special training for administering occupied areas, once the conquering army moved on.

When an Allied army advanced AMG officers advanced with it. Their duty was to restore order and re-establish civilian life, usually in areas where the normal physical equipment has been badly damaged or perhaps completely destroyed. This task was, of course, made infinitely harder by the retreating armies' policy of destroying what they could and sabotaging the rest. There had been a constant stream of protest that AMG had put expedience above ideological considerations in getting the liberated areas back on their feet—had failed to root out the Fascists and collaborationists thoroughly, but had worked through and with the existent functionaries, except in the most flagrant cases. The military were, however, pleased with their freedom from the burden of civil administration, and AMG has been extended to all areas occupied by the Anglo-American forces. In Italy its later form is known as the Allied Control Commission; and in Europe, as Supreme Headquarters announced in May 1944, a Civil Affairs Section has been added to the four traditional "G's" of the General Staff. In charge of this G-5 was British Lieutenant General A. E. Grassett, who had Holmes as his deputy, and Brigadier General Frank McSherry as Chief of Operations. In contradistinction to AMG, G-5 was to "assist and advise" the various liberated governments in restoring civilian life, rather than to control them, and was to represent to the governments the views of the Allied military commander.

To Holmes, his staff, and his superior fell the complex and difficult task of restoring life in France, in Paris itself, in Belgium and Luxembourg and Holland, as the Allied armies fought their way into Germany. As these were all United Nations, the civil affairs administration was "designed purely to assist those countries." But the situation was changed when a part of Germany came under Allied occupation. In October 1944 General Holmes made public the code of military laws and ordinances which had already been put into operation in a small area of Germany and which would be applied to all further territory captured by Eisenhower's command. As the troops entered, German sovereignty was suspended and authority became vested in the Allied commander. The scope and complexity of the code was described as "without parallel in history." "Germany," remarked correspondent David Anderson, "will revert to her 1932 way of life, as it was before Adolf Hitler '42 attained power, if the scheme works out as planned. . . .The task of taking over a nation the size of Germany, lock, stock, and barrel, would be hard enough under the most favorable circumstances; with the country rebellious, bitter, and suffering from the shock of having familiar authority brushed aside, this undertaking will test the strength, patience, and ingenuity of the Allied command. It differs from Germany's [occupation] problem in 1940 in that no attempt will be made to employ quislings or foster the idea of normal life."

This code, which was to be enforced during "the rough-and-tumble period" before all hostilities ceased, and until the Allied powers including Russia devise a long-range program for Germany, was in effect the terms of unconditional surrender. Harsh but just—a trial according to accepted procedure was to be given each accused offender—these military laws were designed to eliminate Nazism; ensure the health and safety of the occupying forces; maintain public order; care for and repatriate recaptured Allied prisoners and other displaced persons; apprehend war criminals; protect Allied and United Nations property; control German Government property and public corporations; control foreign exchange assets; and to establish a suitable civil administration. Civilian activities were restricted; travel limited; discrimination based on race, religion, or political opinion forbidden; postal, telephone, and telegraph facilities closed; but the Germans, as those under Allied control had been astounded to discover, were allowed to keep their radios and listen to German broadcasts. Provision was made, also, for the punishment of war criminals, Nazi and Gestapo leaders.

On December 8, 1944, President Roosevelt '42 signed legislation creating two new assistant secretaries of state, in addition to the four already in existence, and then nominated General Holmes and James C. Dunn '43 for the posts. These appointments, considered jointly with those of Joseph C. Grew '41, William L. Clayton '44, Archibald MacLeish '40 and Nelson Rockefeller '41 (Dean Acheson '41 remained in the sixth assistant secretaryship), roused a storm of opposition in the Senate. Conservatives objected to MacLeish; many liberals joined with cotton Democrats to oppose Clayton; the name of Rockefeller was an anathema to some; while Dunn and Holmes drew the fire of liberals and New Dealers. "Every fairly progressive person who has had contact with Holmes in the European theater and in North Africa," wrote *PM*, "is appalled by his appointment," while the New York *Times*' Arthur Krock '43 described Holmes and Dunn as "very able career men [who] will fortify the Department."

The President stood firm behind his appointees, and the Senate finally held an unprecedented open hearing at which all the nominees were questioned. General Holmes flew in from Europe for the hearing the night before, was questioned for fifteen minutes, and then flew back to Allied Field Headquarters in Paris. All the nominations eventually went through, although with much criticism from Senators. And on December 29 the new Assistant Secretary of State in charge of administration and personnel of the Department and the Foreign Service received the Distinguished Service Medal for his exceptionally meritorious services as chief of the military government section at Supreme Headquarters the preceding year.

The duties of Holmes in his new State Department post included "budget and finance problems, personnel, communications, procurement of supplies, records and files, space problems, the coordination and review of correspondence . . . and the passport and visa division." (According to the *American Political Science Review* [April 1945], the two major organizational orders of January 12 and December 29, 1944, had provided the State Department "with a sound administrative pattern for conducting our foreign relations.")

The war over, Holmes resigned from Government service on August 17, stating that he had accepted his appointment by Roosevelt only as a war assignment and that he wished to return to private business. His vice-presidency of Transcontinental and Western Air dates from late 1945, in which capacity he takes an active part in the international relations of the airline's routes to Europe, North Africa, the Middle East, and Asia.

Julius C. Holmes was made an Officer of the Legion of Merit, and has been decorated with nine foreign orders: Commander of the Crown of Yugoslavia, Commander of the Greek Order of the Phoenix, Officer of the Southern Cross of Brazil, Chevalier of the French Legion of Honor, Commander of the Crown of Rumania, Commander of Oussam Alaouite (Morocco), Grand Officer of Nishan Iffticar (Tunisia), Companion of the Bath, and member of the Lebanese Order of Merit. The sandy-haired, mustached executive is a Fellow of the American Geographic Institute, and a member of the American Foreign Service Association and the Academy of Political Science.

HORROCKS, B(RIAN) G(WYNNE)
Sept. 7, 1895- British Army officer
Address: b. c/o War Office, London

Lieutenant General B. G. Horrocks of the Twenty-first Army Group was regarded by many analysts, according to *Newsweek*, as probably the best corps commander in the British Army in the Second World War. Although, according to the magazine, Horrocks "won more victories for the Army than any other general," he was virtually unknown to the public until he was revealed as the commander who had led, in September 1944, the thrust of British ground forces toward Arnhem, the Netherlands, in support of General R. E. Urquhart's '44 First Air-borne Division. This had followed Horrocks' six-day march from the Seine to Antwerp and Brussels.

Brian Gwynne Horrocks was born September 7, 1895, the only son of Minna (Moore) Horrocks and William Heaton Horrocks, later a Royal Army medical officer and King's Honorary Surgeon. The Army career of Sir William's son started in 1914 when the nineteen-year-old soldier was sent to France as a second lieutenant with the Middlesex Regiment. Two months later, wounded and captured by the Germans, his grit showed itself through his repeated efforts to burrow his way under the prison walls, and won for him the nickname "Dog" from his fellow inmates. Finally escaping near the end of the war, Horrocks was awarded the Military Cross for his "perseverance and determination." In 1917 he was raised to captain, and, in February 1919, posted to Russia, where he remained until that fall. It was his last post abroad before the Second World War. In the Regular Army Horrocks served as an adjutant with the Territorial

LT. GEN. B. G. HORROCKS

Army, 1927-30; as a staff captain at the War Office, 1934-36; and as a brigade major, Aldershot Command, under General Sir Archibald Wavell '41, 1936-37. Having in the meantime also passed through the Staff College, he was made an instructor at Camberley in 1938. (His father had been an assistant professor at the Army Medical School at Netley before the First World War.)

The start of the Second World War found Major Horrocks still at Camberley. Made a lieutenant colonel that first October of the war, he was kept on at the college to train others until the following May, when he was given command of a battalion of his old regiment, the Middlesex. The succeeding steps from lieutenant colonel to lieutenant general were made in less than a year: A little more than a month after taking over the battalion he was made a brigadier and appointed to command an infantry brigade. In February 1941 he went to the Eastern Command as a brigadier on the General Staff, and four months later was made a major general. After a year spent in training a division in England, Horrocks was sent overseas as head of the Home Counties, Forty-fourth Division, which later won glory in the defense of Egypt and the victory of El Alamein. Another advancement made him lieutenant general (acting) and head of the Tenth Corps. Later he was transferred to the Thirteenth Corps of the Eighth Army, a corps made up of seven infantry brigades, two armored brigades, and a French flying column.

The British war correspondent, William Stapley, wrote in 1943 that Horrocks went secretly to Egypt in August 1942 at the special request of the British Eighth Army's commander, Field Marshal Sir Bernard Montgomery '42. "He was one of the key pieces on the Egyptian chessboard," reported Stapley; "a vital leader destined to pit his wits and tank-fighting genius against Rommel '42. He was a man of whom the German General Staff had no knowledge whatever."

During the battle of El Alamein in October 1942 the Thirteenth Corps made holding attacks in the south until Alexander '42 and Montgomery had forced a break-through in the north; then it moved up toward the coast and joined in the pursuit of Field Marshal Erwin Rommel and his Afrika Korps through Tobruk, Benghazi, El Agheila, and Tripoli to Tunis. For his services in Africa, Horrocks was recommended for the D.S.O. and the C.B. by Montgomery, who said that Horrock's handling of the Thirteenth Corps had contributed in a marked degree to the general success of the campaign. At Tunis the General had been seriously wounded in a forward area. Explaining his presence in the front line, he said: "Battles today are fought at thirty-five or forty miles an hour. Heading a division means you have got to be right up with your men. And it's a good thing." For a time it was feared that he would never be able to fight again, but, recovering gradually, he soon was spoiling for action, and when a corps commander had to be relieved in Normandy in 1944 Montgomery sent for Horrocks.

Soon after Horrocks took hold in Normandy the tempo of the campaign, according to *Newsweek*, was stepped up. In the last week of August British Army units were reported to have crossed the Seine, and by September 3 Horrocks' forces had completed the "mad dash" from the river through Amiens to take Brussels and Antwerp, a distance of over two hundred miles covered in less than a week. Horrocks, moreover, had had the satisfaction of driving forward over the same territory he had traveled in 1940 as commanding officer of a machine-gun battalion fighting part of the rear-guard action that had ended at Dunkerque.

From Antwerp Horrocks had then thrust on toward Nijmegen (the Netherlands) on the Waal River, in support of air-borne troops who had already been dropped at Arnhem ten miles beyond. Although Arnhem was lost to the Germans, the British were able to hold the Nijmegen bridge, "one of the biggest prizes in Holland." The failure to hold Arnhem, moreover, was not considered to be the fault of Horrocks' ground support, but was attributed to causes out of the General's control. As summed up by a New York *Herald Tribune* correspondent, these causes were: delays, forced by bad weather, in providing air-borne reinforcements and supplies for the air-borne division; interference with the overland flow of supplies—the Germans, considering the campaign a major attack against the Reich, had defended the sector with the best troops available.

Horrocks exposed himself to shellfire as readily as any soldier ordered to push forward. Almost completely cut off from his own tactical headquarters once during the Nijmegen battle, after he had been summoned back to Headquarters for a conference, the General had jumped into a Bren-gun carrier, and, with a small platoon as a bodyguard, had slipped through Nazi positions in the early dawn.

Field Marshal Montgomery gave Horrocks almost carte blanche in planning battles, and he generally had his pick of divisions for specific attacks. He disliked paper work and as an alternative, used some of the best staff officers in the British Army as aides. His decisions were quick and final. A hard taskmaster, he still had a smile or friendly word for everyone, and his men were said to be devoted to him. His battle garb combined comfort with utility: brown corduroy trousers, a thick woolen battle-dress jacket, and a peaked service cap. He never wore a helmet even when under heavy shellfire. Six feet tall, he is "slim and fit." His graying hair is "gently wavy," and "blue eyes peer around his thin hawklike nose." He speaks clearly and precisely and liked to carry on conversations in mid-battle. "If I'm too busy to talk to you," he said, "I'm not doing my job right."

HOWARD, MRS. HENRY *See* Howard, A.S.

HOWE, C(LARENCE) D(ECATUR) Jan. 15, 1886- Canadian Government official; engineer

Address: b. 375 Wellington Rd., Ottawa; h. 7 Crescent Rd., Rockcliffe Park, Ottawa

Holding one of the key posts in the Canadian peacetime Cabinet is C. D. Howe, Canada's Minister of Reconstruction, who, as Minister of Munitions and Supply, built up Canada's negligible industry into a major factor in the successful prosecution of the Allied war against Germany and Japan. Called by American reporter Arthur Bartlett "the living symbol of our national cousinship to Canada," and by reporter Austin Cross "an assembly line in pants," Howe is said to wield greater influence over the lives of Canadians than anyone except Prime Minister Mackenzie King '40.

Clarence Decatur Howe was born in the United States, in Waltham, Massachusetts, in 1886, the son of William Clarence and Mary (Hastings) Howe. He was educated in American public schools, and in 1907 he received his Bachelor of Science degree from Massachusetts Institute of Technology. After graduation, although only in his twenty-second year, he became a member of the staff of M. I. T. In 1908 he was offered a post as professor of civil engineering at Dalhousie University, in Halifax, Nova Scotia. After teaching at Dalhousie for five years, he accepted a position with the Canadian Board of Grain Commissioners as chief engineer, at Fort William, Ontario (1913-16).

Howe in 1916 organized his own firm of consulting engineers, which designed and supervised construction of grain elevators, pulp mills, coal docks, and other heavy engineering structures. In a short time he became "the best-known builder of grain elevators in the world," and the volume of his business in Canada and abroad swelled to the sum of one hundred million dollars. Between 1932 and 1934 he was also appointed by the Argentine Government as a special consultant on problems relating to the transportation and storage of grain.

National Film Bd.

C. D. HOWE

In 1935 the engineer, who had been a Canadian citizen for some time, ran for Parliament. Elected to the House of Commons, he was at once appointed by Prime Minister Mackenzie King to the Cabinet as Minister of Railways and Canals, and later as Minister of Marine. Before the year was out Howe had streamlined and consolidated the two ministries and he became Canada's first Minister of Transport. Said New York *Herald Tribune* interviewer Arthur Bartlett: "Fearless, even ruthless, in accomplishing his objectives, he had chopped heads off first and apologized afterwards. 'There is nothing personal in this,' he had assured one big officeholder whose resignation was required. 'It is just one of the wretched things a man has to do when he takes on a responsibility such as I have.' " As Minister of Transport, Howe supervised the wide network of Government-owned Canadian National Railways, reorganizing its administration, established the National Harbor Board, and founded the Canadian Broadcasting Corporation. In 1938 he opened for service Trans-Canada Airlines, Canada's first transcontinental passenger airline. It was his favorite project as Minister of Transport, reports Bartlett, and in order to organize its operating and ground services, "he flew all over the United States getting ideas and data; then went home and pushed the building of a string of airports and emergency landing fields across the continent."

In June 1939 Canada, anticipating war, set up its Defense Purchasing Board. When this bureau was replaced by the War Supply Board after the declaration of hostilities, C. D. Howe became its head. Then, in April 1940, Howe was appointed Minister of Munitions and Supply, or chief of the new department which superseded the War Supply Board. This was a job which called for the fullest abilities of the engineer, for Canada was not organized industrially for mass production of war supplies. During the First World War Canada's production had been limited largely to shells, and when the Second World War began in 1939 she had only one small munitions plant in operation, and had not launched a single seagoing merchant ship in twenty years. Two reasons for this retarded war production have been given by *Business Week*'s Ottawa Bureau: "Previous efforts to speed up industrial cooperation had been blocked from overseas, (1) through British industry's reluctance to furnish the standard specifications for the war equipment desired, and (2) through delays by the British Government in placing orders."

But when France fell in June 1940 England realized that for her own security Canada must be given the signal to produce for war. Receiving the "go ahead" signal in production that year, Canada, under Howe's leadership, threw into the struggle every economic resource that she possessed. Response to Howe's urging for constant day-and-night production was immediate, with strikers even canceling their walkouts to answer the call. Howe personally went to England determined to bring back the blueprints and specifications which Canadian industry required, and returned to Canada in February 1941 convinced that industry must speed up its operations still more. (On this trip he almost lost his life when the *Western Prince* was torpedoed and he spent twelve hours in a lifeboat.)

When there were complaints throughout Canada about Government delays, insufficient funds, and hampered production, especially in the airplane industry, Howe pointed out that Canada before 1940 had had no aircraft plants and that everything had had to be improvised. Production on the whole, he said, was up to schedule, although the maintenance of new contract obligations depended upon the amount of machine tools which could be obtained for the manufacture of guns, aircraft, tanks, and ships. And for these tools Canada depended to a large degree on cash, not Lend-Lease, purchases from the United States. With the cooperation of the Canadian Manufacturers Association and the Canadian Chamber of Commerce Howe then organized a census of available Canadian plant facilities and equipment and on the basis of the information obtained distributed production equally throughout the Dominion.

By 1941, according to Lord Beaverbrook '40, Canada was producing more per unit of production than any other country in the world. Moreover, she was sending these arms and munitions to Great Britain and the Dominions, to the United States and China, and was preparing to fill orders for the Soviet Union. (The next year Canada became a member of the Combined Production and Resources Board, which hitherto had consisted only of representatives of Great Britain and the United States, and Howe was appointed Canada's representative.) Two years later the shipyards and factories reached an all-time peak in production. Some months before total victory in 1945 Howe summed up Canada's contribution to the war effort: "Generally speaking, the Canadian war output has been outstripped by that of the United Kingdom, the United States, and Soviet Russia. But in timeliness, variety, newness, and quality it has constituted a major factor in the Allied swing from desperate defense to victorious attack. Indeed, it is possible that without it in the earlier days of the war the United Nations might have been defeated."

Canada's part in the production of the atomic bomb was also under the supervision of C. D. Howe. In the early days of the war mines producing uranium were taken over by the Government, with extracting plants, in order to preserve this important material for the United Nations. Canada, according to a release of the Canadian Wartime Information Board, entered the field of uranium research at the suggestion of Great Britain, with whom she established a joint laboratory in Montreal. Canada played a very significant, if not a major role: she produced not the complete bomb, which was done only in the United States, but essential components of it. Canadian plants have also been producing plutonium, the newly evolved "fissil" substance derived from uranium and "heavy water." For the future the Dominion Government has proposed an extensive plan for exploration in the Northwest Territories to extend the known fields of uranium-bearing ore beyond those first discovered in Canada on the east side of Great Bear Lake in 1933.

In October 1944 Howe had been given the additional portfolio of Minister of Reconstruction. In March 1945, with a general election scheduled for the near future, Reconstruction Minister Howe presented the program for the postwar era on which the Liberal Party was returned to power on June 11, 1945. Placing emphasis on a free enterprise system, he recognized as the foremost of Canada's needs the necessity of providing jobs for the two million men then in the country's service or employed in war industry. To implement his program he planned to eliminate or at least to reduce wartime taxes as soon as feasible, to encourage private investment with low interest rates and loans from Government lending bureaus, to enlarge the export market and to expand the domestic market by finding private buyers to replace the Government in the purchase of more than half of Canada's production. He promised that there would be no large expenditure for public works and that emergency anti-inflation controls would be retained only for "a smoother, more rapid transition to a prosperous peacetime economy." A social welfare program was also on his agenda.

In late 1945, with reconversion getting under way, Howe was attempting to cope with a labor problem which threatened to bring about extensive unemployment in some areas while labor was needed in others. Labor, said Howe, is reluctant to go back to former jobs after being employed in war work; no one wants to perform the disagreeable tasks or to accept a reduced pay envelope. Critics of the Government, however, viewed the situation as an outgrowth of wartime labor policies, which, they said, favored the employers through "no strike" laws and the recognition of plant or unaffiliated unions. According to G. M. A. Grube, writing in the *Canadian Forum* in March 1941, labor even during the war was treated "as a potential enemy to be appeased instead of as a friend whose eager and invaluable cooperation could so easily have been enlisted." The Government, said Grube, put employers with violent hostility toward trade unions into positions of high responsibility. "Canadian labor," he continued, "needs a Wagner Act."

The Canadian has had honorary degrees conferred upon him, including one by Harvard University in June 1945. He is a member of the American Society of Civil Engineers and of Mechanical Engineers. Howe was married in September 1916 to Alice Martha Worcester. Their five children are William Hastings, Elisabeth, John Worcester, Barbara, and Mary Jeannette.

IRONSIDE, HENRY ALLAN Oct. 14, 1876- Clergyman

Address: b. Moody Memorial Church, 1609 N. LaSalle St., Chicago; h. Plaza Hotel, Chicago

"Archbishop of Fundamentalism" is the apt title once bestowed by a writer on Henry Allan Ironside, pastor of the Moody Memorial Church in Chicago. One of the best-known conservative expositors of the Bible in the United States, he has never been ordained and he belongs to no denomination. Yet, it is said, he has spoken from more pulpits than almost any other man in the United States. With more than fifty years spent as a home missionary, itinerant evangelist, Bible teacher, and pastor, Ironside has gained a place of great influence in Fundamentalist ranks.

Henry ("Harry") Allan Ironside was born in Toronto, Canada, October 14, 1876, of devout parents, John Williams and Sophia (Stafford) Ironside. Before young Harry was two years old his father, known throughout Toronto as the "Eternity Man," had died. His widow was forced to work hard to support herself and her two children, and in 1886, when Harry was ten years old, the family moved to the United States, settling in Los Angeles. There the home became a sort of haven for itinerant preachers and evangelists. By the time Harry was twelve he had read through the Bible ten times and was conducting his own Sunday school. Two years later the realization came to him that he must dedicate himself to evangelical Christianity. As he tells the story, he was attending a party one evening when, as he stood off by himself, he suddenly received the spiritual impact of certain verses from the Proverbs, those beginning, "Because I have called, and ye refused; I have stretched out my hand, and no man regarded." (Proverbs, Chap.1:24-32)

Thus, after he had finished grammar school, the young convert had no desire to continue with his secular education. In his newly found zeal he joined the Salvation Army and soon was an officer. At the age of twenty-one he held the rank of captain, with the responsibility for a large corps territory in California. As a Salvationist, Ironside was a fervent street preacher, although he soon found himself unsure about his own spiritual qualifications for the evangelical calling. After much self-debate, he finally left the Salvation Army and joined a group commonly known as the Plymouth Brethren. The members of this section acknowledge only the title "Christians" or "Brethren." "They take the Scriptures as their sole guide, protest against sectarianism, and reject all ecclesiastical organization, creeds, rituals, and ordained ministry. They are Calvinistic . . . have no church buildings, and emphasize premillennialism," or the doctrine that the second coming of Christ ushers in the millennium.

Without definite means of livelihood, young Ironside continued to preach on street corners, in rescue missions, and in frontier towns. After about a year, in January 1898, he was married

HENRY ALLAN IRONSIDE

to Helen G. Schofield, the daughter of a Presbyterian minister. Ironside tells many stories of this period of his life. Once, he says, while preaching on a San Francisco street, he was challenged by an atheist to a debate on the subject of Christianity versus atheism. Before a crowd of several hundred people he accepted this challenge, adding, however, one condition—that the man present at least two bona fide witnesses who had benefited spiritually by following his belief; Ironside, on the other hand, would provide one hundred people who had been saved by the teachings of Christ. The atheist, says the preacher, refused these terms and walked away.

Mrs. Ironside accompanied her husband on his travels until Edmund, the first of their two sons, was born (their second son is John); then they established their home in Oakland, California. Ironside continued with his itinerant preaching, however. With the gradual recognition of the power of his preaching, his following spread until he was traveling continually from coast to coast conducting Bible conferences and evangelistic services in churches and other meeting places. As the years passed, his sermons reflected his gradual shift to a position of moderate Calvinism.

Early realizing his lack of formal education, Ironside had set about to educate himself. He studied Greek and Chinese. He became a voracious reader, often going through two or three doctrinal works in one day, until he is now a recognized authority in many fields of religion. His good memory has assisted him in remembering long poems and selections of the Scriptures, and it is possible for him to deliver a sermon without the aid of written notes. In 1900 he wrote his first book, entitled *Notes on Jeremiah,* and since then he has written many books and pamphlets on the Bible, some expository and others devotional volumes. The Western Book and Tract Company, a nonprofit distributing organization for Christian literature, of which Ironside is president, was founded by him in California in 1912. Today it distributes about seventy-five thousand dollars' worth of literature a year.

In 1930 the Moody Memorial Church, founded in Chicago by Dwight L. Moody in 1864, extended a call to Harry Ironside. He had never held a pastorate before, and now he was being offered the most influential Fundamentalist pulpit in the United States. After ten months of deliberation he finally accepted, although it meant breaking with a principle of the Brethren, who reject ecclesiastical organization. He became the tenth pastor of the historic Moody Church.

Fundamentalism is a twentieth century movement in Protestantism. It "re-emphasizes as fundamental to Christianity the inerrancy of the Scriptures, Biblical miracles, especially the virgin birth and physical resurrection of Christ, and substitutional atonement," which is the belief that "Christ took on himself the punishment due to sin, and by his sacrifice offered adequate satisfaction to the offended infinite majesty of God." In the church services the pastor seeks to secure conversions among the congregation, which involve "repentance, or turning from sin to God, and Christian faith, or turning to God . . . with a view to being turned more effectively from sin." In the psychology of religion conversion is a highly emotional experience, being "an abrupt rapid change to an enthusiastic religious attitude."

Ironside draws large audiences, and his simple, unspectacular method of preaching is said to win converts nearly every Sunday. His sermons are usually expository, but are sprinkled with humor. When he assumed the pastorate of the Moody Church, there remained a building debt of three hundred and nineteen thousand dollars on the structure, which had been built in 1925 at a cost of a million dollars. Under Ironside's leadership, the four thousand members had liquidated the debt by the end of 1943.

Ironside's sermons are broadcast on Sunday mornings from Moody Church, and electrically transcribed. In addition to his books—one of which, entitled *Except Ye Repent,* won the American Tract Society's one-thousand-dollar prize in 1936—Ironside writes a weekly commentary on the International lesson for the *Sunday School Times,* a magazine of evangelical Christianity. Nearly all his sermons and talks have appeared in print, so that many people know him as an author if not as a preacher. In conformity with an agreement whereby Ironside is at liberty to preach at other meetings during the week, he participates in as many as forty Bible conferences during a year, besides filling other preaching engagements. However, since these do not necessitate his traveling more than a thousand miles from Chicago, he is always in the Moody Church pulpit on Sunday morning.

Ironside has received two honorary degrees: a D.Litt. in 1930 from Wheaton College in Illinois, and a D.D. in 1942 from Bob Jones College in Florida. From 1925 to 1943 he was a visiting professor of Biblical literature at the Evangelical Theological Seminary in Dallas, Texas. He is also chairman of the board of directors of the Southern Bible Training School in Dallas, a school which prepares Negroes for the ministry. In 1942 he was elected president of the Africa Inland Mission.

During one of his several trips abroad, in 1936, he spoke from the pulpit of the St. Giles Cathedral in Edinburgh, the church of John Knox. In his free time, aside from collecting stamps (he has between twenty-five and thirty thousand), he finds relaxation, he says, in studying the Chinese language.

Bald and stout, Ironside is of medium height. He dresses conservatively, and is modest and friendly in manner. He declares he is uncomfortable in the presence of doctors of philosophy, and completely out of place in college academic processions. Like Dwight Moody, the noted American evangelist, Ironside is always happier when the "Reverend" is omitted in addressing him. His friends say that on special occasions he can be lured into singing, with appropriate gestures, the old Salvation Army songs of his youth, which, when contrasted with modern hymnody, he can make seem irresistibly funny.

ISAACS, GEORGE (ALFRED) 1883-
British Government official; labor leader
Address: b. Ministry of Labor, London; h. 13/16 Borough Rd., London

The British Labor Party, which in July 1945 formed its first Government in fourteen years, is made up basically of two elements. On the one hand it is a national party—pledged to the achievement of a basic standard of living—to which a number of peers and many middle-class persons belong as individuals, by conviction; this group is represented in the third Labor Government by such Ministers as Sir Stafford Cripps '40, Hugh Dalton '45, and Prime Minister Clement Attlee '40. On the other hand, the Labor Party is also an organ of the trade unions, and many of its M.P.'s arrived in Parliament through their activity in union affairs. The Right Honorable George Isaacs, Minister of Labor and National Service in the Attlee Government, is perhaps typical of this second group. "A powerful and popular labor leader," he holds one of the most difficult and responsible portfolios in the reconversion Ministry.

George Alfred Isaacs was born in London in 1883, the eldest of nine children. His father was a newspaper printer. At eleven, the future Minister was selling tea from door to door in Hoxton; at twelve, he got a job in a newspaper plant as office assistant. Later he was to work his way up through the various departments of the machine room. When married at the age of twenty-two, says Delos Lovelace of the New York *Sun*, Isaacs was earning two pounds two shillings (about ten dollars) a week as printer's assistant.

Isaacs was prominent in trade union activities, and became secretary of the National Society of Operative Printers and Assistants and editor of their *Natsopa Journal*. He was elected president, too, of the Printing and Kindred Trades Federation. In 1918, the year the Labor Party ceased to be an exclusively socialist-unionist movement and became a regular national political party, he contested for Parliament from North Southwark; and in 1919 the thirty-six-year-old printer became Mayor of Southwark for a two-year term. He was a candidate in the Gravesend Division of Kent in 1922, and was elected to Parliament as a Laborite, serving in 1923-24. In the first Labor Government in 1924 Isaacs served as Parliamentary private secretary to J. H. Thomas, Secretary of State for the Colonies.

British Official Photo.

GEORGE ISAACS

After five years' absence from the House of Commons, the unionist won election from the North Southwark constituency of London in 1929. When the second Labor Government was formed that same year, Isaacs again became Parliamentary private secretary to Thomas, then Lord Privy Seal. Like most Labor M.P.'s, Isaacs lost his seat in the general election of 1931 which followed Prime Minister Ramsay MacDonald's sudden defection from the Labor Party, and was not returned to Parliament until 1939. The next spring the Neville Chamberlain Government was forced to resign. When the Labor Party agreed to form a coalition wartime Government under Winston Churchill '42, Opposition Leader Attlee became Lord Privy Seal. In 1942 George Isaacs became Parliamentary secretary to the First Lord of the Admiralty, A. V. Alexander '40. (Isaacs has served on the Government's departmental committee on coroners and the departmental committee on workmen's compensations.)

Isaacs was a member of the Industrial Mission sent to the United States in September 1941. Apart from that, his most newsworthy appointment was 1944 chairman of the British Trades Union Congress, to whose Executive he had been elected ten years earlier. (Isaacs never actually became chairman for he soon attained ministerial rank.) Then came the general election of July 1945, which gave Labor an overwhelming majority in Commons. Prime Minister Attlee chose George Isaacs for the important Ministry of Labor and National Service, which was faced with the task of keeping the war industries and essential civilian production manned for the duration of the Second World War. He succeeded Bevin '40. Hardly had the new Ministers had time to get used

ISAACS, GEORGE—*Continued*

to their offices when the Japanese surrender hurled them into the equally formidable adjustments of the sudden peace. The "monumental task of demobilizing the armed forces and reallocating the nation's manpower for peacetime purposes" was before the sixty-two-year-old Labor Minister.

The end of the war found Britain in an unfortunate economic position. Deeply in debt to the nations which had furnished supplies during the war, she lacked the means to repay them after six years of a war economy, and yet she had to import food. Isaacs, who was in charge of the release of armed force personnel, told the House of Commons, "In this period of rapid readjustment, the orderly redistribution of workers is of greatest importance if the most urgent needs of the nation are to be satisfied first—if homes are to be built and furnished, household goods replenished, and exports raised in order to pay for raw materials and food." Outlining the Government's proposed scheme of controls, even more stringent than in wartime, Isaacs announced that, under Class B of the demobilization program (Class A was unconditional release), service personnel would be released if they went directly into certain industries where workers were needed. These included building textile mills, clothing and footwear factories, and laundries. As for releasing workers no longer needed for munitions making, he said, "where there is a choice, cuts in production will ordinarily be made first in those areas where the demands for labor for civilian production and services are most urgent." A difficulty was that those industries most in need of workers, such as textiles and mining, were the very ones to which workers were reluctant to return, because of lower pay, undesirable working conditions, and—especially in the Welsh mines—a long history of grievances. The Government hoped, however, that when the mines were nationalized the miners would be willing to return as public employees.

The British Government's long-awaited plan for a speed-up of demobilization was announced by Isaacs in early October 1945. The over-all plan called for the release of 1,500,000 men and women by the end of 1945 and another 1,500,000 by June 1946. During the longshoreman's strike in the same month the Labor Minister declared that, whatever the men's grievances were, they could not justify the strike because the regular machinery of governmental conciliation had not been consulted. As the strike continued, the Government refused to intervene because Isaacs said, it was the Government's policy to do nothing that would injure the constitutional machinery of collective bargaining. The strike ended early in November.

"Spectacled and serious" George Isaacs refrains from talking shop, to such an extent, it is reported, that his wife Flora did not know of his elevation to the Ministry until she read of it in a newspaper. The Isaacs, who have one married daughter and one adopted son (Mrs. Isaacs' nephew), live in Berryvil, an eight-room house in East Molesey, Surrey; the Minister's wife does the housework, with the assistance of a charwoman three times a week. Isaacs is a justice of the peace in Surrey County, chairman of the Kingston County Bench, and a Liveryman of the Worshipful Company of Stationers, a medieval guild, now mainly charitable. (The Liverymen elect the Lord Mayor of London and certain other officials.) He is also an alderman of the London Borough of Southwark. He has written one book, *The Story of the Newspaper Printing Press,* published by his union in 1931. For recreation Isaacs likes gardening and reading, especially tales of the Wild West; he likes to swim, when he gets the chance, and goes to the cinema once every month or so.

IZAC, ED(OUARD) V(ICTOR MICHEL) (ē'zäk) Dec. 18, 1891- United States Representative from California

Address: b. House Office Bldg., Washington, D.C.; h. 5380 Cajon Blvd., San Diego, Calif.

Ed V. Izac, Democratic Representative from the Twenty-third Congressional District of California, in 1945 was in his fifth consecutive term in the House of Representatives. He is a member of the House Naval Affairs Committee and was one of the six Congressmen appointed, pursuant to General Eisenhower's request, to inspect the German concentration camps. A German prisoner of war during the First World War, he returned from the inspection tour firmly convinced that a harsh peace should be dealt the German people.

Edouard Victor Michel Izac was born on December 18, 1891, in Cresco, Iowa. He was one of the nine children of B. Michel Izac, who came to the United States from Alsace-Lorraine, and Mathilde (Geuth) Izac, a native of Philadelphia. He attended Iowa and Minnesota schools for his early education, going from high school in South St. Paul, Minnesota, to the United States Naval Academy in 1911. He received his Bachelor of Science degree from Annapolis in June 1915 and soon after commencement he was married to Agnes Cabell, daughter of General De Rosey Carroll Cabell of the United States Army. (The Izacs have six children—Cabell [Mrs. Robert Waller], Edouard Victor Michel, Jr., De Rosey Charles, Suzanne, Forrest René, and André.)

For nearly two years, until the United States entered the First World War, young Izac served on various men-of-war successively as an ensign, lieutenant (junior grade), and senior lieutenant. He was on duty in the battleship

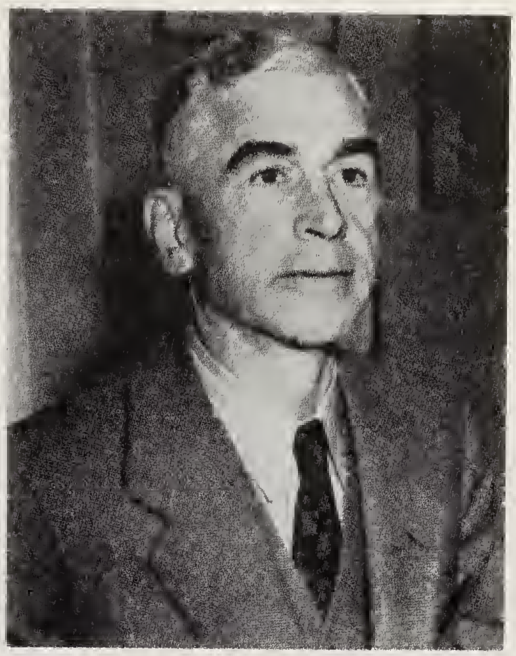
Florida in 1917 when it trained the first gun crews for the merchant marine. By the time the United States was in the war, he had been transferred to the Transport Force. He was serving as first lieutenant aboard the transport *President Lincoln* when it was torpedoed in mid-Atlantic in May 1918. The young officer was captured by the German U-boat on which he took notes on submarine operations for the rest of the cruise, and planned to escape as soon as an opportunity presented itself. En route to Villingen, Baden, in a rapidly moving prison train, he jumped out of a window. He was recaptured and forced by his German captors to walk to camp at the point of a bayonet, although he had injured his head, knees, and feet in the leap from the train. Later he succeeded in escaping from the camp and, after swimming the Rhine, he passed through Switzerland and finally reached the Allied lines.

When the war was over Izac appeared before a claims commission to accuse the Germans of deliberate brutality. As witnesses he had American Army doctors who had been imprisoned with him and who testified that he was treated for one hundred injuries. As further evidence he produced a court-martial record of a German soldier convicted of destroying German Government property—the soldier had broken his rifle stock on Izac's head after recapture. Izac received $20,000 in damages, and the incident was cited as an example of one way of repaying American airmen who suffered cruelties at the hands of the Japanese during the Second World War. Isac published an interesting account of his experience in a book entitled *Prisoner of the U-90*.

In 1919 Isac became director of munitions at the Washington (D.C.) Navy Yard. He was then promoted to lieutenant commander, but he was forced to retire two years later because of his wounds. From 1921 until he entered politics thirteen years later Izac was engaged in newspaper work and free-lance writing. His articles covered a wide variety of subjects—history, the Nicaraguan Canal, his war experiences, veterans' problems, and English. In 1934 he was nominated by the Democratic and Progressive parties as Representative from the Twentieth Congressional District in California. He was defeated that year, but elected in 1936 to the Seventy-fifth Congress. He has been re-elected for each succeeding term, and in the Seventy-ninth Congress represents the Twenty-third District.

An Administration supporter, the Congressman voted for New Deal legislation and Roosevelt '42 win-the-war measures. His progressive record includes votes for appropriations for the United Nations Relief and Rehabilitation Administration, the anti-poll tax bill, and under the Truman '45 Administration, for extending price control for another year. Izac has opposed the anti-strike bill, the anti-subsidy bill, and also voted against permanent status for the House Committee on Un-American Activities (Dies '40 Committee).

Izac is a member of the Naval Affairs Committee of the House of Representatives. In January 1942 he signed the minority report of his committee's investigation of the ship-building industry. The report stated that "until there is conclusive evidence of either or both [capital and labor] having failed to keep faith with the Government and the people in this respect [settling differences by mediation and arbitration], we are of the opinion that Congressional committees should refrain from criticism of either or both." The opposing majority report stated that strikes were the "greatest single cause of delay in the defense program." In December 1943 Izac headed the Naval Affairs subcommittee investigating the congested areas on the West Coast, in San Diego, Los Angeles, San Francisco, California; Portland, Oregon; Seattle, Washington. The subcommittee's reports pointed out that the overcrowding was the result of the sudden rise in production without sufficient warning being given to the local authorities. The subcommittee found that racial minorities, particularly the Negroes, had the most serious housing and recreation problems. It was recommended that these areas be represented on the President's Committee for Congested Areas, and remedies were suggested for the food, transportation, child-care, and police problems. A month later, in January 1944, Izac headed the subcommittee on the transportation situation in the United States. His report charged the transportation industry and the War Production Board with causing the national crisis by their negative attitude. The committee felt that the WPB had neglected maintenance problems in its overemphasis on the manufacture of planes, tanks, ships, and armament. The committee held: "Certainly the transportation system of this country is so vitally an integral part of our war machine that its proper maintenance contributes more to the final victory than will a few planes or tanks."



ED V. IZAC

In February 1944 Izac supported President Roosevelt's '42 veto of an income tax bill. It was the first time an important tax bill had ever been vetoed, but Izac remained firm in his conviction that "the bill proposed draining money from the little people and funneling it out to war profiteers." In June of that year the House tentatively adopted a proposal by

IZAC, ED V.—*Continued*

Representative Izac which provided for local authority on the part of the rent director to increase or decrease to a basis of comparability the rents on dwelling houses and apartments. A few days later he led in the defeat of a bill to allow women pilots to enter the Army until all the male aviators trained for the Army were employed although General Arnold advocated Army status for the Women Airforce Service pilots. Izac also opposed the motion to allow Waves to go overseas, insisting that there were enough men to do the work. In February 1945 Izac headed a subcommittee which visited the Naval oil installations in California. His comment on the investigation was: "We have seen at first hand what the Navy is doing toward fueling and powering the war in the Pacific, and we are thoroughly satisfied with the operations both at Elk Hills and the 100-octane plant at Richmond, California." He declared that the trip had been an "eye-opener."

Opposed to Representative Rankin's '44 proposal of a flat bonus to all veterans, Izac, with Representative Lesinski of Michigan, introduced a bill early in 1945 which would provide for a bonus of three dollars per day for home service and four dollars per day for overseas service. It would place a maximum of $3,500 on extra pay for home service and four dollars per day for men who went overseas, with an additional $500 for those who were wounded in action. The money would be paid in bonds maturing in ten years, the veterans being given the option of cashing them in at the rate of one-fifth of their face value for five years. Veterans who would keep the bonds for more than five years would get additional interest compounded annually.

In the spring of 1945, before the Allied victory in Europe, Izac was one of the six Representatives and six Senators appointed by the two Houses of Congress to investigate German atrocities and inspect their concentration camps. Izac, coauthor of the report on the trip, came back convinced that the German people themselves must be punished if a new war was to be discouraged. He advocated confiscating German goods and properties and distributing them to the people whose homes and farms had been looted by the Nazis. Izac felt that, with the camps situated on main highways, the people must have known of the atrocities being committed but did nothing to stop the crimes. He was indignant that the only people in Europe who wore leather shoes were Germans. He was very pessimistic about a harsh peace, however, because of the "forgiving hearts of the Americans."

A few months later, in July 1945, Izac headed a subcommittee of the Naval Affairs Committee which made the first comprehensive survey and study of the Pacific bases of the United States. The subcommittee recommended that the United States keep a string of islands regardless of who owned them before the war. In a House debate on a postwar Navy, Izac demanded that the United States keep control of Okinawa as the northern anchor of the Pacific arc of sea bases. He introduced a bill on September 3 to provide for an increase in the retirement and retainer benefits for Naval and Marine Corps reservists. The bill would allow them a salary amounting to half their former base pay plus all permanent additions. He was the author of the bill fixing the postwar Navy personnel at 500,000 enlisted men and 58,000 officers, an increase of more than 100 per cent over the prewar strength, with the reserves being incorporated in the Regular Navy.

Izac has been decorated by foreign countries as well as by the United States. He was awarded the Congressional Medal of Honor for "service above and beyond the call of duty" during the First World War, and his other decorations include the Croce di Guerra Italy and the Cross of Montenegro. Izac is a former post commander of the American Legion and the Diasabled American Veterans, a national aide-de-camp of the Veterans of Foreign Wars, and a member of the Legion of Valor. He belongs to the San Diego Club and the Catholic Club in the same city. Izac is five feet ten inches tall, and weighs one hundred and fifty-five pounds. He has brown eyes and silver-gray hair, and his favorite form of recreation is camping, hunting, and fishing.

JENSEN, OLIVER O(RMEROD) Apr. 16, 1914- Journalist; author

Address: b. c/o Life Magazine, 9 Rockefeller Plaza, New York City

Oliver O. Jensen was a lieutenant in the Navy when he wrote *Carrier War*, the story of Admiral Marc A. Mitscher's Task Force 58 and its combat record in the Second World War. Based partly on the author's firsthand observations of some of the historic engagements, his "free-running, easy-reading" account of the Navy's great sea-air offensive in the Pacific was hailed as one of the finest books to come out of the war.

Of English and Norwegian ancestry, Oliver Ormerod Jensen was born in Ithaca, New York, on April 16, 1914. He is, however, considered a New Englander, having lived in New London, Connecticut, for a number of years. Jensen attended Phillips Academy at Andover, Massachusetts, and then matriculated at Yale University. At Yale he studied government, and in the summer of 1935 took a bicycle trip through the German Rhineland to observe one type of government in action. Elected a Phi Beta Kappa student, Jensen was graduated from Yale in 1936.

He came to New York to start work on his first job, work which seemed slightly incongruous in view of his political science studies, for he began as a script writer, composing thrillers for radio. He was first employed by Phillips H. Lord, Inc., afterward working with other leading advertising agencies, among them J. Walter Thompson, and Benton and Bowles. There was another period of advertising work when he "counted hams on the shelves of Manhattan and Brooklyn butchers and acted as a spy for the dog-food interests." For a brief interlude the ex-government student also served as an editor of the humor magazine *Judge.* At one point in his career he had begun to contribute articles to *Life,* and in 1940 he joined the staff of that publication.

Jensen's articles in *Life* covered a wide variety of subjects, ranging from the Navy to the private life of film stars, stories written in a breezy, journalistic vein. In September 1941, in an article entitled "Lady of Sorrows," Jensen drew a word-picture of the popular adviser to the lovelorn, Doris Blake '41. In another issue in 1941 a story, "880 Censors in Bermuda," revealed that "this little group of islands has been turned into Britain's Number One listening post, the chief Empire point, outside of England, for censorship and contraband control." This detailed article, giving a glimpse into the secret operations of censorship control in Bermuda, described the routine, personnel, and material handled at the island outpost. Jensen's story in *Life* about Ensign Weems, the top-ranking midshipman at the Annapolis graduation in 1941, was prophetic in some measure of what he was to report four years later in *Carrier War.* Discussing the Navy's requirements for leadership, Jensen remarked, "With the Naval Academy pouring thousands of men of the caliber of young Bee Weems onto a growing fleet of the best ships afloat, it is distinctly possible that the United States is going to have the best of each." Another of Jensen's stories, called "The Navy's Humor," discussed the slang and legends of the Navy, some of which appears in *Carrier War.* Jensen says one of the pieces of which he was especially proud was "The German Language," a humorous discussion widely reprinted.

In June 1942 Jensen took a duration-of-the-war leave from the staff of *Life* to enter the Navy with the rank of ensign. His first assignment was as a watch officer on a four-stack, First World War destroyer. On convoy duty in North Atlantic and Icelandic waters, the vessel fought U-boats through the winter of 1942-43. The severe weather of that winter did not improve life at sea; altogether, according to Jensen, "conditions were startlingly reminiscent of life inside a yo-yo." While on this destroyer duty he also made a few trips on the Caribbean and North African runs. He was later transferred to naval aviation. Then, as an unofficial naval correspondent, Jensen spent several months with a Navy search-plane squadron in England. After his return to the United States, he flew to the Pacific.

The ex-destroyer officer witnessed the landings at Hollandia in 1944 and saw also the raid on Truk. To supplement his personal observation, in order to obtain a complete and authentic picture of the entire Central Pacific campaign for the book he was planning, Jensen consulted official battle records and interviewed hundreds of officers and men who participated in the engagements. Gathering his material from the pilots, crewmen, intelligence officers, commanding officers, and correspondents, Jensen assembled the details of battle while they were still vivid in the minds of fighters and observers. Hence, the text of his completed *Carrier War* retains the tone of informal reporting and the temper of on-the-spot excitement. His narrative pridefully traces the history of Task Force 58 from its first action in the Marcus Island raid of September 1, 1943, through the battles of Wake, Rabaul, the Gilbert and Marshall islands, Truk, Palau, Hollandia, and the epic battles of the Philippine Sea. (The book is based on the same material from which the documentary film *The Fighting Lady* was made.) In his account Jensen has revealed many significant details of the battles for the first time, including the identification of aircraft carriers and other ships which took part in some of the engagements.

LT. OLIVER O. JENSEN

Task Force 58, with its huge aircraft carriers, fast cruisers, big battleships, and destroyers, is "the greatest assemblage of naval might in the world," in his opinion. It has made naval history, administering devastating blows to the enemy with the "Spruance '44 Haircut" and the "Mitscher Shampoo." To Jensen, "everything about a carrier is thrilling, her lines, her impressive bulk, her speed, but the greatest thrill to the oldest hands remains the landing and take-off of her planes."

Life on a great carrier is described, too, with evident pleasure by Lieutenant Jensen. The commander of Task Force 58, Admiral Mitscher, the "fliers' favorite admiral," is depicted as "an astounding, gnomish man who has taken over most of the Pacific for his private duck pond." His fliers are known to the sailors as "airedales" or "birdmen." When one officer was promoted to commander his squadron held a party and presented him with a gift. Accord-

JENSEN, OLIVER O.—*Continued*

ing to Jensen, "There being no regulation caps or gold braid aboard, the gift was a baseball cap with yellow cotton scrambled eggs pasted on top of the long brim and a real stuffed bird pinned on to the spot customarily occupied by the Navy eagle." The author believes that "the American sailor or flier who goes into battle knows where he is going and why."

Jensen's *Carrier War* had been prepared as one of the "Battle Report Series" of the United States Navy, under the auspices of the Council of Books in Wartime. It was published simultaneously, early in 1945, by Simon and Schuster and Pocket Books, by the latter in an oversized "pocket" edition. Generally welcomed as an illuminating battle account, the book was sold out within a few days after publication. The March 26, 1945, issue of *Life* carried excerpts from the book.

Critical reaction to Jensen's book was good, with most reviewers recommending it as a magnificent story, well told. It was described as "lucid and stimulating," and the author was lauded for the "restrained language, a complete lack of melodramatic luridness, scrupulous accuracy, and a detailed knowledge of events." In dissenting tone, Hanson W. Baldwin '42 objected to one factor beyond the author's control, the "unmistakable evidence of rigorous and stupid censorship, so sweeping that one knows little more when he has finished this book than a careful student of the Pacific war knew before." Describing *Carrier War* as a paean of praise and a song of glory for the flattops, Baldwin called Jensen's style unfortunate for the serious intent of the book. "The reader feels a sense of motion, but not of emotion, the writing is graphic, but in too impersonalized a way." Still another critic, Lewis Gannett '41, primarily concerned with the substance of Jensen's story, commented that the "new semi-aerial Navy" disproved Major de Seversky's '41 theory of the superiority of land-based aviation. The collection of photographs in *Carrier War* was singled out for special commendation by most critics, who found them excellent complementary material for a "brilliant and highly readable" text. These photographs had been gathered from many sources, some of them taken by the author himself.

The foreword for Jensen's book, written by Artemus L. Gates, Assistant Secretary of the Navy for Air, states: "This proud story of America's new big carriers brings profound satisfaction to the Navy. *Carrier War* is an excellent account of their achievements in the Pacific and of the sights and sounds of battle as they actually exist." Included in the narrative are frank discussions of strategy and mistakes, and descriptions, for example, of thrilling rescues at sea and drama in the vivid details of the tragedy of the *Liscome Bay*. The author's concern for human detail and his keen sense of humor have been noted throughout. One critic remarked that while Jensen gives credit to the ship, "his heart is with the fliers."

Another comment, this on the young author himself, reveals that he is a tall man, six feet, four inches in height, and that he has sharp features. His resumption of civilian life will begin on January 2, 1946, the date for which his release from the Navy is scheduled. In the course of his duty on the *Yorktown*, he crossed the International Date Line several times, but only once, in April 1944, did it bother him: "The sixteenth simply disappeared, a disturbing matter personally since it happened to be my birthday."

JOHNSON, HALL Mar. 12, 1888- Choral director; composer; arranger

Address: h. 5219 McKinley Ave., Los Angeles

Hall Johnson, composer and arranger, and founder and director of the Hall Johnson Negro Choir—which has been known throughout the United States since the twenties for concert, radio, and motion picture appearances—"came early under potent and religious influences." Johnson was born March 12, 1888, in Athens, Georgia. His father, the Reverend William Decker Johnson, was the minister of the African Methodist Episcopal Church; his mother, Alice Virginia (Sansom) Johnson, was a former slave—until she was a child of eight. His grandmother, too, had been a slave; and from this woman, Mary Hall Jones, the boy Hall learned the spirituals of his race. Many of those which his choir sing today he has never heard from any other source; and where she got them, he says, and how long ago, he often wonders.

Hall graduated from the Knox Institute in Athens when he was fifteen, then went to Atlanta University for a year. His father had meantime become president of Allen University in Columbus, South Carolina, and young Johnson was graduated from there in 1908. He had started to study the piano with an older sister while he was still a child, but not until he was a student at Allen University did he take up music in earnest. With a ten-cent self-instructor he taught himself to play a violin his mother had given him, and in a short time he was proficient enough to become a member of the dance orchestra of a local summer resort. By 1908 he had saved sufficient money to go to Philadelphia for his music lessons.

For the next five or six years the young musician worked and studied in Philadelphia. He took violin lessons at the Hahn School of Music, attended the weekly concerts of the Philadelphia Orchestra, and studied at the University of Pennsylvania's School of Music, from which he was graduated in 1910 with the Simon Haessler Prize for the best composition for orchestra and chorus. Two years later, in November 1912, he was married to Celeste Corpening, a friend from his days with the local Athens orchestra. (Mrs. Johnson died in 1935.)

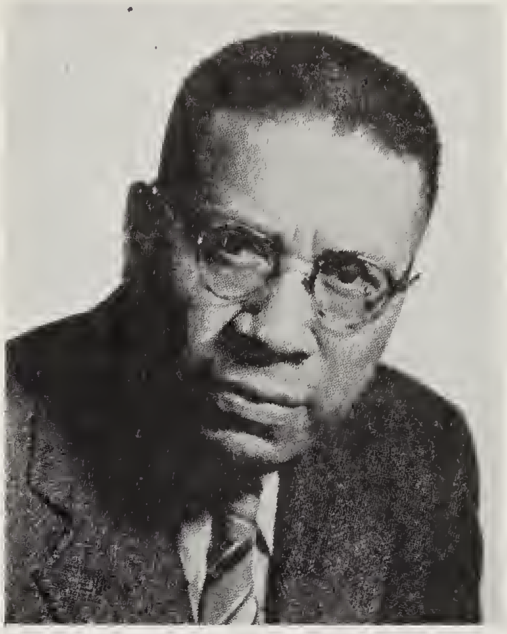
The young couple went to New York City in 1914 because of the current demand there for Negro musicians in dance orchestras. Johnson became a member of the orchestra of Vernon and Irene Castle, he played in theaters, and toured the country with leading Negro attractions, including the revue *Shuffle Along*. During the war he was with Jim Europe's band. He studied, too: French and German with tutors, and music at the Institute of Musical Art in 1923-24.

Meanwhile Johnson, who already had had published transcriptions of several spirituals, conceived the idea, according to Karl E. Downs, of organizing a Negro choir that would be comparable to the Russian Don Cossack ensemble. In December 1925 his Hall Johnson Negro Choir of eight singers came into being in Harlem. It was not until February 29, 1928, however, that the choir, expanded by then to a mixed group of twenty voices, gave its first concert in a regular New York City auditorium—in the Pythian Temple. A month later, on March 20 in Town Hall, it gave its second concert. Other engagements followed quickly that first season; then for the next eight years the gradually expanding group was kept busy with radio, theater, and concert appearances, in both New York and on tour. For six consecutive seasons, beginning in August 1928, the choir made joint appearances with the Philharmonic Symphony at the Lewisohn Stadium in New York. John Mason Brown '42 once called the group "an all-American miracle."

The programs of the Hall Johnson choir are composed of both spirituals—"devotional songs, episodic songs, or songs of religious experience"—and the secular songs of the Negro—"the work songs of the levee, the rock pile, and the cotton field, the numerous lullabies and songs about animals, and . . . the social songs, the reels and ballads of the Negro in his hours of relaxation." "These traditional folk melodies," wrote Johnson for the first concert, "will be given in a manner which will reproduce the fervor of the camp meeting which gave them birth. . . .Beyond clarity of diction and fair precision of attack, no attempt is made to secure a perfect choral ensemble as generally accepted. We believe this enables us to preserve an emotional content that would be lost with greater refinement of method."

Critics at these early concerts found indeed that Johnson had not allowed his musical training to color his understanding of the essential simplicity of this folk music. Most of them found listening a new experience because, instead of following in the pattern of the small Negro ensemble that had been popular during the early twenties, Johnson attempted to recreate the effect of the old camp meetings with his larger group. His arrangements (the choir always use Johnson's arrangements) avoided the polished sophisticated form of other groups, thus enabling the choir to sing "as Negroes do when they do it spontaneously." "I have hardly ever heard such a direct expression of the source from which art is created," wrote conductor Willem van Hoogstraten in 1928.

Similar expressions of enthusiasm came from other critics. The group, declared Walter Damrosch '44, "sing with fine precision, beautiful tone quality, and, above all, with a deep inner emotion which fairly sweeps the listeners along." "They use the true Negro portamento suspected as the origin of jazz," commented W. J. Henderson of the New York *Sun*, "and they sing with the inexorable beat often lost by white singers." Others described the music as retaining its primitive appeal, elemental power, and, in the case of some songs, the deft humor. In a Stadium concert in 1938, however, during a return engagement in New York (Johnson and his group had been doing choral work in Hollywood movies since 1935), there was evidence that some of the simplicity and depth that critics had formerly found praiseworthy was missing. Some of the arrangements, wrote the New York *Times* reviewer, seemed over-sophisticated. "Johnson occasionally allowed himself harmonic elaboration and tricky effects in the accompaniments that are for one thing more instrumental than vocal and for another are entirely unsuited to the style of the Negro folk song."



HALL JOHNSON

Johnson's transference to Hollywood for such pictures as *Lost Horizon* (1937), *Way down South* (1939), *Swanee River* (1940), *Cabin in the Sky* (1943) had followed two Broadway presentations. The second, *Green Pastures* (1930), won for the choral director in 1931 the Harmon award for his arrangements and direction of the music, and an invitation to make the film version (released in 1936) of the play. The first offering, *Run, Little Chillun* (1933), for which he did the book and music, received a mixed reception. (It was produced in New York again in 1943, and in Los Angeles and San Francisco in 1938-39, following Federal Theater and other presentations throughout the country.)

The play had evoked much controversy. Its action revolved around the struggle between an itinerant moon-worshipping group, the New Day Pilgrims, and a Negro Baptist church over the soul of the Baptist minister's son, who had been seduced by a disciple of the nature cult. The two most discussed scenes in the music drama were the Pilgrims' religious orgy in the woods and the revival meeting of the Baptists. By many people, *Run, Little Chillun* was described as folk art. In contradiction Margaret Marshall of the *Nation* declared that, far from being such, it showed that the author had very confused ideas himself of what he was up to. The circumstances which produced the true Negro folk art no longer exist, she explained; and "any attempt to reproduce the forms of expression growing out of their [the Negroes'] experience as a folk can result only in senti-

JOHNSON, HALL—*Continued*

mentality, condescension, and bar art." On the laudatory side, critics referred to the play—in words summed up by Robert Garland of the New York *Sun*—as "noble and magnificent, superb and orgiastic, startling and ecstatic, savage and appealing, frenzied and moving, elemental and emotional"—some reviewers at the same time calling it a bad play.

"The exceptionally intimate association of speech and song, action and dance," wrote Olin Downes '43, "gave an expression which is genuinely racial. . . . *Run, Little Chillun* is far from finished drama or opera . . . but it has real life and genuine musical qualities." Burton Rascoe declared that Johnson had shown, by "tremendous dramatic implication," how a new Negro religion—"developed out of the Negro's own essential nature and not grafted on through contact with other peoples"—"must inevitably fail as long as he is kept in a semi-slave state by the whites."

On the negative side the criticism was equally intense. The play is, wrote Louis Kronenberger '44, "a crude tale of sex and religion in which, at times, it is hard to tell one from the other. Now and then a certain intensity overrides the general clumsiness, and here and there a certain naïveté is not unattractive in itself. But as drama, *Run, Little Chillun* is mostly inept or absurd, and the chief virtue . . . is a lot of good choral singing." Hall Johnson's "sense of what makes superlatively good theater has far outweighed his sense of what makes impressive drama, and has quite obliterated his sense of what makes for better understanding of the simpler and finer spiritual qualities of the Negro," wrote a *Commonweal* critic. "One could leave this play saying that the Negro's religious instinct is confined solely to emotional excitement. And that, I am convinced, is a serious calumny. It is quite as if we were to take the worship of Pan as the whole symbol of the civilization of Greece," the reviewer concluded.

Although Johnson and his choir continued to make radio and concert appearances outside of California after 1935 (in 1944 they were the summer replacement for the *New World A-Coming* series over WMCA, and in May 1945 they were in a vaudeville revue, *Blue Holiday*, with Ethel Waters), their film engagements for the most part confined them to concerts on the West Coast. In 1941 Johnson established the Festival Negro Choir of Los Angeles, a training group of two hundred. It is a nonprofit community effort, and all proceeds from the concerts go toward maintaining scholarships for talented young Negroes. Besides his directorial duties and his arranging and composing—he has completed the book and music for a Negro operetta to be entitled "Fi-yer"—Johnson contributes articles on Negro music to various magazines. He is the recipient of an honorary D. Mus. from the Philadelphia Musical Academy.

The tall, bespectacled choral director has, to quote one newspaperman, "the longest imaginable arms, the supplest imaginable fingers" (both called "necromantic" by another critic). After one concert a reviewer commented: Johnson "lead the choir by sign language of hands, arms, body, and head . . . that bore no conceivable relation to the . . . white man's art of conducting." As for his hobbies, Johnson once described them: "I still have my intense love for pictures, but it expresses itself through the camera. Next to that are my cigarette holders of all shapes, lengths, and materials. I play my unusual records [swing included] while smoking from my unusual holders while taking unusual photographs of my unusual friends."

JOHNSON, J(OHN) MONROE May 5, 1878- United States Government official; civil engineer

Address: b. Office of Defense Transportation, Washington, D. C.; h. Marion, S. C.

The man charged with the formidable task of keeping the wheels of transportation rolling in the United States during the emergency created by the war is a veteran of military and industrial campaigns. As director of the Office of Defense Transportation, appointed April 4, 1944, J. Monroe Johnson was faced with unprecedented problems in maintaining the increased and accelerated traffic of military passengers and freight at the same time that civilian needs had to be met.

The son of John Monroe and Emma Crider (Richardson) Johnson, John Monroe Johnson was born May 5, 1878, in Marion, South Carolina. The elder Johnson was a lawyer and plantation owner who had served as an engineer in the Confederate Army. While he looked forward to a law career for young John, he also believed that a knowledge of engineering would be of value to a lawyer. The youth therefore took courses in two fields. He first attended the University of South Carolina for a year (1895-96), and then took a technical course the following year at Furman University in Greenville (1896-97). But his studies were interrupted by the outbreak of the Spanish-American War. Johnson volunteered for service and attained the rank of sergeant. Returning home from the war he opened an office as a civil engineer in Marion, South Carolina. Under the firm name of Johnson and Roberts this office has been maintained continuously since 1898. Thus established in business, the ambitious young engineer was married to Helen Barnwell in 1900. The couple had met in Charleston when Johnson was a soldier.

Johnson's career as a civil engineer progressed so successfully that at thirty he abandoned the idea of becoming a lawyer. He executed several large engineering jobs in various parts of South Carolina, building drainage systems, roads, and bridges. Among his principal projects were the Cow Castle Drainage District in Orangeburg and Godfreys Bridge in Gresham. From 1911 to 1914 he served on the Marion County Highway Commission. Two years later he was appointed chairman of the South Carolina State Highway Commission, a position he held for one year. In 1916, at the request of the Governor of his state, Johnson recruited a company of military engineers for service on the Mexican border. In 1917, with America at war, Governor Richard I. Manning again asked Johnson to recruit and head a battalion of engineers. Johnson accepted the assignment with the provision that the group be given immediate overseas service. In twelve hectic days Johnson organized the battalion. It became the First Battalion, 117th Engineers of the famous Rainbow Division, whose chief of staff was General Douglas MacArthur '41. Johnson is a close friend of MacArthur's and holds him in high esteem, describing the General as a "great soldier."

In the course of the war Johnson rose from the rank of major to a colonelcy, and became chief engineer of his division. He participated in all its campaigns and later served with the Army of Occupation. His service in the field won him military honors—among his nine decorations are the Distinguished Service Medal, the Verdun Medal, the French Legion of Honor, and the Belgian Order of Leopold II. Johnson is a charter member of the American Legion and served on that organization's national executive committee from 1919 to 1936. He is also a member of the Military Order of the World War and the American Society of Military Engineers, which group he served as president in 1940-41. (Johnson also belongs to the American Society of Civil Engineers, and the American Association for the Advancement of Science. His fraternities are Sigma Nu and Omicron Delta Kappa, and his Washington clubs are Army and Navy, Chevy Chase, and Burning Tree.)

Upon his discharge from the Army Johnson resumed his engineering duties and in 1928 was appointed South Carolina's boundary commissioner. Until his first Washington appointment he was chiefly a consulting engineer. Then, in 1935 the South Carolinian became Assistant Secretary of Commerce. In this capacity he had jurisdiction over all the transportation activities of the Department, and made himself heard on many issues. Of his years as Assistant Secretary of Commerce, Delos W. Lovelace remarks: "Some corners of Washington still echo with the arguments he set forth then in favor of a transatlantic line of dirigible airships." But the irrepressible Johnson did not confine himself to expressing his views for the benefit of the Capital. His forthright arguments found their way into print in the form of articles devoted to different phases of transportation. The *Congressional Digest* of February 1936 carried a detailed article by Johnson entitled "The Plight of Our Merchant Fleet Today." The author urged immediate modernization of the merchant fleet. He illustrated statistically the inadequacy of the fleet and called for measures "to place the American Merchant Marine on a parity with the modern fleets of our foreign competitors." The May 1938 issue of the *American City* contains a portion of Johnson's address before the 1937 Annual Conference of the United States Conference of Mayors. In this speech, entitled "Municipal Airport Problems," he discussed the practical issues involved in aircraft transportation in the United States. Advocating the formulation of a national aviation plan, Johnson stressed the necessity of reaching a comprehensive airport program satisfactory to all interests concerned.

J. MONROE JOHNSON

In May 1940 President Roosevelt '42 appointed J. Monroe Johnson a member of the Interstate Commerce Commission. At the time of the appointment White House spokesman Stephen Early '41 reported that the President had been urged by many Senators to choose a man familiar with the transportation problems of the Southern states, and, as Assistant Secretary of Commerce, Johnson had had jurisdiction over the Inland Waterways Corporation. At this time, Joseph B. Eastman '42, Johnson's predecessor at ODT, was also serving on the Commission. *Newsweek* reports that after his appointment to the ICC, Johnson "shared many an aspirin with Eastman as they struggled with transportation enigmas." Johnson had originally been appointed to the Commission to fill the unexpired term of resigning Marion M. Caskie. However, when Johnson's tenure expired in December 1941 he was reappointed for a full term, to expire December 1948. Shortly after Johnson took up his duties with the Commission he was placed in charge of the Bureau of Service, which supervised the use, control, supply, movement, exchange, and distribution of locomotives, cars, and other vehicles used in the transportation of freight. All this provided thorough grounding for the post that was to follow, the directorship of the Office of Defense Transportation.

President Roosevelt appointed Johnson to the ODT post on April 4, 1944. The selection was generally well received, *Newsweek* commenting:

JOHNSON, J. MONROE—*Continued*

"Railroad officials like the appointment of J. Monroe Johnson as ODT director. . . .They believe he will help heal the breach between the ODT and the Interstate Commerce Commission." In addition to serving in his new post, Johnson remained as a member of the ICC, but was relieved of routine duties. However, he continued to retain supervision of the Bureau of Service of the ICC, which enabled him to keep in touch with the operational problems of the railroads. Johnson swung into his new job with a strong warning: "There will be no shortage of military transportation. We will not hesitate to take any steps to provide it. If people take vacations, they may find themselves stranded away from home. We are on the eve of a great offensive. Watch out!"

Upon assuming the leadership of the Office of Defense Transportation Johnson was faced with the emergency conditions of the severely overburdened transportation system of mobilized America. He has worked consistently to ensure the movement of essential military freight and has on several occasions issued stringent orders. When transportation facilities were hampered by bad weather conditions in January 1945, Johnson instructed the railroads to discontinue passenger service wherever such action was required to keep wartime transportation moving.

Previously, when the pressure of troop movements and war freight reached record-breaking proportions, the ODT had requested the cancellation of all conventions and meetings not concerned with the war effort. The ban on nonessential conventions became effective in February 1945, and Johnson served as chairman of the War Committee on Conventions which considered requests for permission to hold conventions. On January 17, 1945, the White House made public a memorandum from Johnson to the President stating that the transportation of out-of-town guests not officially needed at the inaugural ceremonies would add "an alarming burden" to the transportation difficulties.

In is program of further curtailment of civilian travel, the ODT banned transportation for animal shows; ruled that coal-burning passenger trains operating at less than 35 per cent capacity cease "without exception"; asked New York City's millions to avoid traveling during rush hours when possible; appealed to state governors to enforce the wartime Federal speed limit of thirty-five miles an hour for motor vehicles. Big league baseball officials who were asked to consider curbs on transportation of their teams made two voluntary travel curtailments after conferences with Johnson.

Immediately after V-E Day on May 8, 1945, it was announced that, in view of the prodigious task of redeployment of men and materièl, no wartime controls over transportation could be relaxed. "Sports will be lucky to play out regular schedules this summer and fall unless Japan quickly folds up, relieving the burden on transportation," declared Johnson. A fifteen-point travel reduction program for college and high school athletics, including the elimination of post-season events, was announced a few days afterward. In late May Johnson recommended that the Army release fifty thousand experienced railroad men in uniform in order to help move members of the armed forces across the United States.

As the railroad crisis mounted, on June 29 the ODT decreed that reservations on passenger trains might be obtained no more than five days in advance instead of the usual thirty, and ordered four thousand soldiers furloughed for thirty days' work on the railroads to avert a breakdown in service. In July additional emergency measures were adopted: all sleeping car accommodations in use on trips between points 450 miles or less apart were banned; the transportation of race horses or show animals by railroads was prohibited; all Government agencies and departments were directed to make further reductions in travel. The country's entire supply of railway passenger coaches, express, and baggage cars was put at the disposal of the Army on July 17.

Testifying before the Mead '44 War Investigating Committee on July 23, Director Johnson placed responsibility for much of the growing congestion in redeployment on the Army and on the manpower shortage. Despite the ODT's responsibilities in the movement of all transportation in the United States, it was not consulted in advance on the redeployment plans, Johnson asserted. The information the agency had received, he added, was so incomplete that adequate preparation for the unprecedented traffic was defeated. Following Johnson's claim that the railroads required seventy-five thousand more men "right now," Chairman Mead proposed that the Army discharge or furlough servicemen working on railroads overseas. Although Army officials discounted Johnson's charges, claiming the railroad jam was not serious, on July 31, yielding to demands of Congress, Johnson, and other officials, the Army receded from its stand against releasing experienced railroad men with the necessary points for discharge.

After V-J Day on August 15, 1945, wartime restrictions began to be lifted gradually. Among the regulations swept out of existence were seven controls over commercial motor vehicle traffic; curbs on travel to sporting meets; limitations on wholesale and retail truck deliveries; the thirty-five-mile-an-hour speed limit; controls over local bus, trolley, coach, and streetcar services. In September bowling's major events were restored to the sports calendar for 1946. However, "wartime conditions" prevailed at the holiday season as ships brought more than a million servicemen to the ports on both coasts. With civilians also intent upon spending Christmas at home, Johnson warned that disappointment awaited many would-be travelers.

Johnson is a lean, gray-haired, ruddy-complexioned man who has retained the candid speech and manner of his youth. His direct approach to problems has been apparent throughout his Washington career. The press has commented on his bluntness, one magazine describing the reaction of the office staff at the ODT after the new director took over: "Five minutes after Colonel Johnson took office they knew the engineers had landed. They heard a voice that would have been audible to a deployed regiment. Orders came with a crispness and finality that only a veteran campaigner could produce." And Johnson is a busy man—

as transportation chief he finds little time to travel.

JOHNSON, VAN Aug. 25, 1916- Actor
Address: b. c/o Metro-Goldwyn-Mayer, Culver City, Calif.

One of Hollywood's newest and brightest stars, known only to a few movie-goers before 1944, is Van Johnson, who rose to stardom within a short year. Both men and women are counted among his admirers, it is reported, but he has also a special appeal for "female adolescent America," who see in his youth and vitality the ideal "boy next door."

The only child of Charles E. Johnson, a real-estate salesman, and Loretta Johnson, Van Johnson was born in Newport, Rhode Island, on August 25, 1916. Although he is often thought of as Irish, the actor is of Swedish descent. When Van was three years old his mother and father were separated. He was consequently reared by his father and grandmother, strict disciplinarians, who saw to it that the boy had a carefully supervised but pleasant childhood. Young Van received his elementary schooling at Calvert Grammar School, in Newport. After school hours he worked at odd jobs—mowing lawns, shoveling snow, delivering groceries, selling magazine subscriptions. Of those days Johnson recalls: "It wasn't that I loved work so much, but that I loved possessions more. Dad had one rule: I could have what I wanted if I earned the price of it myself."

Studying singing, dancing, and the violin, Van became stage-struck before he had even reached his teens. Specifically, Johnson says, that attraction began when he appeared for the first time in one of the annual shows presented by his music and dancing teachers. Wearing a straw hat and carrying a cane, the talented child went through a few Jack Donohue and Jack Whiting routines. With a zeal which Johnson now dismisses as "showing off," he and some friends turned all the unused barns in the neighborhood into theaters. And with that preliminary taken care of, Van proceeded to write the plays and cast himself in the leading roles. As Johnson now says, "Other small fry might be permitted to say 'Ouch' or 'Here come the girls,' but it was Master Johnson who played the extremely dashing heroes." While attending Rogers High School, the aspiring actor experienced his first bit of discouragement when he failed to "make" the dramatic club. He therefore turned his extra-curricular interests to playing the violin in the orchestra and to exhibiting his athletic skill on the basketball and baseball teams. Outside of school, in his free time Van performed at the Lions Club or the Kiwanis, attended Newport's Casino Theatre where such stars as Ruth Chatterton and Alice Brady appeared in plays, and went to the circus or the movies.

VAN JOHNSON

Upon Johnson's graduation from high school in June 1935, his father urged him to enroll at Brown University to study law. Not interested in law as a vocation, Johnson tried, instead, to find a singing or dancing job. He was unsuccessful in his efforts the first summer and spent the season frying clams in a roadside restaurant which catered to tourists. While working here Johnson was urged to try his luck on Broadway by the manager of the restaurant—a young lady whom Johnson admired, and whom he describes as having "brains, breeding, beauty and courage." In September 1935 Johnson left Newport for Broadway, confident that he would be able to achieve success quickly and then marry his ex-employer, who however, married another suitor.

Life was very hard for Johnson during his first few months in New York and his confidence began to wane. He haunted the agencies, Johnson tells: "I tore the names and addresses of actors' agents out of the classified section of the phone book, starting with the A's and working down alphabetically." Finally, in December, the disheartened actor, exaggerating his experience, won a part in a revue called *Entre Nous,* which unfortunately had only a four-week run at the Cherry Lane Theatre in Greenwich Village. With his funds very low, he reluctantly accepted a job as a substitute dancer with a group that was touring New England, but after a short while he left the company. A few months later, in May 1936, almost a year after his arrival in New York, he got his first chance on Broadway. While watching a rehearsal of a new show called *New Faces* with a friend who was a member of the cast, Johnson was mistaken by the director for one of the performers and told to get on the stage. Bewildered for the moment, he nevertheless obeyed the order, and "knocking himself out," he was rewarded with a part in the show. He worked in *New*

JOHNSON, VAN—*Continued*

Faces for forty weeks, earning forty dollars a week, and when the show closed in early 1937 Johnson became a chorus boy at the Roxy Theatre. Shortly afterward he went on the road for several months as the third member of the comic team of Buster West and his wife, Lucille Page. In the summer of 1938 he entertained at hotel resorts, gaining diversified experience, in singing, dancing, playing the violin, and acting.

In early 1939 Johnson did his first bit of night club work, when he appeared as one of the *Eight Young Men of Manhattan*, an act written around Mary Martin '41 for the swank Rainbow Room. In 1940 Johnson was back in the theater again—this time in George Abbott's '40 *Too Many Girls*. As the understudy for the three male leads, Richard Kollmar, Desi Arnez, and Eddie Bracken '44, Johnson on several occasions had an opportunity to play one of the major roles. On the strength of these few performances he was given a fairly important part in another George Abbott production, *Pal Joey* (December 1940). In this he did a dance number with June Havoc and spoke about ten lines of dialogue. While *Pal Joey* was still running Columbia Pictures invited Johnson to Hollywood. Unimpressed with his subsequent screen test, however, the studio did not offer Johnson a contract, and the discouraged actor returned to New York and resumed his part in *Pal Joey*. But Hollywood had not completely rejected him. In early 1942 Warner Brothers '45 offered Johnson a six months' contract at three hundred dollars a week, and Johnson immediately went again to Hollywood. At the end of five and a half months he received four months' salary (his contract entitled the studio to release him for six weeks), but he had not been given an assignment. Two weeks before his contract was about to expire, Johnson was given the leading role in the picture *Murder in the Big House* (1942). Upon the completion of this "B" picture, which took all of twelve days to produce, the studio dropped Johnson's option.

With his future in motion pictures very uncertain, in the middle of 1942 Johnson decided to return once again to New York. However, while having dinner with Lucille Ball on his last night in Hollywood, Johnson was introduced by Miss Ball to Billy Grady, MGM talent scout. Grady was persuaded by Miss Ball to give the young actor a chance and asked Johnson to report to the studio the next morning. Almost immediately Johnson was given make-up tests, voice tests, and dramatic coaching—all in preparation for a *Crime Doesn't Pay* short. The result was that MGM signed Johnson to a contract. Playing the part of a soldier in a bit part, Johnson made his motion picture debut in *Somewhere I'll Find You* (1942), in which Clark Gable '45 and Lana Turner '43 were starred. Johnson then appeared before the year was over in *The War Against Mrs. Hadley, Skyway to Glory*, and in *Dr. Gillespie's New Assistant*, one of the series starring Lionel Barrymore '43.

In 1943 Johnson began to work steadily in Hollywood. He appeared as Marcus in *The Human Comedy*, as the reporter in *Madame Curie*, as a pilot in *Pilot Number Five*, and as the young pilot in *A Guy Named Joe*. The production of *A Guy Named Joe*, in which Johnson had been given the coveted part of Ted Randall, was early interrupted by a near-tragedy—Johnson was badly injured in an automobile accident. Afraid that he would be replaced in the movie and thus lose his first good opportunity in Hollywood, he was overwhelmed when he learned that both Irene Dunne and Spencer Tracy '43, the stars of the film, had asked that work on the picture be suspended until he could recover. His three-month confinement in the hospital won him wide publicity, and his acting in the film, which was finally released in December 1943, won him the favorable notice of Howard Barnes of the New York *Herald Tribune*: "Van Johnson . . . contributes a superior performance to the film."

In 1944 Johnson achieved stardom. His performances in *The White Cliffs of Dover, Two Girls and a Sailor, Between Two Women,* and *Thirty Seconds Over Tokyo* established him as a versatile actor. In *Thirty Seconds Over Tokyo*, the story of Captain Ted Lawson's '43 Army bomber crew and the first American raid on Japan, Johnson (as Lawson) gave "a warm and brave performance and managed quite well to achieve a moving tenderness in love scenes and rigid strength in the action field," in the opinion of Bosley Crowther of the New York *Times*. *Time* found that Johnson played the role with "unusual heart and simplicity," while Pete Martin, writing in the *Saturday Evening Post*, said: "A few more opportunities like that and he may take the same grip on the grown-up public that he now has on the wearers of beanies, friendship rings, and charm bracelets." In May 1945 the actor appeared in the lavish musical *Thrill of a Romance* with the swimmer Esther Williams. Portraying an Air Force hero on furlough, Johnson, according to the critic of the New York *Herald Tribune*, "gives the type of performance that has endeared him to the younger set. He is the antithesis of the 'wolf' . . . clean cut, amiable, a little shy and needing aid and comfort." Eileen Creelman of the New York *Sun* found that "he makes a pleasant hero of the light comedy."

Another 1945 picture was *Week-end at the Waldorf*, in which Johnson's portrayal of the young Army captain was judged "boyishly appealing." Later that year he was working on the set for the film *No Leave, No Love*. Forthcoming films in which his appearance was announced are: *The Common Sin*, an episodic story by five authors; the film adaptation of Booth Tarkington's novel *The Image of Josephine*; *Till the Clouds Roll By*," a screen biography of the late Jerome Kern; and a picture to be based on Cardinal Spellman's story "Risen Soldier." The year 1945 closed with Van Johnson occupying second place among the first ten "biggest money-making" stars of the year—the first time he could be included in that group.

The eight thousand fan letters Johnson receives each week from his admirers are a measure of his wide popularity. Much of the actor's mail reads: "Please don't get married, wait for me." In the hope that their idol is immune to Hollywood's beauties, Johnson's teen-age worshippers feel that "nabbing Johnson for a spouse" is a free race for all. As if answering their prayers, he has recently said, "I'd love to get married . . . but I don't think it will be an actress. One actor in the family is enough. . . .She should be an active person who plays tennis and rides horseback and has a sense of humor. She must like to dance but beauty is not essential." Concerned over the mass hysteria that greets the actor when he appears on the stage, his studio is refusing all requests for personal appearances. Pete Martin, who apparently had an eye-witness account from Hedda Hopper, describes a descent of a "bobby-soxers' blitz" upon Johnson: "The heat engendered by an opportunity to see and touch Johnson . . . shaped up very much like Pickett's charge at Gettysburg. A milling mob flowed around parked autos, climbed over them, and crawled under them, chasing a tall, reddish-blond guy with a determined grin on his face. Every now and then they caught up with him and engulfed him in a chorus of shrieks, shouts, and girlish giggles."

Van Johnson's reddish hair goes well with his blue eyes, freckles, snub nose, and "delayed action" smile. Picture magazines often show his six-foot-three, 185-pound figure clad in a bathing suit; and among his other recreations are roller-coasting, meeting other stars, and watching as many as five movies a week, although he shuns his own pictures. He still suffers from the severe headaches that followed the automobile accident and resulted in his classification as 4F. Shy, serious, and hardworking, he hopes to improve his acting and to play comedy parts "mixed with a little drama." Because of the numbers and persistence of his admirers, he moved from his Brentwood home, and in 1945 was living in a hotel hideaway in Los Angeles. Of his newly acquired fame he says, "I've been a very lucky guy."

JUDSON, ARTHUR (LEON) Feb. 17, 1881- Concert manager

Address: b. c/o Columbia Concerts Corp., 113 W. 57th St., New York City; h. 133 Woodrest Ave., White Plains, N.Y.

Ben Greenhaus

ARTHUR JUDSON

Throughout a career as violinist, professor, artist and orchestra manager, radio station and festival founder, Arthur Judson, president of Columbia Concerts Corporation, has been guided by one dominant motive: to bring the best of classical music, interpreted by the greatest artists, to as many people as could be reached. Once a music-hungry youth in a "musically ignorant" small town, he has earned through his subsequent efforts a reputation as "the dean of American concert managers and [the] architect of a vast democratic musical program for America." In the opinion of Olga Samaroff, he developed the possibility of the community concert series "with a skill and breadth of conception that is unequaled."

A native of Ohio, although he has for many years made his home in New York, Arthur Leon Judson was born in Dayton on February 17, 1881, to Francis H. and Mary M. (Myers) Judson. At the age of twelve he was introduced to the study of the violin and thereafter for a time had thought of becoming a violin virtuoso, an ambition he abandoned when he realized that he was less gifted than other violinists whom he heard. "I was a good violinist," he says now, "but no Kreisler ['44] or Heifetz ['41]." However, after working his way through Denison University in Granville, Ohio, he decided that music in some form was what he wanted, and finding none to his satisfaction either in Dayton or Granville, he left for New York in 1900. "I wanted to hear good concerts," he explains, "but nobody ever came to Dayton, so I came to New York." In New York, where he remained for less than a year, Judson studied the violin with Max Bendix, violinist, conductor, and composer, and with Leopold Lichtenberg. He earned his living and gained experience meanwhile by playing the instrument in various small orchestras and by conducting, including one orchestra of one hundred men at Ocean Grove, New Jersey.

Within the year Judson returned to Ohio to become, despite his comparative youth, a pro-

JUDSON, ARTHUR—*Continued*

fessor of the history of music, and the dean of the Conservatory of Music, at his college, Denison University. Before he resigned from that position in 1907, notes *The International Cyclopedia of Music and Musicians*, he had built up the orchestra, sponsored concerts, instituted the annual Granville Music Festival, and developed the small conservatory into a progressive institution of musical education. During those years he had also written a guide to the study of musical history (*History of Music*, published by the Granville Festival Association in 1905) in which he discussed the relation of cause and effect in the history of music from the Crusades to modern times. Returning to New York in 1907, Judson joined the staff of *Musical America*, where he was to remain for nearly eight years, first in the editorial department, and later as advertising manager of the publication.

The year 1915 was the turning point in Judson's career. For the first time he was able to realize his ambition to become, as one interviewer has called him, a "salesman of fine music." In July 1915, having left the staff of *Musical America*, he was appointed manager of the Philadelphia Orchestra, then under Leopold Stokowski's '41 direction. At the same time, investing $250 of his savings, he launched his own musical booking agency, Concert Management Arthur Judson, Inc., in Philadelphia, soon following that venture with a second office in New York. His aim was twofold: he wanted to make American audiences more music-conscious, and he wanted to help artists of ability who might not become public successes without good management. Then, already dividing his time between Philadelphia and New York, Judson in 1922 took on the added duties of business manager of the New York Philharmonic-Symphony Orchestra, at that time known as the Philharmonic Society of New York.

In September 1926 the concert manager further expanded his activities when he organized a pioneer excursion into the sphere of radio entertainment at a time when radio was still thought of mostly as a means of communication with sinking vessels or polar expeditions and hardly as a medium for artistic expression. But Judson foresaw its inherent possibilities, and the Judson Radio Program Corporation was born to utilize them. "When we broadcast our first concert," he recalls, "we had to turn away hundreds of people. I knew then that radio could become the great common denominator, the instrument for bringing good music to the whole people." "It's a mass medium," he says today, "and, thanks to it, good music is becoming everybody's music."

Little more than a year after the formation of the Judson Radio Program Corporation, the aim of which was to present performances by great artists to a larger public than could be reached in the concert hall, Judson, in another move to popularize classical music, was instrumental in laying the foundation for the Columbia Broadcasting System, which "has made notable contributions to the cause of good music in the United States." In that year (1927) Judson, together with George A. Coats and Major J. Andrew White, established the United Independent Broadcasters, Inc., to make participation in chain broadcasts practicable for independent radio stations. Taking a year's lease on the facilities of Station WOR and utilizing its own station, WABC, the new company began operations under Judson's direction with sixteen stations. After a process of reorganization involving several changes of name and ownership of the new network, the Columbia Broadcasting System emerged in 1928. Although Judson's active share in the affairs of the Columbia Broadcasting System ceased in 1930, he is still one of that corporation's major stockholders.

Meanwhile, Judson expanded Concert Management. In October 1928 that organization, together with Judson's Radio Program Corporation, absorbed the Wolfsohn Musical Bureau, the oldest concert management bureau in the United States (having been founded in 1884). Another merger in 1930 united Judson's agencies with four of his prominent competitors—Haensel and Jones, The Metropolitan Musical Bureau, Evans and Salter, and the American Opera Company—to form Columbia Concerts Corporation. The Columbia Broadcasting System bought a half interest and Judson became president of the new organization. "The consolidation of these bureaus," Judson said at that time, "is a logical step on the part of concert managers to provide better music and more music for the public. There is no question about the fact that the public at large is interested in fine music and what has now been done will go far toward meeting the popular desire to hear and see the world's best musical artists, as well as developing the necessary talent and in other respects encouraging the popular appreciation of music as an art."

With a larger service made possible by the greater influence of Columbia Concerts Corporation Judson was able, also in 1930, to grasp the opportunity offered by Community Concert Service to accomplish his ambition of bringing good music not only to cities but to small towns. In December 1927, Ward French, a mid-western concert manager, had established Community Concert Service to promote his plan for underwriting concerts by means of prepaid subscriptions in towns eager for good music but unable to assume the financial risk of engaging high-salaried artists and unwilling to accept just anyone who would take a low fee. Believing in the practicality of the idea, Judson invited French to join Columbia Concerts in return for financial backing. The offer was accepted, and Judson, making Community Concert Service a subsidiary of Columbia Concerts Corporation (with the same administrators and board of directors), advanced nearly a quarter of a million dollars to put into operation the system by which towns throughout America may hear good music. Today this system makes it possible for towns to select each season from Community's lists the finest artists obtainable with the money raised and to present them to a new music public in a program on which the selections and not the visiting performers are the stellar attractions. Incidentally, the revocation of censorship surrounding atomic bomb activities was necessary to explain to Judson the origin of one such audience in

Richland, Washington. The town, now revealed as one of the chief manufacturing centers for the bomb, had come to be considered "the mystery town in music circles, because Community Concerts Service . . . was baffled by the sudden mushrooming of a large, receptive, and discriminative audience, and because artists scheduled to perform there had to sign a sworn statement agreeing not to talk of anything they had heard or seen in Richland."

Because the plan was instituted to benefit small-town music lovers, Judson says he regards the money he advanced in 1930 as a loan not to the communities but collectively to his artist clients. It is the artists, therefore, who are gradually decreasing the debt by paying a 20 per cent commission to Columbia Concerts on each engagement. A 1945 estimate of the plan's success states that Community Concert Service "has brought to nearly 400 cities and towns in the United States and Canada [none of which had previously known successful concert seasons] series of concerts aggregating 1,500 yearly artist engagements." And Judson himself reports that the artists are satisfied with the arrangement because they are reaping the benefits of added engagements. Today Judson's Columbia Concerts Corporation has only one large rival, NBC Artists Service, with which, in the small community sphere, it does not compete, but shares the field.

During these years Judson was still manager of both the New York Philharmonic-Symphony Orchestra and the Philadelphia Orchestra. Having been associated with the former since the season of 1914-15, he was not to relinquish control until 1935, when he resigned as manager, declining, however, to satisfy the press as to the reasons for his action. He was to be connected with the Philharmonic until 1943. A five-year period as advisory manager of the Cincinnati Symphony Orchestra made him at one time active in the concerns of three orchestras in addition to his concert management and radio work. While with the Philadelphia Orchestra Judson founded the Robin Hood Dell Concerts, and had brought the New York Philharmonic to play at the popular priced summer concerts in Lewisohn Stadium. His latest project extends the Community Service arrangement, with more than a hundred concerts scheduled in its first season, to Latin America, and, "awaits only the end of the war to embrace the five continents in a democratic exchange of American and foreign artists and audiences."

The major function of Columbia Concerts Judson deems to be the awakening of public interest in good music, the discovery of talent to promote this interest, and the "widest and most effective" distribution of this talent to the concert halls and radio auditoriums of the nation. He declares that this viewpoint, far from modifying his standards for performers, has resulted in a stiffening of them. For a successful musical career he cites three basic qualifications: technical mastery and an increasing repertory, individuality of interpretation, and personality. Because it takes fortitude to face a series of public appearances, life in hotel rooms and nights on Pullmans, constant change of circumstance and surroundings, health, too, is an important consideration in Judson's estimate of a musician's possibilities. Relatively few musical amateurs meet his requirements, it is reported. Out of the thousands of candidates he interviews, he follows up only five or ten a year. For one thing, he says, too few people are willing to make an inventory of their assets as well as their desires. A "top genius," he maintains, comes along only after long and elaborate preparation. For instance, it took him ten years to make a public success of one musician whose talent he had recognized as worthy of promotion. Nor have critics much to do with an artist's success or failure, he adds, citing the example of Vladimir Horowitz's '43 New York debut, at which the critics were cool but the public clamored for more. Besides Horowitz, Judson has presented to American audiences for the first time José Iturbi '43, Bidu Sayao '42, John Barbirolli '40, Josef Szigeti '40, and others; and he has managed, among others, many of them personally, Jascha Heifetz '44, Lucrezia Bori, Nelson Eddy '43, Todd Duncan '42, Robert Casadesus '45, and Rudolph Serkin '40.

Judson, who holds an honorary Doctor of Music degree bestowed upon him in 1931 and who was elected an officer of the French Academy of Fine Arts in 1920, is an outdoor man as well as something of a scholar. He owns a summer place, Camp White Bear, on an island in Lake Timagami in northern Ontario, from which long canoe trips through the Canadian north woods are a favorite recreation. While he owns a home in the town of White Plains, New York, he is in 1945 landscaping a site for a future home in the neighboring town of Purchase, doing much of the manual work himself. But he is also an omnivorous reader, taking special interest in Elizabethan literature, and "his unique office with a high antique desk (at which he works standing up), with its steel engravings, comfortable chairs, shelves of books, antique furniture, and old pewter and Sheffield" reflects this side of his nature. Physically, he has been described as "a huge man, with a massive head, a rectangular, ruddy face, and great hands that have the strength of a lumberjack [he likes to chop wood] and the sensitivity of a violinist." On November 24, 1904, in Dayton he was married to Edna H. Bench, from whom he was subsequently divorced. His second marriage to Daphne Duquette of Montreal, Canada, took place in June 1941. He has one son, Francis Edward, by his first marriage.

KAHN, ELY JACQUES June 1, 1884-

Architect; designer

Address: b. 2 Park Ave., New York City; h. 970 Park Ave., New York City

The architect Ely Jacques Kahn is more than an architect of homes and buildings; he is a

ELY JACQUES KAHN

designer as well, for he feels that interior decoration is an essential part of architecture. He is interested in discovering new sources of design and function through a study of new materials and their adaptability to modern usage, and he urges that craft schools give students more of an opportunity to experiment with new forms.

Ely Jacques Kahn was born June 1, 1884, in New York, where he still lives. His parents were Eugenie (Maximilian) Kahn, and Jacques Kahn, a glass manufacturer who had come to America in 1868 from the Austrian Tyrol. Ely received his B.A. degree from Columbia University in 1903 at the age of nineteen, and a B.Arch. in 1907. Shortly afterward he went abroad, there to continue his architectural training in Paris. He studied painting and decoration as well, and in 1911 the young American won an award in painting given by the Salon des Artistes Français. The following year he was graduated from the Ecole des Beaux Arts with a diploma from the French Government and the Prix Labarre.

Young Kahn began his career by working for several years in the offices of well known architects in Paris and New York. For a part of this time, in 1915, he applied his knowledge to the teaching field, as professor of design at Cornell University. In 1917 he became a member of the firm of Buchman and Kahn, and twelve years later he established his own office. Concurrent and subsequent activities of Kahn's indicate that his interests have extended outside the immediate field of architecture, to interior decoration and to other forms of the industrial and decorative arts. From 1929 to 1934 he was on the staff of the Metropolitan Museum Committee for Decorative Art Exhibitions, and he has lectured at the museum on architecture. He is chairman of the advisory commission of the School of Industrial Design in New York and has been vice-president of the National Sculpture Society. In 1931 he was made director of the department of architecture of the Beaux Arts Institute of Design; the next year he was made chief of the section of industrial arts for the Chicago Centennial Fair of 1933.

Through his writing and his work Kahn became known for his concern with the future of American architecture and design. He felt that an artist must combine a sense of beauty with an appreciation of the functional aspects of art; he emphasized a consideration of new materials; and urged that designers break away from outmoded conventions and a reliance European forms. The standard of design among students was low, he observed in 1932. He attacked the trivial brilliancy of some "paper architecture," and said that modern architecture must be a rational interpretation of new problems—simple, direct, and honest.

In 1933 the New York architect was given a ten-thousand-dollar grant by the Carnegie Corporation to conduct an international survey of industrial art progress and to compare American methods with those of other countries. As a representative of the American Institute of Architects, he was charged with finding the answers to certain questions: Are American craft schools doing their jobs in line with the requirements of our mechanized civilization? Are the studios producing works in metal, glass, leather, and the like, imitating Europe or Colonial America, or are they really designing? Are museums the morgues of salvaged remnants, or are they stimulating the artist and the public with interestingly staged shows?

The search for the answers took the architect around the world from east to west through Hawaii, Japan, Korea, Manchuria, China, the Celebes, the Philippines, Bali, Java, Singapore, the Straits Settlements, Indo-China, Cambodia, Siam, Burma, India, Ceylon, Egypt, Italy and the rest of Europe, and then schools, factories, and shops in the United States. The results are in *Design in Art and Industry* published in 1935. Kahn, the book revealed, was dissatisfied with American craft schools. He saw in them an academic inertia which he had not found in the Orient. American schools, he declared were not keeping up with the increasingly wide range of materials. Students were taught traditional designs and experimented too little with new forms. He had been able to find little genuine originality, little freedom from outworn styles—a condition which he felt was better under the apprentice system in Asia and Europe. The public, however, was becoming aware of the uses of glass, plastics, and rayon fabrics as a result of large exhibitions.

American architectural schools, Kahn wrote then, were guilty of imparting too much derivative theory, which did nothing to help put the student in contact with the great demand for industrial designers. Technical schools, on the other hand, tended to concentrate on machine technique and to encourage copying old patterns instead of originating new designs. Students in America, he said, must have more practical experience. The architect must be a designer as well, and must work in fields of general design; he must try to improve public taste, to establish high principles and live up to them. He must have a knowledge of how design develops from raw materials. The public, in turn, must demand function and beauty in its buildings and in everything that is in them. Only by ridding itself of its present apathy can America expect to develop an art that is distinctive, vital, functional, and beautiful in the highest sense, and peculiarly her own.

"Design," Kahn has written, "is the basic element of all intellectual processes: music, drama, painting, architecture, mathematics, and engineering or science . . . an idea is a skeleton, the dynamic statement of which depends on amplification by a system of coordinated elements. This process of development is termed design." He sees buildings as units with carefully integrated parts. Architecture, he feels, unquestionably involves interior decoration. As a designer himself, Kahn is found by critics to be resourceful, striving always to express the essential character of his materials and to combine them for richness of texture and rhythm. He repeatedly urges decorators to study and make use of all available materials. His own interiors reveal an elaborate interplay of wood, glass, metal, stone, fabrics, tiling, and whatever else he chooses to include. The use of the grain in woods and the use of color, too, often play an important part in his interiors. In the homes he designs he attempts to eliminate waste space, to have as little complexity as possible. In designing office buildings he works on the principle that they must fulfill their intended purpose and be sound financial projects. He makes the most of lighting possibilities, and has advised whenever feasible the use of parking lots on either side of an office building to take advantage of the additional light and air—a plan which he feels would bring higher rents for otherwise dim bottom floors. For New York Kahn has designed such familiar buildings as the Jay Thorpe and Bonwit Teller stores, International Telephone and Telegraph, the Hospital for Joint Diseases, the Yardley Shop at Rockefeller Center, the Squibb Building, and the Continental Building. For the New York World's Fair he designed the Marine Building and the Ballantine Restaurant.

Aside from his book, the architect has written articles for *The Encyclopædia Britannica* and for several magazines, some of them outside the field of art and architecture. In 1928 and again in 1931 he wrote of the importance of coincident financing and planning. He stressed, too, the need for flexibility of plan in designing a new building. In a letter to the *New Republic* in 1931 he tried to arouse the New York public to investigate five aspects of a broad architectural program: housing, freight, traffic, park and playground, parking and vehicles. His writing, it is said, is characterized by rare energy, imagination, and sound judgment. He foresees problems and solutions which the public is sometimes slow to recognize. In 1935 Arthur Tappan North wrote of Kahn, "It is interesting to note the dates attached to the excerpts from the writings of Ely Jacques Kahn and relate them to the then current ideas and practices. Many of his ideas, as then expressed, are now accepted as correct and for that reason are a part of the true record of architectural developments." "Experiment is the soul of a civilized being," Kahn had said in 1930. (He does believe, however, that a genuine interest in archaic forms can help in the realization of natural artistic qualities.)

The architect has been president of the Peter Minuit Corporation, treasurer of Eray Securities Corporation, director of the Park Place Corporation, chairman of the board of the Beaux Arts Institute of Design, member of the Architectural League of New York, the Bund Deutschen Architekten of Berlin, and the Société des Architectes Diplômes par le Gouvernment Français, and Fellow of the A.I.A., and he was president of the Municipal Art Society (1942-45).

At present Kahn is an architect for Government housing projects. His interests range from the minutiae of decoration to Persian pottery, carpets, indirect lighting, comprehensive city planning, and the economics of skyscrapers, and he reads widely in English, French, and German literature. He is described as amiable and tolerant of the views of others, forthright and unaffected. He was married to Beatrice Sulzberger in November 1939. (His first wife, to whom he was married in 1913, was Elsie Plaut.) He has three children, Ely Jacques, Olivia, and Joan Plaut. His non-architectural memberships include the Sunningdale Country Club, the Iranian Institute, and the American Association for the Advancement of Science.

KECK, GEORGE FRED May 17, 1895- Architect

Address: b. 612 N. Michigan Ave., Chicago; h. 5551 University Ave., Chicago

"The solar house can be counted on as a common denominator" in postwar home construction. Such is the considered opinion of three men who "have probably looked at more house plans than any other trio in the United

Hedrich-Blessing Studio

GEORGE FRED KECK

States," the editors of *Architectural Forum, Architectural Record,* and *Pencil Points.* Among the leaders of this development is George Fred Keck, the creator of the original solar house, today rated among the top ten architects in the United States, whose work for many years has been the planning of homes orientated to the climate on solar principles and to the occupants from the point of view of sociological data.

George Fred Keck, whose prenames are the reverse of those of his father, Fred George Keck, was born in Watertown, Wisconsin, on May 17, 1895. His mother, Amalia (Henze) Keck, besides raising a large family, found time to paint, and to teach him something of that art before he was ten years old. The boy, who was also handy with tools, was already adept at drawing, but it was not until a number of years later that he decided to become an architect. In the meantime, he attended elementary and high school in Watertown. When he enrolled at the University of Wisconsin he chose a civil engineering course because he was still undecided as to his career. A year later, however, having made up his mind, he transferred to the University of Illinois because Wisconsin had no school of architecture. When the United States entered the First World War, Keck became a lieutenant in the Coast Artillery and served a year in France. Returning to the University of Illinois afterward, he received his B.S. in architectural engineering in 1920.

Until 1922 young Keck worked for William Pruyn and then for D. H. Burnham, Chicago architects. During the academic year 1923-24 he taught architectural design at his alma mater, the University of Illinois. For the remainder of 1924 he and Mrs. Keck toured England, studying its architecture. Upon the Kecks' return to America the architect joined the firm of Schmidt, Garden and Ernesen of Chicago.

In 1926 Keck established his own architectural office, and he dates from this year the dominant feature of his work—the application to home architecture of the newest ideas and inventions in building and decorating materials to produce a more livable house. "An out-and-out modernist"—as the *Architectural Forum* characterizes him—Keck says, "Get rid of emotion and tradition and get to the facts and needs of contemporary construction, and you get good results." For the most part Keck has specialized in single-family dwellings, although he has designed apartment houses and commercial buildings. While most of these were custom-built, shortly before the war he was the principal architect of a group of thirty solar homes in Glenview, Illinois, built by a Chicago firm on a built-for-sale basis. Recently he has designed prefabricated solar homes for erection by Green's Ready-Built Homes of Rockford, Illinois. He has also acted as consultant to manufacturers in the development of new building materials, and from 1940 to 1944 he was head of the department of architecture of the Chicago School of Design.

Keck's rise to prominence is connected with the Chicago Century of Progress Fair of 1933-34 for two reasons: he was the architect of the House of Tomorrow and of the Crystal House; and it was there that he discovered the solar principle with which his name has since been linked. Because the House of Tomorrow was an exhibition house—"designed to demonstrate mechanical equipment and new building materials that are now on the market," a descriptive Chicago Fair brochure states—"the chief concern of the architect was not to give a specific form to his building, but rather to find a solution to the many and varied new requirements of a residence in a simple and direct manner." The solution was entirely functional and thoroughly modern. Keck built the house literally as well as conceptually around an air conditioning system which made glass walls possible by eliminating the need for window ventilation and which, together with utility rooms, heating facilities, and the stairway, was placed in the central portion. The unusual duodecagonal shape, to quote the brochure again, "resulted from the number and sizes of the rooms required on the different floors and from the fact that the glass walls on each of these twelve sides would be of a size that could be installed efficiently." And the use of glass on all outside walls was made possible by employing "store-front construction and a steel frame to carry floor and roof loads." In the Crystal House this steel and glass construction was carried out on a rectangular frame.

Keck's discovery of the solar principle was an accident: One very cold day during the construction of the House of Tomorrow, Keck arrived at the scene to find the workmen indoors—behind the glass walls—in shirt sleeves and perspiring, although the furnace had been turned off for hours. Realizing the importance of what he saw to housing improvement, Keck thereupon set out to capture solar heat for architectural purposes. Consultation with the local weather bureau gave him the answer: overhanging roof construction—mathematically calculated in relation to the inclination of the sun's beams throughout the year—which extends far enough to shade the house from the almost direct rays of the summer sun high in the heavens but not far enough to prevent the slanting rays of the winter sun from striking the windows beneath. To obtain maximum benefit, the house is orientated in the direction of the source of sunlight. Living areas of the solar house always face south, and the southern walls, almost entirely of glass, are made of thermopane, "the double plate glass pane with a metal-sealed dehydrated air space [an insulation against cold] in between." "Adjacent panels of adjustable louvers that claim the advantage of admitting air while keeping out the elements" provide the necessary ventilation. Service units (kitchen, pantry, etc.) are then placed on the north side of the house and furnished only with small windows so that they may serve as buffers against cold and storm. For added coolness in summer the roof is of flat construction and covered with a thin sheet of water in order to utilize the natural process of cooling, evaporation. Artificial winter heat is provided by conduits imbedded in the floor and walls. The results of this construction are better lighting and comfortable temperatures all year round, and a saving in fuel and light bills.

Design of the houses is extremely flexible. Keck has built solar houses in rectangular, crescent, or asymmetric shape, has used flat roof construction of one or several levels, and has solved the problem of privacy by careful orientation on the lot combined with the use of hedges and gardens or by the location of the north façade of the dwelling on the street side. His materials have been wood, glass and stone or brick for the exterior and a variety of new products, some soundproofed, for the interior. Some houses have been prefabricated. The houses themselves he designs around a basic unit, composed of a work area, a rest area, and a play area, generally of equal size, to correspond to the three divisions of the normal day. Living quarters may be increased in size at any time by the addition of transitional rooms or areas which are usually designed to be easily converted, for example, from nursery to study or for other use. Sliding walls between rooms supply additional flexibility.

Keck proceeds from the assumption that each individual is entitled to privacy and from the sociologic tenets that adults have fixed habits, that children today have more independence than formerly, that adolescents need space in which to entertain, that college students and young married couples often live with their families. To this architect, sociological and psychological considerations are as important in planning and improving housing as are mechanical considerations. "Biologically, the family unit does not change," he says. "But we Americans have progressed least up to now in our ability to provide proper living quarters for the family unit. The loose talk one hears about the disintegration of family life can quite properly be laid to the fact that our houses do not fit today's living conditions, and because they do not fit, there is a tendency to get away from them upon any provocation, and unless they soon begin to fit, disintegration will indeed occur. . . .More and more, the invention of accessories to the house more firmly establish the single-family unit; improvements in transportation, radio, television, airplane, all make it possible to bring the world and its goings-on to the house wherever it is situated. All we have to do is design the house to take it."

Keck is six feet tall, weighs one hundred and sixty-eight pounds, and has brown eyes and graying hair. He still likes to paint, in water colors. In November 1921 he was married to Lucile S. Liebermann, whose family had lived across the street from his in Watertown. Mrs. Keck since 1932 has been librarian of the Joint Reference Library in Chicago. The Kecks now live in that city, in a house illustrating the architect's planning principles.

KELLY, GENE Aug. 23, 1912- Dancer; actor, choregrapher

Address: b. c/o Metro-Goldwyn-Mayer, Culver City, Calif.

An immediate hit in his first movie role in 1942, Gene Kelly has received critical approval since then as a choregrapher, a dramatic actor, and a singer. But he usually is identified as a dancer "just a bit better than anyone else": Bob Hope '41 has quipped, "Every time Gene Kelly dances, Fred Astaire '45 starts counting his money."

Born in Pittsburgh, Pennsylvania, on August 23, 1912, Eugene Joseph Kelly is one of five children of Catholic parents. His Canadian-born father, James Patrick Kelly, was an executive with the Columbia Gramaphone Company; his mother, Harriet Kelly, had been on the stage as a young girl and after her marriage had continued her theatrical career with a Pittsburgh stock company. As a child Gene was sent to dancing school, much to his boyish chagrin. He attended St. Raphael's grammar school and Peabody High School, where he was a star halfback and played on the basketball and hockey teams. While in high school he also continued his dancing lessons and acted in school plays.

After his graduation from Peabody he entered Pennsylvania State College, but when the depression affected the family finances the student returned home. He found a job teaching gymnastics at Camp Porter, a YMCA camp near Pittsburgh. The following year he resumed his education, this time at the University of Pittsburgh, where he majored in journalism. Working his way through college for Kelly meant taking jobs as ditchdigger, concrete mixer, and carpenter's helper. Meanwhile, he continued to practice dance steps with his two brothers and two sisters. When brother Fred discovered that they could obtain engagements dancing in near-by night clubs, he and Gene turned to entertaining. "We made up a couple of jokes, stole a lot more, and paired up

GENE KELLY

as a team," Kelly says. Besides cafe appearances, the Kelly brothers won many amateur contests and thus helped to sustain the family income in the lean depression years.

Kelly's theatrical talent was well known on the university campus, for the student took part in the annual Cap and Gown shows, directing the production in his senior year. When his college friends became interested in his dancing, he offered to teach his terpsichorean art for fifty cents an hour. Soon the Kelly cellar was turned into a dancing school, and when that became crowded the family rented a hall and opened the Gene Kelly Studios of the Dance. (Meanwhile, Kelly was graduated from the university in 1933.) Directed by Mrs. Kelly, the dancing school was so successful that a second one was opened in Johnstown, where Kelly also taught tap and ballet. During the summers the instructor went to Chicago to attend the meetings of the Dancing Masters Association. In Chicago Kelly studied the dance, and now claims to have read every book on the ballet in the Chicago Public Library—including those in French. When his funds became low after such trips he took night club jobs, dancing and performing what he describes as "a beautifully corny master-of-ceremonies act." The Kelly schools made profits, but in a few years their owner decided to seek greener pastures in New York.

Leaving the schools in charge of his family, Kelly tried Broadway in 1938 and quickly won a small dancing part in *Leave It to Me,* in which Mary Martin '44 blossomed out with "My Heart Belongs to Daddy." Then followed a dancing and singing role in the Nancy Hamilton show *One for the Money,* which opened in February 1939. After a season of summer stock at Westport, Connecticut, Kelly won a dancing and acting part in the Theatre Guild-Eddie Dowling production of William Saroyan's '40 *The Time of Your Life.* The Pulitzer prize-winning play, for which Kelly staged his own dances, opened in the fall of 1939 and ran for twenty-two weeks. Then came another period in summer stock before Kelly became dance director for Billy Rose's '40 Diamond Horseshoe. There he met Betsy Blair, a young chorus girl, to whom he was married, on September 22, 1941. (The Kellys now have a daughter, Kerry.)

Kelly's big chance in the theater came in late 1940, when he opened in the title role of *Pal Joey,* George Abbott's '40 production of the John O'Hara '41 stories. Playing opposite Vivienne Segal as the "heel-hero" of the musical comedy, Kelly says this part received laudatory criticisms. In a column devoted to a discussion of "Pal Kelly," John Martin (New York *Times,* June 8, 1941) wrote that in the play dancing and character were "far more closely united than in the majority of ballets." Martin pronounced the young leading man's work exceptional: "He is not only glib-footed, but he has a feeling for comment and content that both give his dancing personal distinction and raises it several notches as a theater art." That critic correctly predicted a Hollywood summons for the Broadwayite. But before he went west, Kelly turned to dance direction again, for another Abbott production, *Best Foot Forward,* which opened in October 1941. An outstanding musical success of that season, the show received good notices and Kelly's dance routines were commended. Meanwhile, the actor had been signed for films by David O. Selznick '41 as a result of his performance in *Pal Joey.* Thus he and Mrs. Kelly headed for California by way of Mexico, but once in the film capital, they found that Kelly's contract had been sold to MGM.

Kelly made his film debut in *For Me and My Gal* (1942) with Judy Garland '41 and George Murphy, in a role reminiscent of *Pal Joey.* According to *Newsweek,* he "progresses from heel to hero with a persuasiveness that scores a scoop for MGM's talent scouts." But Bosley Crowther in the New York *Times* declared that Kelly had been "pressed a bit too far in his first film role." Determined to avoid being typed as a dancer in motion pictures, Kelly next played a smaller dramatic part in *Pilot Number Five* (1943). This was followed by two musicals, *Du Barry Was a Lady* (1943) and *Thousands Cheer* (1943). His next picture again offered Kelly a dramatic role, as a Parisian taxi driver in *The Cross of Lorraine* (1943). Dealing with the tragedy of war prisoners under the Nazis, the film was well received and Kelly's performance was considered "moving."

Columbia Pictures then borrowed him for their Technicolor spectacle *Cover Girl* (1944), co-starring Rita Hayworth, for which Kelly devised his own dances. Termed by *Time* Magazine "the best cinemusical the year had produced, and one of the best in years," *Cover Girl* won high praise for Kelly. "Few cinemactors can match his reticence, exact evocativeness, and sincerity, or carry such acting abilities into dancing and singing," said one critic. Singled out for special attention was the "alter ego" dance. A New York *Herald Tribune* writer declared, "The human race has been having trouble with its conscience since time immemorial. It remained for Gene Kelly, however, to get his still, small voice out into the open and—dance with it." Equally enthusiastic was the *Times* critic, who said that "for once a dance on the screen is not merely a specialty but actually develops character and advances plot." This dance with his shadow, used by Kelly to express a mental struggle, entailed numerous technical difficulties in sound, photography, and timing, for the two Kellys threaten each other, pursue each other up and down a flight of stairs, leap over each other's heads—all in perfect rhythm and synchronization. Labeled "a psychic tour de force," it drew the following comment from the *Hollywood Reporter*: "Nothing finer in the way of a dance routine has ever been filmed."

Kelly was again cast in a dramatic role in *Christmas Holiday,* his next screen vehicle, an adaptation of Somerset Maugham's novel. The film was not too well received, and estimates of Kelly's performance varied. As Deanna Durbin's '41 reprobate husband, he "never ventures a tap," which vexed John T. McManus of *PM,* while the *Times*'s Crowther commented on Kelly's "breezy, attractive style, which is thoroughly confusing, considering the character that he is supposed to be." However, Alton Cook wrote in the New York *World-Telegram* that Kelly performed "superbly," while in the New York *Sun* Eileen Creelman complained that Kelly's part was "much too small." With Frank Sinatra '43 and Kathryn Grayson, Kelly next starred in the hit musical *Anchors Aweigh* (1944), for which he was also dance director. Cast as a sailor in the Technicolor romantic comedy, he tangoed with the leading lady, did a Mexican number with a seven-year-old child, a sailor routine with Sinatra, danced with an animated cartoon figure, and had a solo Spanish dance. His dancing, comedy talent, and even his singing were praised, and to one critic his performance was "an absolute climax to the brilliant start he had made on a career of dancing for the movies."

After seven months in the sailor role on the MGM lot Kelly entered the Navy in November 1944, taking his basic training in San Diego. A lieutenant (junior grade), near the end of 1945 he was stationed in Washington, D.C., in the Naval Photographic Science Laboratory. According to Kyle Crichton in *Collier's* (May 19, 1945), Kelly "has plans for revolutionizing dance treatments in the films" upon his return to Hollywood, and can experiment with them under his three-way contract as actor, director, and producer. For the forthcoming film *Ziegfeld Follies,* completed in 1945, Kelly danced for the first time with Fred Astaire. Their number is a double tap sequence to George and Ira Gershwin's "The Babbitt and the Bromide," written originally for Astaire and his sister Adele in *Funny Face.*

The dancing star has made several radio appearances, on the Frank Sinatra and Bing Crosby '41 programs. Known as a friendly, fun-loving person, Kelly is said to have "an American baseball personality." The brown-eyed, black-haired actor is five feet nine inches tall and weighs one hundred and fifty pounds. As evidenced by the many books in his home, Kelly's reading taste runs to modern biography, history, and economics. He is interested in politics and government and actively supported Franklin D. Roosevelt '42 in the 1944 campaign. A member of the wartime Hollywood Victory Committee, Kelly reported on the need for regular hospital entertainment (after a pioneering Army hospital tour) and thus stimulated the organization of such a unit. In his concern for economic security for all, tolerance, and racial understanding, Gene Kelly believes that the actor should play his part as a citizen as well as a performer.

KELLY, JOE May 31, 1901- Radio entertainer and script writer

Address: b. c/o Louis G. Cowan & Co., 8 S. Michigan Ave., Chicago; h. 4945 Washington Blvd., Chicago

Joe Kelly, quiz master of the *Quiz Kids* radio program since June 1940, is one of the most publicized members of the radio profession. Unlike others in the field, Kelly has risen to his present position not because of any formal educational qualifications, but because of his cheerful disposition, tact, and alertness in his conducting of the quiz program. According to Kelly, who started from "scratch," he now has twenty million listeners "waiting for him to go out on a limb and cut it off after him." To be sure, he has all the answers written on cards, but, as John Lear wrote in the *Saturday Evening Post,* "Few men since Solomon have braved so many confusions of the human mind. . . .Solomon had time to think. . . .Joe has to call them while they are still in the air. . . .He must say 'Right' or 'Wrong' before the next clock tick."

By birth, Joseph William Kelly is a Hoosier—he was born in Crawfordsville, Indiana, on May 31, 1901. His father, William Joseph Kelly, a brewery truck driver, died when eight-year-old Joe was about to enter the fourth grade at school. His mother, May Henrietta (Kepler) Kelly, an amateur poetess, was left without adequate means and was obliged to turn her son's fine soprano to the aid of the family exchequer. Joe was only six when he had won an amateur contest in an Indianapolis theater; then, at the age of eight he was engaged to sing for three dollars a night in the Crawfordsville Music Hall. It proved a windfall for the Kelly family when shortly afterward Edward Doyle, a leading stock-company manager, offered him fifty dollars a week as a featured member of his show. Joe quit school at once and joined the Doyle show at Huntington, Indiana, billed as "Master Joe Kelly, the Irish Nightingale."

The boy lived in dingy small-town hotels for the next three years, "with no one to comb his hair or patch his pants. But he made his own money—barrels of it, for a kid." He learned practical arithmetic by paying his hotel bills, acquired an ability to express himself by writing letters home to his mother, and, with the aid of a ten-cent-store dictionary, read stories of Horatio Alger boys, such as *Tom, the Bootblack, or, a Western Boy's Success;* and *Jed, the Poorhouse Boy, or, From Poverty to Title.* One day, Kelly says, he received word while on tour that his mother

C. M. Frank Studio

JOE KELLY

was dying. He hurried home, arriving in time to sing for her in the blue and white suit he wore in the show.

Joe arrived at the peak of his youthful singing career when, at the age of eleven, he left the Doyle show to join Neil O'Brien's minstrels at seventy-five dollars a week. He was advertised as the youngest minstrel in America, and had a sixteen-piece orchestra to support him, while, arrayed in a splendid purple satin suit, he lilted popular melodies. One woeful day two years later the boy's soprano broke suddenly in the middle of high C. It was then that he stepped from the world of footlights into the humdrum of everyday life, becoming an office boy in Indianapolis for the Singer Sewing Machine Company. The change was disconcerting, for although O'Brien's minstrels had some of the most famous names on its payroll—Lasses White, Bert Swor, Black-Face Eddie Ross, and Carol Norman, the Creole Fashion Plate—it was Joe who rode in the daily parade in a carriage drawn by two white horses, while everyone else in the company walked.

But young Kelly, it appears, was not the sort of person to become easily discouraged. Before long he was utilizing his noon hours to absorb some knowledge of piano playing. At the "five-and-ten" he listened to popular numbers being played in the sheet-music department. Thus inspired, although he couldn't read a note of music, he organized his own dance band, which he named Kelly's Klowns, and proceeded to conduct with evident success. At the age of seventeen he returned to the stage with the John D. Winninger Players, and later joined the Rex Players, an English troupe playing permanent stock in Kingston, Ontario. It was there that he fell in love with pretty Mary James (secretary of the Rex Company's office), to whom he was married on St. Patrick's Day, 1923, with the promise that he would quit show business forever.

When the Kellys arrived in Benton Harbor, Michigan, Lear relates, they had only thirty cents between them. As the mainspring of Kelly's life was music, it was not surprising, after they had pawned Joe's saxaphone and a ring of Mary's to set up housekeeping, that he first tried selling pianos and Victrolas. This did not develop into a very remunerative undertaking, for it was only in the evening that he could call on the farmers in the neighborhood. This meant stumbling about in the dark, encountering watch dogs and, on one occasion, a shotgun. Furthermore, writes Lear, "after the farmers heard him play their old pianos, they didn't think new ones could be half as good." In his final efforts to keep his promise to his wife, Kelly ran a railroad warehouse, managed a men's clothing store, and played with a dance orchestra in the evenings.

The radio career that led to the *National Barn Dance* and the *Quiz Kids* had its small beginnings some years ago when Kelly teamed up with Jack Holden in a comedy singing act, *The Two Lunatics of the Air*, broadcasting from Battle Creek, Michigan. They received twelve dollars a week, plus all the milk they could drink, from the sponsoring dairy company for six thirty-minute shows a week. Four years later Kelly left the act to join the announcing staff of Chicago's WLS, from which he was subsequently chosen for the role of master of ceremonies for *The National Barn Dance*, a position he has held since that time.

Kelly's much-discussed connection with the juvenile counterpart of *Information Please* began in June 1940. Because of his even disposition and down-to-childhood point of view, he was chosen in preference to any of the twenty-four college professors, news commentators, and quiz experts who had been auditioned. "The youngsters simply 'froze' with everybody else," explained Louis G. Cowan, owner of the *Quiz Kids* program. Kelly is fond of children (he has a son of his own, Joe, Jr., now in the Army), and his admiration for the Kids is returned by them. His motto is "Treat children as equals and never talk down to them." *PM* says a radio cynic once observed that "the Kids would drive Joe either to drink or encyclopedias." It is recorded that the children had the latter salutary effect—he now has several sets of the reference works in his Chicago apartment.

In his association with his juvenile phenomena Kelly has always been polite, although the effort it takes on occasion is said to cause him moments of acute nervous strain. According to *Cue*, "he was even polite the time one boy, asked to sing 'Three Little Fishes,' swam over the dam and downstream for five minutes, and nothing could stop him." His easy laugh and casual jokes often conceal tense moments, as *Cue* has indicated in the following *Quiz Kid* incident:

"The question was: 'Define, respectively, a dodo, a dido, and a dado.' Eight-year-old Gerald Darrow answered confidently, 'A dodo is a prehistoric bird,' and added by way of color, 'I think he has a harsh call.'

"So Mr. Kelly said, 'I don't know about the dodo's harsh call, but otherwise you are O.K.'

"'Not exactly,' protested thirteen-year-old Van Dyke Tiers. 'The dodo is extinct but not prehistoric.'

"'Well,' Mr. Kelly drawled, stalling for time and hunting frantically through his notes. 'I guess there isn't much difference, eh?'

"'Mr. Kelly,' Van Dyke announced firmly, 'I would like to submit to you that all prehistoric animals are extinct, but all extinct animals are not necessarily prehistoric.'"

There was a moment in one of his opening broadcasts with the Quiz Kids that Joe Kelly will not easily forget. It was the day when he asked the question, "Whom might you expect to find on the master's end of the leash if you say each of the following three dogs?"—and then forgot the names of the dogs. There was friction in the studio later that night, and Kelly, who had never been "tossed out of a job in his life," thought that "this was it." But the sponsor of the show said "No" to all negative opinions, declaring that Kelly was at least human with the Kids. The result was that a research staff was hired to dig up all possible answers to future questions; this information was indexed on a set of cards which Kelly could take home with him on Saturdays to study. As a precaution against further endangering his pride and personal dignity, he bought an unabridged *Webster's International Dictionary.* With the help of that, together with his prodigious memory, he is said to have no more trouble in getting the answers down pat.

Working under pressure has proved beneficial to Kelly, for it is said that today in conversation he betrays no sign of limited education. According to Lear, he earns approximately six hundred dollars a week. Like many other untrained musicians, he has written several songs—*Kelly Blues, Lonesome and Grieving, Dear Little Girl, Gold Star Mother o' Mine, Just Ask the Quiz Kids, Jolly Joe's Official Birthday Song,* and *Hats Off to Old Glory.* In addition, he has done a cartoon strip, *Jolly Joe's Pet Pals,* and is a radio script writer. His screen appearances include one full-length feature, *The National Barn Dance* and six short subjects for Paramount, and one short subject with the Kids for the United States Department of Agriculture. He has a citation from the United States Treasury Department for his efforts on behalf of the National Defense Saving Program, and he is the possessor of a Merit Medal from Veterans of Foreign Wars.

Joe Kelly has an optimistic and effervescent personality. He is described as a plump and jolly five-foot-seven-and-a-half, weighing one hundred and seventy-five pounds. His eyes and hair are brown. He is a natty dresser, and his hobbies are collecting autographed photographs of famous people, swimming, golfing, and window shopping. He relishes making "involved" sandwiches and declares that some day he is going to open a chain of sandwich shops.

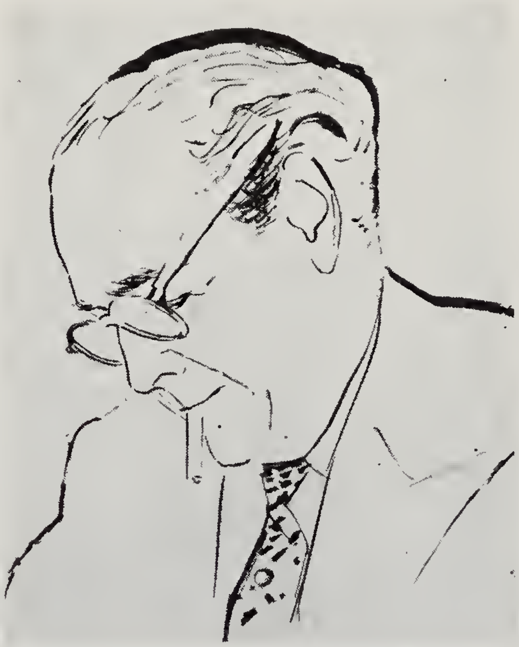
KIAM, OMAR (kī'ăm) 1894- Fashion designer

Address: b. c/o Ben Reig Company, 498 Seventh Ave., New York City; h. Hotel Plaza, New York City

"One of the most distinguished designers in the wholesale field," Omar Kiam of New York creates what he calls "distinctive clothes for the woman who would rather be smart than pretty." His dresses, some of which retail for hundreds of dollars apiece, are noted for their subtle details, and are designed to be worn for at least three years. Despite his use of fur and "fabulously rich" materials and trimmings, he holds that the most beautiful dress can be no more than a background for jewels, furs, and accessories, and that it is the ensembling which determines chic.



Drawing by Plucer

OMAR KIAM

Born in 1894 in Monterrey, Mexico, Omar Kiam is the son of Alexander and Sarah (Block) Kiam, who gave him the name of Alexander. His parents, Alsatians by descent and Americans by citizenship, operated a hotel in the Mexican state of Nuevo León. After the death of his mother young Alexander went to live with his grandmother in Houston, Texas, where he began his elementary schooling. He then went East to attend the Riverview Military Academy, a preparatory school in Poughkeepsie, New York. It was here that his given

KIAM, OMAR—*Continued*

name was changed to Omar by his classmates when they studied *The Rubáiyát.*

At the age of eighteen Omar decided that he preferred a chance in the business world to years at college. Having a liking for the theater, he tried to get a position in some phase of theatrical work, but his lack of experience and his immediate need for money forced him to look elsewhere. He compromised by taking a job with a St. Louis millinery firm as a ten-dollar-a-week stock-boy in the baby-cap department. At first young Omar was very unhappy at his work, but he soon discovered the wire-frame hat department next to his own. As a result he spent his leisure moments decorating the frames with ribbons, bows, flowers, straw—all attached at what he considered artistic angles. The company manager was so much impressed with the aspiring designer's talent that he transferred the young man to the pattern department. Shortly thereafter (before the First World War) Kiam became "bored with bonnets," resigned his position, and went to New York City.

Omar Kiam's first job in the metropolis was as a raw skin sorter with Julius Klugman Sons, Inc., a retail fur company. "The work was so smelly," Kiam told a *World-Telegram* reporter, "that I begged for an errand boy's job and finally was given one." The firm was a conservative one, making coats from stock patterns only, and not accepting orders for original designs. One day Kiam stopped a disappointed customer and whispered to her that he would make up the canvas pattern in the style desired. The lady was pleased with the design, and the company thought well of the skill displayed in making it. This was the beginning of Omar Kiam's career in the designing field. Within a short time he was creating suits, gowns, and ensembles, as well as fur coats. During a seasonal slump in business, when women were storing their furs for the summer, he originated the summer fur vogue by putting silver fox on chiffon. When Kiam left this company to open a dress shop under his own name, he owned half of the firm, which by that in time had gone into the wholesale fur business

When Omar Kiam "originals" became nationally known, the designer accepted Samuel Goldwyn's '44 invitation to work in Hollywood for United Artists Pictures. According to *Life* Magazine, Kiam created "lavish fur fashions and extravagant dresses" for the motion picture actresses. The designer went to the movie colony in 1935 with the expectation of remaining only a few months, but his designs received so much attention that he remained for five years. His clothes were worn by Janet Gaynor, appearing as a glamorous star for the first time is *A Star is Born* (1937), Loretta Young in *Call of the Wild* (1935), Ruth Chatterton in *Dodsworth* (1937), and Merle Oberon '41 in *Wuthering Heights* (1939). Other cinema favorites gowned by Kiam were Dorothy Lamour, Ann Sothern, Virginia Bruce, and Miriam Hopkins. The designer's talents, however, did not center upon women's clothing—he also won notice by his original "period" costumes in *Clive of India* (1935) and for his draping of Gary Cooper '41 in the *Adventures of Marco Polo* (1938). Although the designer's main purpose was to suit the physical characteristics and the role of the player he was dressing, and to give special attention to the photographic effects of the colors and fabrics, it was not unusual for women to buy duplicates of these gowns for their personal wardrobes. While in Hollywood several of Kiam's designs were adapted for the popular market: the fur-lined coats which appeared in *Clive of India* are still used for spectator sports; the strapless evening gown designed for Virginia Bruce started the exposed shoulder fad for debutantes; and Cathy's wedding gown in *Wuthering Heights* appeared in the window of an upper Fifth Avenue store and was copied by several manufacturers.

In 1941 Omar Kiam was brought back to New York City to be the chief designer of the Ben Reig Corporation, a wholesale dress manufacturing establishment. Here Kiam creates garments which are neat, but dressy, and employs such transparent fabrics as chiffon or lace to make them rich without distracting from their simplicity. What he calls "cord eyelet" has often been regarded as one of the most important contributions to style within the past few years. "Fashions," the designer has said, "are born of necessity." The cord eyelet was developed during the Second World War when laces were unobtainable for dress trimmings. The designer then proceeded to combine several soft fabrics twisted or wound into a lace lattice work which could be placed on the yoke, peplum, skirt, or sleeves of dresses.

Kiam is happier working in the wholesale dress field in New York than he was when he designed for the Hollywood producers because, he says, "I prefer to and find it more interesting to design for a great many women than just a few." His method for creating a new dress is to drape the fabric on a model who stands before a mirror while an artist sketches it. Kiam then steps back, removes his tortoise shell glasses, and observes the effect.

Kiam, who is a stanch champion of American fashion, was one New York City designer to be disturbed when the WPB set forth L-85 regulation for saving fabrics during the war. He told a New York *Times* reporter that the new curb was drastic and would result in standardized clothing. "It's going to take a good deal of ingenuity to make clothes look unregimented," he said. In the fall of 1945, when the government decided to continue the wartime regulation, Kiam held that there was a "fifth column in fashion" which was trying to defeat the New York style and fashion leadership. "Paris," he said, "had no restriction on fabrics and no price controls. All we ask is to be permitted to go ahead on parallel lines with Paris. . .to silence those tongues that say we have no fashion initiative."

Kiam, who believes that "women dress for women," follows the theory that clothing should have simple lines and elaborate details. He and Elizabeth Hawes '40, American designer, author of *Fashion is Spinach,* once had a dispute on this subject. Omar Kiam declared: "The finer points of dress are for other women; the general effect of the whole ensemble is for men." He feels that women choose tailored dresses because of the hand-sewn seams and hem, feather-stitched button holes—details which only women will notice. On the other hand, Miss Hawes, who uses rich fabrics and unusual colors, stated: "Women dress for men.

In primitive days the primary motive in dressing was for decoration—to attract the opposite sex. . . .Passing centuries have changed the situation only slightly. . . .If a woman dresses to attract the attention of other women, she's only doing that to take away the other woman's man."

The designer has received several awards and honors: the Nieman-Marcus award in 1942; "one of the leading designers" selected by *Life* in 1944; and inclusion on the Al Rosenthal Honor List in 1945. He has had two exhibitions in the Metropolitan Museum of Art in New York, in 1941 and 1945. His designs have appeared with articles at various times in *Vogue, Harper's Bazaar, Photoplay,* the New York *Times,* and several other magazines and newspapers. In the thirties Kiam designed the costumes of the actresses Lynn Fontanne '41 and Ina Claire, and created the gowns for the two famous "dinner" plays, *Dinner at Eight* (1932) and *The Man Who Came to Dinner* (1939).

Bachelor Omar Kiam is six feet tall and massively built. He has hazel eyes, and his brown hair is receding slightly. His two main hobbies are interior decorating and antique furniture collecting. Although Kiam seems to be unconcerned about his own wardrobe, he was chosen by Custom Tailors of America as one of the best-dressed men in 1940. His usual outfit consists of a conservative pin-striped suit, one-color tie, and a blue or white shirt.

KIRK, ALEXANDER C(OMSTOCK)

Nov. 26, 1888- United States Ambassador to Italy

Address: b. c/o Department of State, Washington, D.C.; h. 3308 R St., Washington, D.C.

Diplomacy has been called America's first line of national defense. Hugh Gibson, former United States Ambassador to Belgium and author of *The Road to Foreign Policy* (1944), has said that a trained diplomat defends a nation's interests just as definitely as do its soldiers. One of the career diplomats in the United States Foreign Service is Alexander C. Kirk, a veteran of almost thirty years in that highly specialized profession, who was appointed United States Ambassador to Italy in November 1944. He is the first American ambassador to be sent to Rome since the severance of diplomatic ties between the United States and Italy upon Italy's entrance into the Second World War in 1940 as an ally of Nazi Germany. Ambassador Kirk's appointment not only re-established formal diplomatic relations between Italy and the United States, but confirmed United States recognition of the Government of Premier Ivanoe Bonomi '44 and brought the United States into the difficult problems of Italy and other unstable governments of liberated Europe.

Alexander Comstock Kirk was born in Chicago, Illinois, on November 26, 1888. His father was James Alexander Kirk, a successful soap manufacturer; his mother was Clara (Comstock) Kirk. At the age of nine the boy studied a short time at the Chicago Art Institute. *Life* reports that he made an early business debut as order boy in the family soap factory, a job given with the understanding that he remain incognito. When his identity became known some months later, Kirk returned to his studies and traveling with his mother and young sister, who liked to spend several months each year in Europe. During the summers his reading was guided by an English tutor. Kirk had his first formal schooling at the University of Chicago; after a year he went to Yale, from which he was graduated in 1909. The future diplomat then went to Paris to study at l'Ecole Libre des Sciences Politiques, from which he received a diploma in 1911. He returned to America to study at Harvard Law School, received the degree of LL.B. from Harvard in 1914, and was admitted to the bar in Illinois.

ALEXANDER C. KIRK

Not caring for law, however, Kirk took the first step in his diplomatic career by becoming private secretary to the Third Assistant Secretary of State in March 1915. Then, after passing the State Department examination, he was assigned in August 1915 to his first post abroad, that of secretary at the American Embassy in Berlin. Following two years in Berlin, Kirk went to the American Legation at The Hague for a year; in 1918-19 in Paris he was attached to the American Committee to Negotiate Peace. Returning to America. he served as assistant to the Secretary of State in Washington from December 1919 to February 1920. From the Capital Kirk was assigned to the American Embassy in Tokyo. The two years in Japan (1920-22) were followed by one year in Peking (now Peiping). When he returned from the Orient, Kirk was sent to Mexico City in 1924 for a year as first secretary of the Embassy there. During the next three years he held various State Department positions in Washington: he was assistant to the Under-Secre-

KIRK, ALEXANDER C.—*Continued*

tary of State, vice-chairman of the Board of Review for Efficiency Ratings, and executive officer for the Department.

Kirk, who had seen the Russian Revolution and the collapse of the German Empire after the First World War, returned to Europe in 1928 to fulfill his assignment as first secretary of the American Embassy at Rome. By this time Mussolini ['42] had formed the National Fascist Party and was reaching the height of his power as dictator, reviewing Fascist maneuvers with pomp and ceremony and celebrating the sixth anniversary of the March on Rome. Kirk was made counselor of the American Embassy in Rome in December 1929, and in 1936, the year of Mussolini's conquest of Ethiopia, he became consul general.

A year later Alexander Kirk went to Moscow as consul general, and counselor of the American Embassy there. During this period, when the nineteenth anniversary of the U.S.S.R. was celebrated and the Russians were working out their second Five-Year Plan, Joseph E. Davies ['42] arrived in Moscow as American Ambassador to the Soviet Union. In his book *Mission to Moscow* (1941) Davies tells of the tasks for which he was sent to Russia—the negotiation of the Russo-American trade agreement, the settlement of the Kerensky debt question, and the broader matters of cementing friendly relations between the United States and the Soviet Union, and of gathering information on political, industrial, and military affairs. On June 6, 1938, Davies recorded in his diary: "Discussed the debt situation with Henderson [secretary of the Embassy] and Kirk, in an effort to get down to cases as to just what the proposition was and meant." A few days later he wrote: "Immediately following my talk with Stalin ['42] I took the matter up with Loy Henderson and Kirk. Fortunately they were both familiar with the whole debt question."

When Ambassador Davies left Russia in June 1938 Kirk was still in Moscow, but in the fall of 1939, when Hugh Wilson ['41] was recalled from Berlin, Kirk took his place there. As Chargé d'Affaires he was the chief representative of his Government in Germany for nearly two years—the crucial first years of the Second World War. William L. Shirer ['41], who has written about this period in *Berlin Diary* (1941), tells of the meeting ("a fantastic show") in the Reichstag at which Hitler ['42] eloquently offered peace, with the Nazis as masters of Europe. Shirer's account of the meeting—which was attended by gold-braided generals, Göring ['41] pleased and pompous, and Count Ciano ['40] in gray and black Fascist military uniform, "jumping up like a jack-in-the-box to give the Fascist salute"—includes this description of Kirk: "He sat there all evening, his face like a sphinx, breaking occasionally into an ironic smile when some of his diplomatic colleagues from the Balkans popped up to give the new slave salute."

On May 10, 1940, Belgium, the Netherlands, and Luxembourg had been invaded by the Nazis, and on May 28, Leopold III ['44], King of the Belgians, had surrendered to Germany, an act for which he was bitterly criticized at the time. John Cudahy ['43] had been Ambassador to Belgium during this period. In June Kirk returned to the United States to report on the European situation, and in October 1940 he was formally recalled from Berlin. In November he was appointed to Rome as Chargé d'Affaires, with rank of Minister, to replace Ambassador William Phillips ['40], who had been ill and had left the post in July.

The honorary rank of Minister, a designation not often used in the American diplomatic service, signified a promotion above the post Kirk had formerly held in Berlin and it lent prestige to his position. (Kirk had been promoted in July 1931 to Class 1, the highest class in the Foreign Service, which made him eligible for appointment by the President to the position of ambassador or minister.) At the time of Kirk's assignment to Rome several other changes were made in the Foreign Service in what *Newsweek* called a "diplomatic shuffle"; Joseph P. Kennedy ['40] resigned his London post at this time, William C. Bullitt ['40] resigned as Ambassador to France, Admiral William D. Leahy ['41], retired, was appointed Ambassador to the Pétain ['40] regime at Vichy, and John Cudahy resigned as Ambassador to Belgium.

From Rome Kirk went to Egypt in February 1941 to do double duty as Minister Plenipotentiary and Envoy Extraordinary to Egypt, and Minister to Saudi Arabia. In June 1943 he took on additional diplomatic duties when he was made Ambassador to the Greek Government in Exile then in Cairo. Later, in October 1943, James M. Landis ['43], Director of Economic Operations in the Middle East, came to Cairo with ministerial rank to serve as assistant to Kirk. Kirk was relieved of one of his tasks when Lincoln McVeagh ['41], former Minister to the Union of South Africa, became Ambassador to the Greek Government in Exile in December 1943. In April 1944 President Roosevelt ['42] nominated S. Pinkney Tuck, former counselor of the Embassy at Vichy, to be Minister to Egypt, replacing Kirk, who was then assigned as the American member of the Allied Advisory Council for Italy, with the personal rank of Ambassador. In September he was appointed United States political adviser to the Supreme Allied Commander in Chief, Mediterranean theater. While serving on the Council he was appointed United States Ambassador to Italy in November 1944.

The political situation in Italy, which seemed to be approaching a crisis in December 1944, had become difficult after Italy's liberation from Axis domination and the formation of the Bonomi Government in June. In October Allied diplomatic relations were formally resumed with Italy when the United States, Great Britain, and the Latin American countries extended recognition to the erstwhile Axis partner. American commentators interpreted this action as a desire on the part of the United States to show appreciation for the sympathy of the Italian people during the Second World War, and as an attempt "to bring Italy back into the democratic way of life which she had abandoned for Fascism in 1922." The *Christian Science Monitor* pointed out that it was logical and gracious for America "to lift the military hand" at this time. However, it was also pointed out that in sending an ambassador to Rome the State Department was ignoring precedent, because a state of war declared by Congress on December 11, 1941, had not been officially ended, and that Italy was, therefore, still technically an enemy.

When the Bonomi Government was formed Count Sforza '42 was considered for the position of Minister of Foreign Affairs. His nomination in November, which was vetoed by Prime Minister Churchill '42 (who had supported the Badoglio '40 Government and the monarchy), almost precipitated an international crisis, for Secretary of State Stettinius' '40 declaration made at this time was considered a rebuke to the British Government for interfering in Italian affairs. This declaration stated that the United States had not in any way intimated that there would be any opposition on its part to Count Sforza, and that "it expected the Italians to work out their problems along democratic lines without influence from outside." The United States policy of "abstention" gave the Italian people some concern; according to the press, they were pleased that the United States would not meddle in their affairs, but felt that the Sforza incident had made it clear that they must choose men satisfactory to the British Government, and they wondered whether Italy would be left entirely to British influence if the United States was "washing its hands of Italian politics."

The New York *Times* pointed out that the reason for United States abstention at the time of the Sforza affair was partly a technical one, for, until an ambassador was appointed America could not take any part in the discussion. After his appointment Kirk discussed the situation with Count Sforza, prior to the Count's decision not to be Washington Ambassador. This incident, and many others, made it clear that Kirk would have need of all his diplomatic skill in Italy.

In January 1945 Kirk presented his credentials as American Ambassador to Italy to Crown Prince Humbert '43, Lieutenant General of the Realm, at a ceremony in the throne room of the Quirinal. He thus became the first ambassador to present his credentials since the armistice with Italy in September 1943. There were no formal speeches, but the ceremony, "possibly to show appreciation of the American action," was conducted in the traditionally regal style, except for the absence of the Italian cavalry escort which customarily attends an ambassador from the Embassy to the Quirinal. That month he conferred with Harry Hopkins '41, special assistant to President Roosevelt '42, who had come to Rome to arrange for the expected meeting of the President, Prime Minister Churchill '42, and Premier Stalin '42.

Along with editing and approving the several hundred reports which the American Embassy in Rome prepares weekly, Kirk's busy schedule includes, according to Noel F. Busch in *Life* Magazine, "keeping an eye on the local doings of AMG, OWI, PWB, UNRRA, and other semiautonomous agencies, discharging his obligations to the Allied Commission and the Allied Council, steering clear of epuration trials, integrating his activities with those of Myron Taylor '40 [American envoy] at the Vatican, and explaining United States foreign policy to interested but puzzled natives." While Kirk believes that a sharp line should be drawn between areas of United States and Italian responsibility in postwar Italy, he has urged, along with other Allied authorities, that American forces in Italy be retained during the winter of 1945-46, on the ground that they are required to "stabilize" the situation there. The Ambassador participated in the five-power Council of Foreign Ministers, which met in London in September 1945. Later that year (November) he flew to Washington, where he presumably discussed the Italian interim peace settlement with President Truman '45 and Prime Minister Attlee '40.

With regard to diplomacy of the future, Ambassador Kirk believes that the United States should expand its diplomatic corps numerically and should train its members as technical experts, who would be chosen for "the ability not only to diagnose economic, industrial, and political trends, but also to adjust their dislocations before they can start wars." Suave, discreet Ambassador Kirk is described as "trim-rigged"—"he could not be better dressed if he had nine tailors." Mention of his personal affairs frequently includes references to his inherited "soap millions" and to his ability to buy a fine residence upon his arrival at a new post. He takes with him his collection of paintings, jewels, old furniture, and pipes—of the last-named he has about four hundred. "Kirk's conversation," wrote Busch, "is as witty as it is discreet. His manners are so good that they betray genuine friendliness."

KNIGHT, JOHN S(HIVELY) Oct. 26, 1894- Newspaper publisher

Address: b. Chicago Daily News, 400 W Madison St., Chicago

In the dual role of editor-publisher of four leading newspapers, John S. Knight is a prominent figure in American journalism. Through Knight Newspapers, Inc., he controls a vital segment of the American press in one of the country's "smaller newspaper empires," dividing his time among his publishing enterprises—in Akron with the *Beacon-Journal*, in Detroit with the *Free Press*, in Miami with the *Herald*, and since the acquisition of his latest paper, in Chicago with the *Daily News*.

John Shively Knight was born in Bluefield, West Virginia, on October 26, 1894, to Charles Landon and Clara Irene (Sheifly) Knight. In 1900 the family moved to Akron, Ohio, where the father became advertising manager of the *Beacon-Journal*. By 1915 C. L. Knight had full control of the paper and was writing fiery editorials. As a militant foe of hypocrisy, the elder Knight minced no words in expressing his forthright opinions. Thus John S. Knight has a proud journalistic heritage. Today he enjoys discussing his father's newspaper career, his principles and practices. As a boy, young John worked in the newspaper office during the summer. He was educated at Central High School in Akron and at Tome School in Maryland (1911-1914). In 1914 he entered Cornell University but left college, when the United States declared war in 1917, to enlist in the Motor Transport Corps. Soon he was at the front lines in France, serving with the First and Twenty-sixth divisions. Shortly be-

JOHN S. KNIGHT

fore the Armistice he was transferred to the Army Air Service.

Upon his return to the United States, Knight went to California where for a time he considered taking up cattle raising. His father hoped he would join the newspaper staff, but the young man was not sure that he wanted a career in journalism. Finally, however, he followed his father's wishes and went to work for the *Beacon-Journal* in 1920, reading news exchanges for a year, after which he turned to sports writing. Knight used the pen name of Walker, because, he now confesses, "I was ashamed of the stuff. I didn't write well enough." By 1925, however, he was managing editor, but he continued to work with the "old hands." He wrote some editorials, encouraged in this by his father. During 1925 he also became editorial director of another Ohio paper, the Springfield *Sun*, a post he held for two years. Then in 1927 when his father purchased the Massillon *Independent*, John Knight again became an editorial director. When his father died in 1933 Knight inherited the *Beacon-Journal*. At that time the newspaper was struggling against the depression tide but the son proceeded cautiously in his father's steps, building a solidly successful business enterprise. In the words of one writer: "John Knight has built methodically upon the foundation which C.L. laid impetuously." Extending his newspaper holdings, Knight bought the Miami (Florida) *Herald* in October 1937 for two million dollars. Two months later he arranged to trade his Massillon *Independent* for the Miami *Tribune*, which he then discontinued. (He had purchased it with the intention of suspending publication, for he felt there was not room in Miami for three papers.) Thus the publisher of the *Herald* became the owner of the only Miami morning daily. Having firmly established his publishing interests in Florida, Knight returned to Akron where, in 1938, he eliminated competition to the *Beacon-Journal* by buying out the Scripps-Howard *Times Press*. In this way Knight achieved a press monopoly in Akron, making that city and its suburbs "the largest one-paper community in the country."

Still increasing his newspaper influence, on May 1, 1940, Knight purchased the Detroit *Free Press*, Michigan's oldest daily. He promptly abolished outmoded production methods, and his first order to the staff was "Tell both sides of every story." The complete news coverage of the *Free Press*, circulating in one of the industrial "hot spots" of the Nation, has earned praise from various quarters. R. J. Thomas, president of the United Automobile Workers, commended the newspaper for the fairest labor coverage in Detroit. The *Free Press* was also applauded for its reporting of the race riots in Detroit in 1943, its coverage of every angle of the riots being regarded as "factually fair."

In April 1943 Knight temporarily left his newspaper circuit to become director of the United States Office of Censorship in London. He was in England a year, as liaison man for London and North Africa. For four months after his agreed term had expired he stayed at his post waiting for Byron Price '42, director of the Office of Censorship, to find a successor. Upon his return to the United States, Knight discussed his London experience. Addressing a group of Miami businessmen, he said: "To anyone who has seen a bit of the war, the first impression on coming back to America is one of extreme unreality. I don't think anyone is to blame for that, but our national thinking just has not shaped itself to the point of realizing how grim the war really is over there."

Some months after his return from England, Knight took another step in the newspaper publishing field. In October 1944 he bought a controlling interest in the important midwest daily, the Chicago *Daily News*, from the estate of the late Secretary of the Navy, Frank Knox '40, a transaction involving more than two million dollars. This acquisition presented a certain challenge to Knight. According to *Time*, the *News* had been losing circulation and influence; its twenty-five-story building had a mortgage of more than four million, its financial structure was top-heavy (there was a direct debt of more than one and a half million on the paper itself), and its profits had fallen off greatly. On the other hand the *News* still held prestige as the "New York *Times* of the Midwest" because of its excellent foreign coverage and its tradition of good writing and independence. Knight immediately instituted a number of changes. He appointed as his executive editor Basil L. Walters, whom he had hired in the spring of 1943 as executive editor of the three other Knight papers. One of Knight's specific orders was for "short leads and short sentences." He announced that the newspaper would remain politically independent, adding that it would continue to support the candidacy of Thomas E. Dewey '44 for the Presidency.

In a survey of journalism in *PM* Kenneth Stewart '43 wrote: "With the Hearst and Howard domains past their prime, his [Knight's] is generally regarded as the coming newspaper chain of the Nation." Knight denies any ambition to own a national newspaper chain. Explaining his views he declared: "I don't like chains. We try to maintain each paper's individuality, to present a cross section of the region in which it is published. Editorials are written locally and I think you get better ones that way than when they are handed out from Washington or Park Avenue." Knight's smoothly running and profitable papers are described as "a little daring journalistically, a little liberal politically." The publisher-editor has described himself as a "passionate believer in personal journalism." One of the few writing publishers in the country, he writes a weekly column, *The Editor's Notebook*, which appears in his four papers. He also writes editorials, which have been analyzed as "punchy . . .in short, snappy sentences."

In his plan of allowing each of his papers to keep its identity, Knight favors the printing of much local news. He is a strong advocate of factual, unbiased news columns. Editorially, he is opposed to machine politics, is independent, but not neutral—he says he has no wish to be a "straddler of issues, a do-nothing." In the 1944 Presidential campaign all four of Knight's papers supported Dewey. Knight was a warm admirer of Wendell Willkie '40, his good friend for twenty years. Until six months before Pearl Harbor the Detroit *Free Press* was counted among the isolationist forces, but in June 1941 the paper reversed its policy. In a front-page Sunday editorial Knight declared: "The *Free Press* has opposed every step leading toward involvement in a war which was not of our making. . . .But now the die is cast." Knight further pledged complete support of President Roosevelt as Commander in Chief.

As president of the American Society of Newspaper Editors, Knight has been fighting for world-wide freedom of the press. He appointed a committee of the organization to advance this aim in the platform committees of both the Republican and Democratic conventions in 1944. While he is aware that it will be a difficult goal to attain, the publisher believes that the access of the press to information should be guaranteed by treaty. Of freedom of the press he has stated: "It is one of the greatest challenges of our time. . . .The most powerful thing in the world is truth. If news moves freely, and if controls permitting systematic distortion are rigidly prevented, the people may have an abiding faith that truth will prevail. . . .A free and honest press in every country would contribute greatly toward lessening the chance of future wars." In December 1944 Knight appointed a committee of three editors to make a world tour in the cause of a free press. From January to April 1945 these emissaries of the ASNE traveled forty thousand miles around the world to a dozen countries, where they interviewed government officials and editors in the interest of journalistic freedom in the postwar world. Their report revealed that in practically all cases foreign editors subscribed to the society's views that there be incorporated in the peace treaties a pledge: "Governments not to censor news at the source; not to use the press as an instrument of national policy, and to permit a free flow of news in and out of signatory countries."

In March 1945 when the American Newspaper Publishers Association established a committee on press communications, Knight was appointed to serve on it. Several months later he accompanied six other American newspaper executives to the Pacific war theater as a guest of Secretary of the Navy Forrestal '42 and of Secretary of War Stimson '40, to observe military operations at first hand; their visit coincided with Japan's capitulation. This tour of Pacific bases, Knight stated, convinced him of the necessity of establishing a Government departmemnt of scientific research. Such a department would serve notice on the world that the United States was going to be ready for war if necessary, and it might, he suggested, be even more valuable in preventing war than some of the documents signed at the San Francisco conference. Shortly before the close of 1945 the publisher announced that the Chicago *Daily News* would establish a permanent fund to aid veterans "to relieve individual cases of distress . . . to obtain critically needed items for veterans' hospitals, for gifts or loans to help veterans establish themselves, and in other ways."

John Knight is described as frank and democratic, a manner said to have won him many admirers. Vigorous and energetic, he is a tall, slim, handsome man with graying hair and greenish eyes. He has two sons, Charles Landon and Frank McLain; his eldest son, John Shively, a lieutenant in the paratroopers, was killed in Germany in March 1945. (Their mother was Katherine McLain whom Knight married in 1921, and who died in 1929.) In 1932 Knight was married to Beryl Zoller Comstock. Together with Mrs. Knight's daughter Rita, they live in a large gray brick house in Akron. Knight finds recreation in fishing, swimming, and golfing—he excels in the last-named, for he has won the links championship of his golf club six times. Among his many clubs are the Portage Country Club in Akron, Tin Whistles in Pinehurst, North Carolina, Bath and Indian Creek in Miami, Detroit Economic, and the Burning Tree Golf Club in Washington, D.C. In Chicago he is a member of the Old Elm, Glenview and Tavern clubs. He also belongs to the Veterans of Foreign Wars and the American Legion. When questioned about the incentives to his achievement, he frankly replied that he believed it was pride that stimulated him, explaining that many people in his home town had considered him a rich man's son who would never amount to anything. Therefore, when his father died, Knight said, "I think I just resolved then that I would show them."

KROSS, ANNA M(OSCOWITZ) July 17, 1891- Judge

Address: b. 130 E. 22d St., New York City; h. 124 W. 79th St., New York City

Magistrate Anna M. Kross has been a prominent member of the New York City judiciary for more than a decade. Well known for her sociological approach to the cases brought into her court, she has been in the forefront of the preventive battle against juvenile delinquency for several years, speaking widely on this subject and on crime prevention in general. In 1945 Judge Kross was chairman of the Youth Conservation Committee of the General Federation of Women's Clubs, whose broad youth program aims at coordination of all private and public resources in planning for the youth of the Nation.

Weitzmann & Co.

ANNA M. KROSS

Anna Moscowitz was born in Nishwez, Russia, on July 17, 1891, to Maier and Esther Leah (Drazen) Moscowitz. When she was about two years old the child was brought to America, to which her Jewish parents immigrated to escape persecution. There, in New York's East Side, the girl grew up. With considerable struggle and sacrifice she earned the money for her education: she graduated from Wadleigh High School and then went on to study at Teachers College of Columbia University. At seventeen she taught English to foreigners at the Educational Alliance while studying law at night on a scholarship.

Even as a young girl she was "struck by certain injustices of the law toward children and youth, and determined to do something about it." Awarded her LL.B. by New York University in 1910, she received her LL.M. the following year and was admitted to the bar in 1912. While subsequently engaged in private law practice she became a special investigator for the Women's Night Court in New York. This work won for her an invitation from the Prison Committee of the Church of Ascension to head a group providing free legal counsel for women brought into night court, voluntary work which occupied her during the year 1914-17. In her private practice in these years (1914-19) she also specialized in labor work and acted as counsel for more than eighty unions. Later she organized the Building Trades Compensation Bureau, for which she was legal adviser during the years 1923-25. From 1918 to 1923 she served in the office of New York City's legal department, the Corporation Counsel, when she was assigned to the domestic relations courts. While there she made a significant nationwide survey of family courts. Leaving her municipal post, Mrs. Kross resumed private practice, which she continued for ten years. In 1934 she was appointed judge of the Magistrates Court of New York City and has since established a national reputation as "an outstanding, socially minded member of the judiciary."

The jurist believes that the cases encountered in the magistrates courts are essentially social rather than criminal. In 1937 she sponsored the organization of the Magistrates Courts Social Service Bureau, "to socialize the administration of criminal justice." A voluntary agency which provided assistance to those brought into the courts, the bureau performed a vital service. Another outgrowth of her attitude toward crime and delinquency is the Wayward Minors' Court, which she organized and served for a year as its only judge. This "experimental sociological" court handles the problems of adolescent female delinquency.

In an address at a Teachers Union conference in 1938 Magistrate Kross outlined the part schools can play in crime prevention. Testifying at a hearing before the New York City Board of Education in 1942, she urged a higher school budget. The following year she spoke to the conference of the American Youth for Democracy on juvenile delinquency. As chairman of the Department of Crime Prevention and Social Adjustment of the New York State Federation of Women's Clubs, the judge was busy throughout the war years on the problems of increased juvenile delinquency. After a tour of her state late in 1942 she reported that she had found no authority to cope with this urgent problem. She then addressed an appeal for action to Governor Thomas E. Dewey '44. In March 1943 a committee of the

State Federation of Women's Clubs, headed by the Magistrate, conferred with Lieutenant Governor Wallace, and Judge Kross submitted a crime prevention plan. This plan was described by Albert Deutch of *PM* as an "over-all plan for reducing the existing confusion and waste in children's services."

In 1944 Magistrate Kross was in charge of a national survey conducted by the S.F.W.C. which studied juvenile delinquency. A *PM* article (August 6, 1944) reporting the findings of the study declared that some communities showed a 300 per cent rise in delinquency. Magistrate Kross compared the youth crime wave to the hoodlum-gangster period of prohibition after the First World War. Pointing out that the attempted cures have so far been ineffective, she declared, "Treatment itself is no cure. We need concerted national thinking, planning, and action for a prevention battle. We want a master-key plan, adaptable to the Nation's different patterns of delinquency—urban or rural—coordinating all prevention-treatment work at the local level, focusing responsibility in the community. We want a national youth conservation program." When the General Federation of Women's Clubs inaugurated their postwar youth program in October 1944, Judge Kross became chairman of the Youth Conservation Committee. In April 1945 she attended the discussions held in Washington, D.C., by fifteen organizations for the purpose of establishing a clearinghouse for youth activities. At that time she also conferred with Eleanor Roosevelt '40 on this subject. In July the Judge again met to discuss this issue with Mrs. Roosevelt and Mrs. LaFell Dickinson '45, president of the General Federation of Women's Clubs, and that fall Judge Kross and Mrs. Dickinson visited the White House to discuss the youth program with President Truman '45.

Magistrate Kross, who is a Democrat, has actively participated in many state and national campaigns. During Alfred E. Smith's '44 administration as Governor of New York, she served on his Committee to Remedy Defects in the Law and Its Administration. In 1938 she waged an unsuccessful campaign for a seat on the New York State Supreme Court. An American Labor Party candidate, she was supported by a group of organizations that included the Women's Bar Association and the National Lawyers Guild. She conducted her own campaign, without the aid of a manager, and was actively backed by Mayor La Guardia '40 and various citizens' groups.

The Magistrate's organization affiliations include membership in the National Association of Women Lawyers, in which she has been prominent. As first vice-president in 1940, she attended the association's convention in Philadelphia, where divorce conditions in the United States was one of the principal subjects under discussion. The New York judge later told a reporter, "Divorce conditions in the United States constitute a definite challenge to the women lawyers of this country, and I feel that they can render a fine service to American family life by using their legalistically trained minds in helping find a solution for the literally thousand-and-one complexities in our divorce laws. They can help educate the public." She reported agreement among members on the need for uniformity of divorce laws, but a division of opinion as to whether reform should be the responsibility of the Federal Government or the states. Judge Kross herself favors Federal legislation. In April 1945 the Magistrate presided at the North Mid-Atlantic Conference of the association. Urging that women participate in peace deliberations, she stated, "We women in America want to pledge ourselves that nothing will remain undone in order that unity may be brought about to insure future peace."

Judge Kross is co-author of a series of articles analyzing the scope, function, and procedure of the Magistrates Court. She has written other articles, for the *Journal of Educational Sociology* and the *Reader's Digest* discussion pamphlets. In addition to holding membership in various legal organizations, she belongs to the Women's Democratic Club and the Women's Civic Organization, and she has been a member of the national executive committee of the Zionist Organization of America (1927-29) and the national board of Hadassah (1930-33).

Magistrate Kross is the wife of Dr. Isidor Kross, the New York surgeon, to whom she was married in April 1917; and she is the mother of two daughters, Helen and Alice. She is an expert swimmer and enjoys horseback-riding, skating, and camping. The judge is a voracious reader. Small, with graying hair, she is a woman of great vitality. She impressed one interviewer as a woman who "walked and talked with the definite purposefulness of a person who knew where she was heading."

LAIDLER, HARRY W(ELLINGTON)

(lād'lẽr) Feb. 18, 1884- Economist; educator

Address: b. League for Industrial Democracy, 112 E. 19th St., New York City; h. 292 Garfield Pl., Brooklyn, N. Y.

Believing that the United States should aim to achieve for its people economic security, equal opportunity and genuine democracy, Harry W. Laidler has worked for social reforms and social reconstruction as executive director of the League for Industrial Democracy, as a frequent candidate for office, a city legislator, a lecturer, and an author. His most recent book, *Social-Economic Movements*, published in December 1944, is a comprehensive history of radical ideas and movements from the prophets of the Old Testament and the early philosophers and utopians to the current labor and socialist movements all over the world.

Born in Brooklyn, New York, on February 18, 1884, Harry Wellington Laidler is the son of William Ebenezer and Julia (Heary) Laidler. His grandfather, Stephen Laidler, was a Congregational minister who came to the United States from Manchester, England, in 1865 and worked in the South among the freed Negroes before holding several pastorates in the North. Harry Laidler received his early education in the public

HARRY W. LAIDLER

schools and before he was graduated from Brooklyn Boys' High School he had read much about social problems. He attended Ruskin College for workingmen in Missouri and the American Socialist College in Kansas, but he received his B.A. degree from Wesleyan University in Middletown, Connecticut, in 1907. While at Wesleyan he represented the university on its intercollegiate debating teams and was awarded the Phi Beta Kappa key. Following his graduation he worked for three years as a reporter on the Brooklyn *Daily Eagle*, also studying during these years for the degree of LL.B., which was awarded to him in 1910 by the Brooklyn Law School.

That same year he worked for six months in the law firm of Henry A. Ingraham. He was admitted to the New York bar in 1911. In 1914 he was awarded the degree of Doctor of Philosophy in political economy by Columbia University. His interest in socialism began in high school. He joined the Socialist movement while attending college in the Middle West in 1903, and during the next year and a half combined college studies with lecturing for socialism in Kansas and Oklahoma, as "the boy orator." Returning to the East in the fall of 1904, he entered Wesleyan University, and the following year became one of the founders of the Intercollegiate Socialist Society and formed the Society's first chapter at Wesleyan University. He became the executive of the I.S.S. in 1910, which office he held until 1921. He was editor of the *Intercollegiate Socialist* from 1913 to 1919 and of the *Socialist Review* from 1919 to 1921.

While Laidler has been a nominee for political office a number of times, he has not been particularly successful in politics. As the New York *Post* pointed out, he ran for every office from borough president to governor in twenty years as a Socialist Party stalwart (he was the Socialist candidate for Governor of New York in 1936 and a candidate for United States Senator from New York in 1938), but he had never held an elective office until he served in 1940-41 on the New York City Council as a representative of the American Labor Party and the Socialist Party. When the time came for re-election, he was denied the endorsement of the American Labor Party in Brooklyn, he says, because of his "differences with the party on national issues and because of pressures from influential committee members to secure the party's endorsement for relatives and friends."

Laidler therefore ran for councilman again on an independent ticket endorsed by the Citizens Non-Partisan Committee, the City Fusion Party, the Socialist Party, and many trade unions and civic organizations. Bishop Francis J. McConnell, at that time Bishop of the Methodist Area of New York, was chairman of the Laidler Independent Committee, and Mayor Fiorello H. La Guardia '40, Freda Kirchwey '42, editor of the *Nation*, John Dewey '44, and other prominent liberals testified to Laidler's fine record as a councilman, his lifelong service to the cause of labor, and his specialized knowledge of public utilities. Laidler announced his determination to continue his fight for decent homes for low-income groups, cheap electric and telephone service, elimination of overcrowding in the schools, reorganization of an "archaic" taxation system, more adequate relief, prevention of discrimination on account of color, race, creed or religion, improvement of transit facilities, and the guarantee of the right of collective bargaining. (In 1945 Laidler served as general consultant to the Municipal Affairs Committee of the Liberal Party.)

In order to gain experience and a perspective in his study of these social tenets, Laidler has visited Europe six times to study labor, socialist, and cooperative movements. He was in Prussia in 1929 and attended as observer the Second Anti-Imperialist World Congress at Frankfort, a meeting participated in by communists, socialists, and liberals. Numerous speakers present protested against a capitalist war in the proletarian struggle against imperialism.

Laidler then visited Vienna, where he was greatly impressed by the new housing experiments and by the fact that this city, although war- and poverty-stricken, had been able to eliminate slums and build modern apartments for its workers. By 1931 Laidler had twice been in Russia, visiting the House of Culture, the workingmen's college on the outskirts of Leningrad, the clubhouses for industrial workers, the textile factories, and attending trade union meetings. The intensity of the propaganda within Russia for the Five-Year Plan impressed Laidler as being much greater than the Communist propaganda abroad for world revolution.

The League for Industrial Democracy, of which Laidler is executive director and John Dewey is honorary president, is a nonprofit educational organization committed to a program of "education for increasing democracy in our economic, political, and cultural life. It has given particular attention to democracy in industry. . . .It seeks to encourage every movement in the fields of labor, cooperatives, democratic public control and ownership, social legislation, civil liberties, education, and international organization which aims at the preservation and strengthening of the democratic way of life."

During the Second World War the League has given much time to a "constructive postwar program for the full employment of the Nation's material and human resources for the common good, for an equitable distribution of the fruits of industry, and for international cooperation in behalf of a just and lasting peace." The work of the League consists of research in political, economic, social, and labor problems; of the issuing of pamphlets; and of conferences, lectures, and radio programs. It also acts as an information center on problems of industrial democracy, and in normal years conducts a summer school for students.

Writing in the *League for Industrial Democracy News Bulletin* for October 1944, Laidler, in preparation for the fortieth anniversary year (1945) of the League, described its inception and its development. It was officially born, wrote Laidler, in New York City in the early fall of 1905. At that time Upton Sinclair, then writing *The Jungle* (1906), sent out an appeal for the formation of a society "to promote an intelligent interest in socialism among college men and women." This appeal, which was signed by Jack London, Clarence Darrow Thomas Wentworth Higginson of Harvard, and others, met with a hearty response, and a large group of college graduates and undergraduates met that fall and formed the Intercollegiate Socialist Society. At this meeting London was chosen president; Owen R. Lovejoy, afterward secretary of the National Child Labor Association, became treasurer; and Harry Laidler, then an undergraduate at Wesleyan, was chosen one of the members of the executive committee.

The following year Jack London made a tour of colleges in behalf of the newly formed I.S.S., encouraging students "to think through the burning problems of the age," and not be content with "the passionless pursuit of passionless intelligence." "Fight for socialism or fight against it," he urged. "Raise your voices one way or another; be alive."

The society continued, with desk space in the Rand School of Social Science in New York until 1910. In 1921 it was reorganized as the League for Industrial Democracy. Robert Morss Lovett '43, professor of English literature at the University of Chicago and an editor of the *New Republic*, was elected the first president, Stuart Chase '40 was made treasurer, and Norman Thomas and Harry Laidler were chosen executive directors. (Mark Starr is president of the League in 1944 and 1945.) Writing in 1944, Laidler said: "Of late the League has been greatly strengthening its ties with the organized labor movement—both A.F. of L. and CIO—and today represents a cross section of the progressive forces in all phases of our American life."

In his books and in numerous magazine articles, which have appeared since the year 1930 in the *New Republic, Current History, North American Review, Survey Graphic,* and the *Annals of the American Academy*. Laidler has defined his ideas of socialism and its significance in the social picture. In one article he explains that by socialism, Socialists do not mean rigid centralized industrial mechanism under which all industry is controlled by the state. Instead, they see it as an evolving social order in which the principal industries of a country are socially owned by municipal, state, national, or other community units, and by consumers' and producers' cooperatives, with functional control and as much decentralization as is compatible with efficiency.

In another article Laidler traces the changes in American business and the growth of American monopolies. Business consolidation, Laidler points out, began about 1880 with the foundation of the Standard Oil Company and other "combines." The passage of the Sherman Antitrust Act in 1890 seemed to put an end to consolidation, but only momentarily, and in 1896 a new era came into bloom, a period which saw the formation of United States Steel. From 1904 to the First World War many mergers were achieved, but the movement was less intense. Then the war encouraged big corporations to pool their interests for war purposes, and immediately after the war the third major merger movement developed momentum, continuing until the Wall Street crash of 1929. Postwar development in concentrated control has taken place in the retail distributing businesses (the Atlantic and Pacific chain grocery stores, for example) and in the money trusts. The Federal Reserve System has kept these huge banking concerns under control, but powerful corporations, monopolies of utilities, and large trusts, such as the Ford Motor Company and General Foods have developed.

Laidler sees some good in these monopolies—conditions promoting more research, a better cost-accounting system, greater scientific management—but he feels that organized labor has no firm foothold in these big industries and that employment is not stabilized in them. These large corporations mean greater wealth to the inner group, he thinks, but no security for the worker or the businessman. In 1941 Laidler expressed his belief that there had been social progress in many fields in the United States, despite the crises then threatening in Europe; this was seen in the increasing progress of labor organizations in the basic industries, in the acceptance of the principles of collective bargaining among corporations, and the progress of consumer cooperatives, the decrease in unemployment and increase in minimum wages—and the failure of big business to elect its candidate in the 1940 Presidential election.

Laidler has been a director of the National Bureau of Economic Research since 1920; he was vice-president of the organization in 1928, president from 1930 to 1932, and chairman of the board of directors from 1932 to 1934. Other of his activities include membership since 1924 in the Christian Social Action Commission of the Federal Council of Churches, chairmanship from 1933 to 1936 of the economic committee of the National Advisory Council on Radio in Education, and directorship of the National Public Housing Conference since 1931. He has been a member of the American Labor Conference on International Affairs since 1943, and lecturer in economics at New York University (1942-43), at the College of the City of New York (1942-45), and at Brooklyn College (1943-44). He was awarded an honorary M.A. by Wesleyan University in 1933.

Laidler is the author of many books, among them *Boycotts and the Labor Struggle* (1914), *Socialism in Thought and Action* (1920), *A History of Socialist Thought* (1927), *Concentration of Control in American Industry* (1931), *The Road Ahead—a Primer of Capitalism and*

LAIDLER, HARRY W.—*Continued*

Socialism (1932), *Socialist Planning and a Socialist Program* (1933), *Socializing Our Democracy* (1935), and *A Program for Modern Americans* (1936).

Reviewers of Laidler's most recent book, *Social-Economic Movements*, have pointed out that it is the first comprehensive history of socialist movements (that is, groups advocating radical changes in society) ever published, and that an objective historical survey such as this book is warmly welcomed today when so many millions are searching for satisfactory solutions of the world's social, political, and economic ills. There have been some minor criticisms of the book, but in general it is considered a scholarly, well-organized work. In 1944 he was writing a book on European labor at work, a book dealing with trade unions, cooperatives, and political and educational phases of the labor movement in democratic countries of Europe.

Harry Laidler is a slight man (he is five feet three inches tall and weighs one hundred and twenty-two pounds), and has gray eyes and graying hair. He is considered an unusually lucid and forceful speaker. His favorite recreations are walking, swimming, and tennis. He is a Methodist and a member of Phi Delta Phi and Sigma Chi. In 1919 he was married to Agnes Fuller Armington. They have two children: John Armington and Rosamond.

LANDON, MARGARET (DOROTHEA MORTENSON) Sept. 7, 1903- Author

Address: b. c/o The John Day Co., 40 E. 49th St., New York City; h. 4711 Fulton St., N.W., Washington, D. C.

MARGARET LANDON

When Margaret Landon, the wife of a Presbyterian missionary, was living in Siam (now Thailand) she happened upon two fascinating books, long since out of print, by a Mrs. Anna Leonowens. On these, the memoirs of a Welsh woman who became, in the eighteen-sixties, secretary to Siam's King Mongkut and governess to his sixty-odd children, Mrs. Landon based her story, *Anna and the King of Siam*. The July 1944 choice of the Literary Guild, the book was called startling, exotic, almost incredible, and is probably one of the most unusual first books ever to become a best seller.

Anna and the King of Siam is unusual, too, as the first publication of a woman who began her career as a teacher and missionary. The author was born Margaret Dorothea Mortenson in Somers, Wisconsin, on September 7, 1903, the daughter of Annenus Duabus and Adelle Johanne (Estberg) Mortenson. After attending the Evanston Township High School, she entered Wheaton College in Illinois, where she received her B.A. degree in 1925. For a year afterward she taught school at Bear Lake, Michigan.

In June 1926 she was married to Kenneth Perry Landon, an educational missionary. The following year, under the auspices of the Board of Foreign Missions of the Presbyterian Church, the young couple went to Siam. In the Far East they lived successively in Bangkok, Nakon, Sritamarat, and Trang—Mrs. Landon was principal of the Trang Girls' School for five years. The Landons returned to the United States in 1937. They have four children: Margaret Dorothea, William Bradley, Carol Elizabeth, and Kenneth Perry, Jr.

Mrs. Landon heard much in Siam of the strong-minded Welsh girl who had indoctrinated the royal court, in the eighteen-sixties, with Western ideals of freedom. She then read Anna Leonowens' two books (published in England in 1870 and 1872), *The English Governess at the Siamese Court* and *The Romance of the Harem*. Later she met Mrs. Leonowens' granddaughter, who gave her copies of several old letters; and in the Library of Congress in Washington, she found King Mongkut's letters, published in Siamese. Mrs. Landon based *Anna and the King of Siam* on this material, retaining in the process "something of Mrs. Leonowens' Victorian style, spicing it with her own very modern sense of humor."

The 1860 heroine of this best-selling book of 1945 was Anna Crawford, a young Welsh woman, who was married in India to a British Army officer, Major Thomas Leonowens. In a series of misfortunes she lost two of her children, her husband, and her money. But the twenty-eight-year-old widow had courage—she accepted the King of Siam's offer of one hundred dollars a month and a house to become his secretary and to teach his children and concubines the English language. During her five years in Siam, Anna, who became the "white angel" of the common people, was a one-woman liberalizing force in a feudal court. One of her young concubine pupils was able to translate *Uncle Tom's Cabin* into Siamese, and the Heir Apparent, upon his succession to the throne, abolished the custom of prostration before superiors and freed his slaves.

Although not fiction, *Anna and the King of Siam*, according to Harry Hansen '42, reads like a "refreshing historical novel." Sterling North '43 found the book "a 'natural,' drawing upon the richest vein of untapped material discovered in years. The author's prose lacks professional polish, but the facts of Anna Leonowens' life are sufficiently fascinating to camouflage this lack." William McFee felt that the re-creation of Anna was not successful. "Mrs. Landon has tried hard, but Anna has to a great degree eluded her. We get the external facts and Mrs. Landon's dialogue, but the essential Anna does not appear. . . .Research, like patriotism, is not enough. It takes something more to blow the breath of life into so strange a figure of history." To Lewis Gannett '41, however, it was "a refreshment and a delight" in the field of Victorian melodrama; and John Chamberlain '40 found the book "one of the most remarkable stories ever to be told about that most romantic of centuries, the nineteenth."

Following the success of its American appearance *Anna and the King of Siam* was also published in British and Swedish editions, and negotiations were under way for Spanish, Portuguese, and Dutch translations. The book was also transcribed by the American Red Cross into Braille, and both the American Foundation for the Blind and the American Printing House for the Blind are making it into a "Talking Book." The Theatre Guild in July 1944 acquired stage rights for a forthcoming dramatization. A film version of the book, with Dorothy McGuire portraying the role of Anna, was scheduled to be put into production in the fall of 1945.

Margaret Landon is five feet seven and one-half inches tall, of average weight, with attractive, regular features, deep-set blue eyes, and light brown hair. She and her husband, who serves on the Far Eastern staff of the State Department, have recently acquired a new house in Washington. Mrs. Landon is currently at work on a new book of non-fiction, "Pageant of Malayan History," in the Longmans Green "Pageant of History" series. She is also reported to have near completion a novel (tentatively entitled "One Fainting Robin"), the background of which is again Siam.

LANDOWSKA, WANDA (län-dôf'skä vän'dä) July 5, 1879- Harpsichordist and pianist

Address: b. c/o David Libidins, 113 W. 57th St., New York City; h. 50 Central Park West, New York City

"Since the beginning of my campaign in favor of the music of the past, I have always compelled myself to focus light on the fact that this so-called 'old music' is a living force, sometimes more modern than modern music itself," says Wanda Landowska, the leading harpsichordist in the world today. Her efforts to bring about a greater appreciation of the music of the seventeenth and eighteenth centuries have been almost unrivaled; and her interpretation of these early works, both on harpsichord and piano, is said to make them "sound frequently more contemporary than many written only yesterday."

Born on July 5, 1879, Wanda Landowska is a native of Warsaw, Poland. Her father, Marjan Landowska, was a lawyer and amateur musician; and her mother, Eve Landowska, was a linguist. Wanda began her piano instruction at the age of four. Old music, particularly that of Bach, fascinated the little girl, and her first teacher let her indulge her inclination. When a later instructor, a very "stern and tiresome" man, made her concentrate on Kalkbrenner and Thalberg, the unhappy young Wanda vowed she would someday devote an entire program to the music of Bach. Later her studies were continued at the Warsaw Conservatory, where her teacher was Michalowski, the well known interpreter of Chopin, and at fourteen she was graduated. She made her concert debut in Warsaw, then went to Berlin, where she studied composition under Urban, who was also the teacher of Paderewski, Josef Hofmann, and Rudolph Ganz. "I hardly knew Bach had any contemporaries," she has said. for as a young student she continued to be so devoted to the composer, who was not then very popular, that she was nicknamed "Bacchante" by the famous conductor Nikisch.

At the age of twenty-one Wanda Landowska went to Paris. That year also (1900) she was married there to Henri Lew, the folklorist, who later was to collaborate with her in preparing a book on music of the past. She was a good friend of Charles Bordes and Vincent d'Indy, directors of the Schola Cantorum in Paris, and Mme. Landowska often played in concerts at the school. In her subsequent European tours, writes David Ewen, "she achieved no small measure of fame" as a concert pianist. Meanwhile, the Polish musician since her arrival in France had become an enthusiastic student of the French, Flemish, and English music of the seventeenth and eighteenth centuries. As she studied further she gradually came to appreciate that these compositions should be played on the instru-

Lipnitzki, Paris

WANDA LANDOWSKA

ment for which they had been written, the harpsichord, the immediate precursor of the modern piano. She found that little or no technical material on the harpsichord existed and was thus forced to learn by experimenting how to interpret the old music, or, as she prefers to call it, the music of the past.

The musician commissioned Pleyel, the well known French piano maker, to build her first harpsichord, which was to be an authentic reproduction of the instrument as it was in the middle of the eighteenth century, at the time of its highest development; into the construction, however, would go the skill of the modern craftsman. (The harpsichord has seven medals, and two keyboards of five octaves each, which can be used singly or together.) When the instrument was completed Mme. Landowska began her campaign to reintroduce the classical music to audiences, and to win favor for the harpsichord itself. In 1912 she was called to the newly established Berlin Hochschule as professor of the harpsichord, a post created especially for her. During the war she was detained as an enemy alien, and when peace came she left Germany. After her husband's death in 1919 Mme. Landowska went to Basle, where she gave concerts, lectured, and held classes for advanced students of the piano, harpsichord, and other instruments, interpreting for them the old music. When she left Switzerland she returned to Paris and continued with her concertizing.

In 1925 Mme. Landowska established her own school in Saint-Leu-la-Forêt, a quaint little suburb of Paris, and she built a concert hall on the grounds. Students came from many places to hear her lectures on Bach and to study the piano and the harpsichord under her instruction, mastering the old music scientifically, as she believed was necessary. During the years until 1940, when Mme. Landowska was forced to flee from her adopted country, more than a thousand persons studied at her Ecole de Musique Ancienne, and Saint-Leu became known as a mecca for music lovers. "Her 'French Bayreuth,'" wrote Paul Dambly, "has become a chamber of music in which . . . musical works, so young and so new, by the masters of old, are literally revived." (Mme. Landowska has also lectured on early music in Zurich, Geneva, Barcelona, and Philadelphia.)

Mme. Landowska did not discontinue her concertizing after the establishment of her school; she toured extensively in Europe, Africa, and North and South Americas. She made her North American debut in November 1923, as soloist with the Philadelphia Orchestra under Leopold Stokowski '41. Three concertos were included in the program: one each by Handel and Bach for the harpsichord, and one by Mozart for the piano. "Her exquisite finish is beyond description," commented W. J. Henderson. "Its technical certainty—the sureness of the touch and the perfect suitability of the tonal response to the unerring artistic conception is something that only a musician or a very sensitive listener can perfectly appreciate. . . .She has so thoroughly saturated herself in the spirit of the seventeenth and eighteenth century music that she plays it back into vivid life and present actuality." Pitts Sanborn, writing for *Outlook* in 1930, declared: "Hasn't she even inspired dyed-in-the-wool modernists to compose for her?" Two of these were Manuel de Falla (Concerto for Harpsichord) and Francis Poulenc (*Concerto Champêtre*).

With the threatened occupation of Paris by the Nazis in 1940, Mme. Landowska, a naturalized French citizen, fled to southern France, and eventually to the United States. She left behind her famous collection of ancient instruments, a library of ten thousand volumes, and her dogs, Do, Re, Mi, Fa, Sol, Tempo, and Musette. All her possessions, she later learned, were confiscated by the Germans. Her harpsichord, too, was taken, but a Swiss friend of the musician's was able to secure it and ship it to New York. The harpsichordist's return to the New York concert stage was marked by a performance at Town Hall in February 1942, after an absence of fourteen years, and her audience, consisting largely of musicians, greeted her appearance with an ovation. In his review in the New York *Herald Tribune*, Virgil Thomson '40 wrote: "No matter what she plays it is one of the richest and grandest experiences available to lovers of tonal art. . . . A performance so complete, so wholly interpreted . . . is rarely to be encountered."

After a recital in Carnegie Hall in 1943 the New York *Times* critic pronounced her arrangements "exquisite," while Paul Bowles described her technique as "impeccable." The enthusiastic acclaim of the exacting New York reviewers continued during the next years also. "Bach got a break in Town Hall last night," Louis Biancolli declared after hearing a concert of four of Bach's sonatas for harpsichord and violin, which were performed by Mme. Landowska and Yehudi Menuhin '41 at the end of 1944. "The glory of the concert was Mme. Landowska's playing of Mozart," wrote Olin Downes '43 of a concert she gave in 1945, in which she performed on both piano and harpsichord. At this concert she also presented a work of Haydn's which she had discovered and edited.

Composer as well as editor of music, Mme. Landowska has written songs, piano pieces, and orchestral works. She is a radio as well as concert stage artist, and has made numerous harpsichord and piano recordings, solo and with orchestra, of the works of Scarlatti, Couperin, Rameau, Bach, Handel, Haydn, and Mozart. Since 1905, when she wrote a discussion of the works of Bach for the harpsichord, she has written many books, mostly in French, on the subject of music of the past. One of these, *La Musique ancienne*, was written in collaboration with her late husband. In 1937 the artist was awarded the Grand Prix of the Paris Exposition.

In 1943 Mme. Landowska composed *Liberation Fanfare*, which was arranged for band by Edwin Franco Goldman '42 and played many times in New York's Central Park and Prospect Park in Brooklyn. That summer she also attended the Goldman Band's summer concerts in Central Park, enjoying them so much that she postponed a two-week vacation in order to attend them all. Reporters who have interviewed the artist describe her as a "charming personality," friendly and cordial, and with a sense of humor. She likes to talk of her years in Saint-Leu-la-Forêt, which she considers the happiest of her life. Now in America she is again gathering together the things she cherishes—among them her forty-nine volumes of the works of Bach. "Everything begins now to blossom," she told a *Christian Science Monitor* reporter in 1943—"pupils, concerts, friends. Life for me is beginning all over in America."

LANGLEY, ADRIA LOCKE Author
Address: b. c/o Whittlesey House, 330 W. 42nd St., New York City

Adria Locke Langley, author of a 1945 best-selling first novel *A Lion Is in the Streets*, has been a saleswoman for a mail order house, an organizer of civic groups, a relief investigator, and a war worker—work and interests which took her through the South, the Southwest, and into the crowded sections of New York City. The material of her travels—the study of Americans at work and out of work and in politics—became the substance of her book.

Zamouzakis, Hollywood
ADRIA LOCKE LANGLEY

Adria Locke was born in Iowa, the youngest of three children. When she was still a young child the family moved to Stanton, a small town in Nebraska, and there she grew up. Her father, William Locke, was the president of the Omaha livestock market. He was a Quaker, with a Quaker's idea of what a woman's place should be, and thus it was her maternal grandfather, Thomas Glendenning, modern despite his patriarchal years, who greatly influenced the girl in her future social consciousness. Grandfather Glendenning used to take his eager grandchild to visit and explore his native South. She was sent to Fremont College, in Nebraska, from which she received a teaching certificate after two years. Still too young to qualify as a teacher under the Nebraska laws, she instead entered Northwestern University, from which she was suspended, says interviewer Clip Boutell (New York *Post*), for holding a séance.

Miss Locke was married while still in her teens, and in 1929 she divorced her husband. With only $228.02 to support herself and her eight-month-old daughter, Adria Langley took a job selling a merchandise control system to department stores from Texas to New York. For almost a year she traveled through the South, selling the system so successfully that, on a salary-plus-commission basis, she earned eleven thousand dollars the first year. It was during this period of traveling that Mrs. Langley began attending town hall meetings wherever she happened to be. She became actively interested in a movement for prohibition reform and wrote an article about the work women were doing to combat the corruption of the dry era. As a result of her article she was invited to work with the Women's Organization for National Prohibition Reform in upper New York State, and she was personally responsible for signing up two hundred thousand women in the movement. Those were exciting days, which Clip Boutell describes: "Mrs. Langley was denounced by the local

LANGLEY, ADRIA LOCKE—*Continued*

gangsters as a Red and was jailed by the police in Cooperstown. She was shot at (the bullet smashed the windshield of her car) and she received a hundred and seventeen threatening letters in a single summer."

Her work with the Women's Organization for National Prohibition Reform led to field work for a group of anti-prohibition Congressmen, and by 1933 she was publicity director for the New York State Democratic Committee. Then in 1934 Mrs. Langley, by now a veteran crusader, took up the fight of the New York Dairymen for a price minimum on their products, and she saw to it that the case was brought to court in Albany. She herself appeared to testify in a wheel chair, having just been operated on for appendicitis. "I was just so burned up because no one would stand up for the farmers!" she said.

Her next job was as relief investigator in New York City. There her daily observations of the city's poverty so disturbed her that she wrote a series of articles for the New York *Post*, which evoked a "You can write!" from the editor. Mrs. Langley was convinced of the needlessness of the poverty she saw in the great city and elsewhere in rich America. "The trouble with America has never been overproduction. The trouble is obstructed consumption. When you see peaches being dumped . . . and oil being poured over lemons in California, and then you see hungry children, you know that something is wrong." But Mrs. Langley has also expressed her confidence in America, certain that it can right itself. "If we could solve the problems of money and distribution, we could get at the cause of war. . . .America ought to be able to solve these problems and it should be her destiny to show the answer to the rest of the world." The two great sores of America, Mrs. Langley feels, are poverty and demagoguery; and her novel *A Lion Is in the Streets*, aimed particularly at the latter, is the expression of the author's convictions.

A Lion Is in the Streets, published in the late spring of 1945, is a "first" novel in several respects: it is Mrs. Langley's first attempt at fiction; it was first on the best-seller list for a number of weeks; and it is the first novel to have its screen rights sold for as high as two hundred and fifty thousand dollars. The conditions under which the novel was written were unique. According to the author, the greater part of the book was written between the hours of twelve, midnight, and five in the morning. Her successive daytime jobs during that period were highly different: she worked in an advertising agency, taught psychology in a Long Beach (California) school, and worked as a riveter in a war plant at Santa Monica. For months she went to bed at nine, got up at midnight and wrote until five in the morning, when she would go to sleep again for two hours and then report for work. Since this schedule could not be continued indefinitely, five women friends managed to raise eight hundred dollars to enable her to devote full time to the book.

As the book took form, the author read the manuscript to groups of fellow war workers at one of the homes, where the friends would listen to the story of the rise to power of Hank Martin, "a robust tale, full of the untamed coarse eloquence of a backwoods spellbinder." Mrs. Langley, says Harry Hansen '42 of the New York *World-Telegram*, has put life into a novel of politics. "Her story shows how dictators rise on the feelings of the common people and fall when the honesty inherent in democracy catches up with them." Mrs. Langley's method of approach to this exploiting politician is not one of sharp denunciation. Sterling North '43 has written in his review of *A Lion Is in the Streets*: "The most unusual aspect of this novel is the extreme sympathy and understanding which the author shows for the leading character. . . .Her almost Tolstoyan understanding, her real love for people and for America are deeper wellsprings for effective fiction than sheer hatred of fascism." For nearly half of the book Hank Martin is presented as an admirable character. Even when he is only a peddler he is "a king among men," says N. L. Rothman writing in the *Saturday Review of Literature*. Various critics who think that Hank Martin is intended to represent Huey Long have criticized Mrs. Langley for not probing more deeply into the causes that have contributed to the making of such a man, but Mrs. Langley has denied that she intended to write a fictionized account of the career of Long. Martin, she says, is merely the universal demagogue.

Seldom has a book been received with such fanfare as Adria Langley's *A Lion Is in the Streets*. It ran in the *Saturday Evening Post*, eighty-five thousand copies of the book were ordered, and Mrs. Langley was feted by important literary figures before the book was published. In September it was dramatized on the air. To an editor who asked Mrs. Langley how it felt to be the object of so much attention, the author answered with good humor, "The critics haven't read the book yet. My position as an author being entertained before the book comes out is like that of a pet pig being fed and brushed and scrubbed—with all this lavish care, we both aren't sure whether it's for 'Show' or for 'Slaughter.'"

Mrs. Langley's favorite books are the Bible —from which she took the title of her novel (Proverbs, Chap. 26:13)—and the works of Francis Bacon. Described as a hearty, completely unaffected person, the red-headed author admits readily that she is thoroughly enjoying her success. In New York she and her teen-age daughter, Faith, live in a Park Avenue penthouse.

LATTIMORE, OWEN (lă'tĭ-mōr) July 29, 1900- Orientalist; author; educator

Address: b. Johns Hopkins University, Baltimore, Md.

For the second time since he became director of the Johns Hopkins University Walter Hines Page School of International Relations in 1938, Owen Lattimore, in October 1945, was asked to take a leave of absence by the President of the United States. On the latter occasion the Orientalist and writer, a former adviser to Chiang Kai-shek '40, was appointed special economic adviser to Edwin W. Pauley '45, head of

President Truman's '45 economic mission to Tokyo. Since 1942 Lattimore's knowledge and understanding of the Far East—its people and problems—which he acquired in twenty-five years of travel and study in Asia, have proved of value to the United States Government. It has been reported that the only two books on the President's desk when he announced the surrender of Japan to the press were John Gunther's '41 *Inside Asia* (1939) and Owen Lattimore's *Solution in Asia* (1945).

Born in Washington, D.C., on July 29, 1900, Owen Lattimore until 1928 spent only the first few months of his life in his native country. The year of his birth his parents, David and Margaret (Barnes) Lattimore, moved to Northern China, where Lattimore's father was for twenty years in the educational service of the Chinese Government. When the boy was twelve years old he was sent to Europe to receive a western education. He spent two years at a school in Switzerland and then, in 1915, went to the St. Bees School in Cumberland, England. After being graduated four years later, Lattimore returned to China.

In 1920 he took a newspaper job in Shanghai. After two years he began work in Peiping and Tientsin for Arnhold and Company, Ltd., a firm that exported the produce of all of China's frontier dependencies, from Manchuria to northern Tibet and Turkestan. Four years later the young man resigned from his position and turned to exploring and writing about this territory, with which his work had made him familiar.

Before starting on his first long trip Lattimore was married, in 1926, to Eleanor Holgate, whose father, Thomas F. Holgate, was a mathematics professor, and acting president of Northwestern University in 1904-06 and in 1916-18. She had traveled in China with her parents in 1921 and had returned to Peiping three years later to teach in the Chinese schools. At the time of her marriage she was the secretary of the Peking Institute of Fine Arts. The Lattimores, who now have one son, David, spent their honeymoon traveling native style—on horseback, by camel train, and sled—across the hinterland of Mongolia through Chinese Turkestan. They were accompanied on the trip by Lattimore's Chinese servant, Moses. (Mrs. Lattimore's letters to her family were published in 1934 in book form under the title of *Turkestan Reunion.*)

In 1929 Lattimore traveled and studied in Manchuria on a fellowship from the Social Science Research Council; then, for the next three years he studied in Peiping and traveled in Inner Mongolia, first on a fellowship from the Harvard-Yenching Foundation and later on a John Simon Guggenheim Memorial Foundation fellowship, which was renewed for a second year in 1932. That summer he hired a Mongolian servant, Arash, with whom he wandered about intermittently for the next few years. In 1935 Lattimore, Arash, and a traveling companion were given permission to attend the annual memorial services held at the alleged repository of the bones (or ashes) of Genghis Khan. Lattimore and his friend were the first white men to view the shrine, from which they came away unconvinced that the remains of Genghis Khan were really there. Lattimore continued to live in Peiping and travel in China and Inner Mongolia until 1937 when the Japanese occupation made life in China difficult. He returned to the United States and the next year became director of the Walter Hines Page School of International Relations of Johns Hopkins University.

OWEN LATTIMORE

Lattimore, who is regarded as probably the only American with a thorough knowledge of the three frontier regions of China, Manchuria, Sinkiang, and Inner Mongolia, and who is equally at home in the Chinese, Mongol, and Russian languages, was recommended by President Roosevelt '42 in 1941 for the post of political adviser to Generalissimo Chiang Kai-shek. The Chinese leader accepted the President's recommendation, and Lattimore embarked for China for a six-month period.

In late 1942 Lattimore returned to the United States to take a post with the Office of War Information; he became deputy director of the overseas branch in charge of Pacific operations, with headquarters in San Francisco. Within two years, in June 1944, he was on his way back to China and Siberia as a member of Vice-President Wallace's '40 diplomatic party, which completed its mission in July of that year. In the early part of 1945 Lattimore resigned from the OWI post to resume his work at Johns Hopkins University, only to be called back into his country's service in October, when President Truman appointed him special economic adviser to Edwin W. Pauley, head of the economic mission to Japan. Of this appointment *PM* said: "In a long writing career, Lattimore has consistently expounded the cause of democracy in Asia. Acting as adviser to Generalissimo Chiang Kai-shek, he was not afraid to speak up against dictatorial tendencies, and in his new job he can be counted on to oppose the Zaibatsu, Japan's clique of industrialists."

Since 1926, when he resigned from the export firm, Lattimore has made important contributions to the literature on Asia. His first two books, *Desert Road to Turkestan* and *High Tartary,* published in 1929 and 1930 respec-

LATTIMORE, OWEN—*Continued*

tively, were written as a result of the year-long journey taken by the author and his wife. Both of these books were well received by the critics, the first being called "an interesting account" and the second "a fascinating and well-packed book." In 1932 he wrote *Manchuria—Cradle of Conflict*, a study of Manchuria's place in Chinese history and the significance of its relationship to the three types of civilization with which it comes in direct contact: the traditional culture of China, westernization as typified by Japan, and the new cultural influence of Soviet Russia. R. H. Tawney, in the *New Statesman and Nation*, said that the book was "the most learned and penetrating study [of its subject] available in English." Two years later *Mongols of Manchuria*, a supplement to his earlier work on Manchuria, was published. In 1940 he wrote *Inner Asian Frontiers*, a history of China's northern and western frontiers. The next year *Mongol Journeys*, the reminiscences of his years of wandering in Mongolia, came out. It was described in the New York *Times* as "an easily and sometimes beautifully written book." The author collaborated with Mrs. Lattimore on *The Making of Modern China* (1944), a short history of China.

In 1945 Lattimore's book *Solution in Asia* received enthusiastic reviews from the critics. In it the author discusses the future of the Asiatic countries as he sees it. He feels that they do not intend to become the victims of imperialism again and that the Allies must understand their drive towards self-expression and cooperate by helping them take their rightful places in a world of united nations. In an interview with a *PM* reporter, while he was still adviser to Chiang, he said, "Those people [Chinese, Indians and Indonesians] may be illiterate, but they know the kind of world they want to live in. They may not be able to read or write, but politically they are mature." Lattimore criticizes Joseph C. Grew's '41 plan to govern the Japanese people through the Emperor. He believes the Emperor and all his male heirs should be interned in China and a republic set up in Japan. Edgar Snow '41, authority on Far Eastern affairs, wrote in his review of the book: This book brilliantly illuminates the main questions of our time in Asia, and how they could be answered by an intelligent, vertebrate policy. . . . In order to win acceptance for such measures we need a new philosophy in Congress, which in turn (and alone) could impose it on the State Department." The book was also described as an "appeal to Chiang to free himself from the galling yoke [of the Kuomintang] and to set free the democratic forces which have proved effective in northwestern China." In its bulletin to librarians the East and West Association chose *Solution in Asia* as "the best recent book on Eastern peoples." It was also one of the three books selected by the Recommended Book Committee of the Council of Books in Wartime.

In addition to his books Lattimore has written articles on Asia, on such subjects as its geography, history, anthropology, and politics. They have been published in the *Atlantic Monthly, Asia, New Republic*, and *Virginia Quarterly Review*. From 1934 until 1941 the writer was editor of *Pacific Affairs*, the magazine published by the Institute of Pacific Affairs. Lattimore is a Gold Medallist of the Philadelphia Geographical Society and of the Royal Geographical Society of London, and a member of the American Geographical Society and the Royal Central Asia Society. He is five feet eight inches tall and weighs one hundred and seventy-five pounds. Interviewers have described him as tactful and self-effacing.

LATTRE DE TASSIGNY, JEAN (JOSEPH MARIE GABRIEL) DE

(lȧ-tr tȧ″ sē″nyē′ zhäN) Feb. 2, 1889- French Army officer

General Jean de Lattre de Tassigny is not only one of the youngest five-star generals of the French Army, but was regarded by many as General Charles de Gaulle's '40 ablest field commander. With the United States Seventh Army, his French First Army formed the Allied Sixth Army Group in France.

Jean Joseph Marie Gabriel de Lattre de Tassigny was born February 2, 1889, at Mouilleron-en-Pareds (Vendée), birthplace of Clemenceau. Graduated from St. Cyr in 1910, he was a lieutenant in a cavalry regiment at the beginning of the First World War. In September 1914 he was wounded by a lance thrust in the chest but escaped from the enemy cavalry surrounding him, killing more than one German in hand-to-hand combat—slashing them down with a saber his grandfather had carried in the Napoleonic wars. The following year he was transferred to the infantry, and for three years he commanded a battalion of the Ninety-third Infantry Regiment. (By the end of the war he had been wounded four more times.)

After the First World War the young Frenchman participated in the Moroccan campaign at General Poeymiraud's headquarters, and afterward served as chief of staff of the Taza region. He was seriously wounded in the Riff campaign in 1925. A brevetted officer of l'Ecole Supérieure de Guerre, he then served as General Maxime Weygand's '40 chief of cabinet and later as chief of staff of the Fifth Army; before the outbreak of the Second World War De Lattre made himself popular as commander of the 151st Infantry at Metz—a regiment mainly composed of Parisian Communists. He is a Grand Officier de la Légion d'Honneur, and has received thirteen citations for bravery in action.

During the Second World War, De Lattre commanded the Fourteenth ("Iron") Division of Infantry, which distinguished itself at the defense of Rethel and on the Aisne from May 15 to June 11, 1940. His men threw the Germans back in the Aisne three times, and reached the Marne, then the Loire, still resisting heroically. On June 18, just before the conclusion of the armistice, De Lattre went to the French High Command to propose continuing the battle against the Germans by sending the Fourteenth Division either to England or to North Africa. With his plan rejected and the armistice concluded, De Lattre began devoting all his energy to "renovating" the Army of the Armistice and teaching modern methods of warfare. He was too successful to suit Vichy, and in September 1941 he was removed from his post and appointed commander of troops in Tunisia. Several weeks later came the British offensive in Libya; Rommel's ['42] forces retreated before Montgomery ['42], beside whom fought the Free French. By mid-December De Lattre had been informed that the German-Italian High Command was retreating from the region of Tripoli and, believing that Rommel might retreat to the Mareth Line, he ordered all troops under his command to resist any Axis attempt to penetrate into French territory. Once more Vichy apparently became alarmed, and on January 7, 1942, De Lattre was recalled to France and named commander of the Sixteenth Mechanized Division at Montpellier.

He was still military commander of the Montpellier region in France when on November 8, 1942, came news of the Allied landings in North Africa. Certain that the Germans would invade the Vichy zone (and perhaps believing that the Allied invasion of metropolitan France was at hand), he ordered dispositions for battle in an attempt to delay any German advance to the Mediterranean. He did succeed in allowing many anti-Nazis to escape to North Africa by way of the small port of Sète, which he succeeded in keeping open for a few hours with only two hundred men; but he ended in a Vichy military prison, accused of having attempted a personal *Putsch.* Haled before the State Court, on January 9, 1943, De Lattre was condemned to ten years in prison. At Riom fifty policemen armed with rifles and submachine guns were posted to prevent his escape, on the personal orders of Pierre Laval ['40].

The detailed story of his escape has never been told; but it was accomplished on September 2, 1943, by his sawing the bars of his cell window and letting himself down by a rope. The French underground "railroad" helped him to reach London, and there he concealed his identity so successfully that as late as November the Paris press believed that he was leading a guerrilla force against the Germans in France itself. On December 22, 1943, however, he arrived in Algiers, and there he placed himself at the disposal of General de Gaulle. Later that month he was appointed to head all the French forces in North Africa.

GEN. JEAN DE LATTRE DE TASSIGNY

May 1944 found General de Lattre with De Gaulle on a three-day inspection of victorious French troops with the Fifth Army at the front in Italy, and on June 17, 1944, units of French Army "B" commanded by him disembarked at Elba in the first all-French amphibious operation of the war. Then, on August 15, 1944, came the invasion of the French Mediterranean coast. The first assault troops to land were the Third, Thirty-six, and Forty-fifth divisions, veterans of the Italian campaign, accompanied by French troops under De Lattre's command. Their numbers were not large, for the southern landing was complementary and subsidiary to the northern operations, but they soon won glory for themselves in some of the bitterest fighting that had yet taken place. The original plan had been to assault the port area around Toulon and Marseille six days after D Day, but spies had brought information that the Germans had densely mined these ports and were planning to destroy them and then take up defensive positions in forts outside the towns. De Lattre therefore ordered an assault a day before schedule, in order to cut off the German garrison, with one-half of his forces still not ashore. In cleaning up the region 53,500 Germans were reportedly killed or captured—and at a cost of only one thousand French casualties. General Dwight Eisenhower ['42] himself congratulated De Lattre on the "speed and brilliance" with which the French troops had broken German resistance at Toulon and Marseille, and General Alexander Patch ['43], commander of the United States Seventh Army, called the action a "feat of arms which will go down as an epic in the annals of history." In September 1944 the daring French General was honored by De Gaulle with the Croix de la Libération. In France De Lattre was a hero who found mobs gathered at every town hall to cheer him, while passing French troops tossed out cans of American rations to villagers.

On September 22, 1944, it was announced that De Lattre's army, reinforced by elements of the F.F.I., was prepared for new operations. A week later the French First Army succeeded in breaking through the outer defenses of Belfort Gap in a wide swinging movement from the northwest. For many weeks after this, however, De Lattre's was an almost completely forgotten front. The fighting was bitter, and made more bitter because of bad weather and delay in the delivery of winter equipment. It was not until November 19 that the French First Army succeeded in crashing through Belfort Gap itself, in a sudden advance after weeks of pressure. De Lattre confided later that the French offensive had taken the Germans by surprise: "Our offensive was launched in such a snowstorm the Germans could not possibly imagine we would have the

LATTRE DE TASSIGNY, JEAN DE—*Continued*

audacity to spring upon them." Belfort and Metz had been considered two of the strongest fortresses on the eastern border of France, Belfort being ringed by more than a score of formidable satellite forts which have never been taken by storm since their construction by Louis XIV. Actually Prime Minister Winston Churchill's '42 visit to De Lattre's army in the Vosges on November 13 had served as a pretext for moving a great number of troops and quantities of artillery "for the parade."

By December 1, 1944, the general Allied offensive had driven the Germans from all but about three thousand square miles of France—less than 2 per cent of the country's area. As for the American Seventh and French First armies, they were also pushing the drive on Alsace, of which the Germans still held a fifty-mile stretch. According to De Lattre's estimate, the equivalent of three German divisions had already been destroyed by his army alone, which, he claimed, had killed ten thousand Germans and captured fifteen thousand; two German divisions or their equivalent in manpower were still fighting on the French Army's front. By the end of December, however, the Germans were still trying to tie up the southern half of the Sixth Army Group by forcing some limited withdrawals, and by hanging on obstinately to a six-hundred-square-mile bridgehead across the Rhine around Colmar, apparently figuring that so long as they held this bridgehead the French could undertake no other major move.

Aware of the threat which the existence of a German bridgehead in Alsace meant to his army and to the whole Allied front, General de Lattre insisted on launching an attack to reduce the pocket of Colmar, in which he met with the full agreement of General Devers and General Eisenhower. The Twenty-first Army Corps, including such famous American divisions as the Third, the Twenty-eighth, the Seventy-fifth, and the Twenty-eighth Armored, were placed under his command as reinforcements. In the last days of January, despite bad weather, the attack against the German defenses was launched. A fortnight later Colmar was captured and the Nineteenth German Army thrown back on the right bank of the Rhine, leaving 23,000 prisoners in Allied hands. Won under the most difficult circumstances, this victory has been called the "Victory of the Will." Late in March De Lattre broke through the Siegfried Line, crossed the Rhine, and drove over the Danube more than three hundred kilometers into German and Austrian territory. Within twenty-five days the Nineteenth and Twenty-fourth German Armies were defeated, Baden and Württemberg invaded and occupied, and 175,000 Germans captured, among them thirty-four generals.

From September 1944 General de Lattre never ceased to welcome in the ranks of his Army the volunteers or the small units which had fought in the Maquis. Though poorly armed and equipped with parachuted or captured material, they were trained in front-line fighting. Like their ancestors, the volunteers of the French Revolution, they proved themselves to be gallant soldiers. The success of this newly amalgamated army is seen as a tribute to General de Lattre's leadership. The General, who had attended the signing of the surrender of Germany on May 9, 1945, was made commmander of the French occupation forces in Germany. Late in November of the same year the French Cabinet appointed him Inspector General of the Armies and Chief of the General Staff.

Long-faced, large-nosed General de Lattre has been described by Pertinax '40 as "a man of brilliant intelligence with a magnetic personality." Jacob L. Devers '42, the American general, paid a tribute to De Lattre when he called him the "Liberator of Alsace."

MULLER, PAUL (HERMAN) (mül'ẽr poul hẽr'män) Jan. 12, 1899- Swiss chemist

Address: b. c/o J. R. Geigy, S. A., Basle, Switzerland

"Soldiers have rarely won wars," said Hans Zinsser in his *Rats, Lice, and History*. "They more often mop up after the barrage of epidemics. . . .War is today, as much as ever, 75 per cent an engineering and sanitary problem, and a little less than 25 per cent a military one. Other things being approximately equal, that army will win which has the best engineering and sanitary services." In the Second World War, where Allied troops fought in all parts of the earth and Allied medical officers therefore had to cope with nearly every disease there is, one of the most powerful defensive weapons was the insecticide DDT, which became a peacetime staple. First used by the United States forces when the Japanese conquest of Malaya cut off supplies of the usual pyrethrum and rotenone, with a corresponding scarcity of copper and arsensic, DDT proved to be a "really phenomenal" insecticide. Developed in 1939 by the Swiss scientist Dr. Paul Müller, under the direction of Dr. Paul Läuger, it has been in commercial use since that time. "The public health potentials of DDT are enormous," writes Dr. Iago Galdston. "DDT will, for example, protect cloth against moths . . . will protect trees and plants against many insect pests. . . .But DDT more directly affects health in its extraordinary power to destroy disease-transmitting insects such as flies, fleas, mosquitoes, ticks, and other bloodsuckers."

Paul Läuger, who directed the research which produced DDT, was born in Basle, Switzerland, on January 16, 1896. He is the son of Lorenz and Emma (Dätwyler) Läuger. After attending the public elementary and high schools of Basle, he entered Basle University, where he majored in chemistry; he also studied physics, mathematics, zoology, and botany. In 1918 young Läuger became assistant in the department of organic chemistry. Majoring in that subject, he was graduated in 1919 with the Ph.D. *summa cum laude*, and he is described as the ablest student of chemistry ever to have studied there.

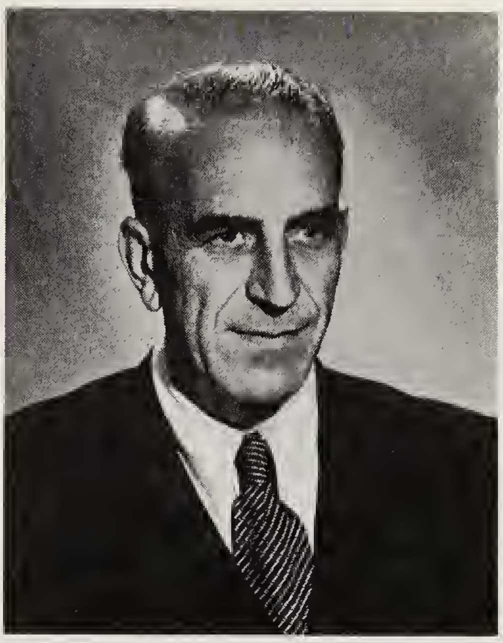
After graduation Dr. Läuger joined the firm of J. R. Geigy, also in Basle, an old company with branches all over Europe and in America, which manufactured and distributed dyestuffs and which was staffed with eminent scientists. For the next twelve years the chemist did research on azo-triphenyl-methane and chinonimid dyestuffs, and in that period invented what he modestly dismisses as "different groups of dyestuffs." In 1930-31 he began his research in the field of insecticides, working on mothproofing agents and also textile auxiliaries. Then Läuger drew up plans on which the company's future research in the entire insecticide field was to be based.

In 1933 Läuger was made assistant manager of the Geigy company and appointed chief of research in four new departments: synthetic tanning agents, insecticides, textile auxiliaries, and certain dyestuffs. Four years later he was promoted to chief of research of all departments, including dyestuffs, coloristic work, and biologicals; at the same time the forty-one-year-old chemist was elected to the board of directors. In 1939 (the year Dr. Paul Müller of his staff discovered DDT) Läuger added pharmaceutical research to his responsibilities. As of 1945, his staff of sixty-five research scientists is at work in two large laboratory buildings on organic synthesis, pharmacology, bacteriology, physiology, zoology, phytopathology, physics, and other research. Läuger has written extensively on sulfonamides, mothproofing agents, and insecticides, in collaboration with his co-workers in the field. In 1944, when DDT had become a household word, the University of Basle conferred an honorory M.D. upon its distinguished graduate for his direction of the Geigy research laboratory.

The actual inventor or rediscoverer of DDT, Paul Herman Müller, was born January 12, 1899, in Olten, Switzerland. His parents were Gottlieb Müller, an official of the Swiss Federal Railroads, and Fanny (Leypoldt) Müller. After attending the Free Evangelical Elementary School and Teachers College, he left college at seventeen and entered the employ of Dryfus and Company as assistant chemist in the Cellonite Society, where he worked a year in the testing laboratory of the Lonza Electric Works. Returning to Teachers College in 1918, he passed final examinations in 1919.

Next came postgraduate studies, first under Professor Fichter in the department of inorganic chemistry, and in 1922 in organic chemistry under Professor H. Rupe. During this period, in 1921-22, young Müller was assistant lecturer to Fichter on rare metals. Having passed examinations in inorganic, physical, and organic chemistry, Müller became third assistant to Fichter in the college's inorganic chemistry laboratory, while the Professor encouraged and directed his work (1923-25) on "The Chemical and Electrochemical Exidation of as.m-Xylidins and its Mono-and Di-methyl Derivatives."

In May 1925 Dr. Müller entered the Geigy firm as assistant manager of the dyewood department. Here he worked on developing synthetic tanning substances, which led in the period 1930-32 to the production of Irgatan G, Irgatan FL, and Irgatan FLT. Müller next turned his attention to disinfectants, and in 1936 worked on the problem of protecting plants against pests. Three years of work culminated in the discovery of a seed mordant, named Graminon, and of the insecticides Gesarol and Neocid, which contained the substance now known as DDT.



A. F. Sozio

PAUL LAUGER

"The first compound found to have outstanding contact effectiveness," says Müller of his discovery, "was 2,2-diphenyl 1,1,1, trichloroethane. . . .While the Geigy Laboratories had for years been using the clothes moth for biological tests, I used flies chiefly. This compound was found to be very effective against flies. Many substances in which the phenyl group was substituted in para position were made, and finally amongst many other compositions I synthesized DDT"—dichloro-diphenyl-trichloroethane, or 2,2 Bis (P-Chlorophenyl) 1,1,1, Trichloroethane. It was later found that a German student had synthesized DDT in 1874, but had not put it to any practical use.

Müller's experiments showed that DDT solutions and emulsions were effective, and that a powder formed of 3 to 5 per cent DDT in an inert carrier like talcum or chalk was more effective than pure DDT. A spray was made of water and extremely slight concentrations of a "wettable dust" of DDT, which were very effective against the imported cabbage worm and the Colorado potato beetle and its larvae. Tests showed that DDT was a contact poison of "astounding effectiveness," which remained lethal to insects for months after application, was unaffected by water, and could be removed with alcohol, oil, kerosene, or other organic solvents.

After extensive testing, Dr. Robert Wiesmann of the Government's Agricultural Experiment Station at Wädenswil, Switzerland, published the first important papers on the effectiveness of the DDT insecticide Gesarol. (Wiesmann later became the Geigy company's

LAUGER, PAUL, and MULLER, PAUL —*Continued*

chief entomologist.) The first commercial use was in Switzerland in 1939, to combat the Colorado potato beetle. When bands of refugees from the Nazi invasion began streaming across the French border into Switzerland, the authorities used a DDT compound, Neocid, in delousing them.

In October 1942 J. R. Geigy's New York subsidiary notified the Washington officials of their insecticides. Their claims were verified by Department of Agriculture tests, and DDT manufacture was started in April 1943. That December its products were rushed to Naples for use by the Allied military governor, Brigadier General Edgar Erskine Hume '44, in checking a threatening epidemic of typhus. What made DDT famous, however, was its employment by the United States armed forces, who used airplanes to spray it over South Pacific islands and atolls before invasion, thus protecting the troops from malaria, typhus, dengue, filiarasis, and other insect-borne diseases. Such a development was obviously of the first importance; reported by war correspondents, it made DDT a household word and alarmed wildlife ecologists who feared its indiscriminate postwar use. Ninety per cent of all insects are beneficial, they pointed out, performing such functions as pollination, while the birds and animals which eat insects "make up one-half the base that supports the whole natural economy. . . .If DDT should ever be used widely and without care," said Richard Pough, "we would have a country without fresh-water fish, serpents, frogs, and most of the birds we have now." The Geigy chemists therefore turned their attention to developing some means of immunity from DDT for the beneficial insects.

A. F. Sozio

PAUL MULLER

The United States Government invited Läuger, Müller, and Wiesmann to confer with American scientists and officials, and the three Swiss scientists arrived in July 1945. At a press conference in late August, before their return, Müller answered questions through his colleague Läuger, who speaks fluent English; and the two posed for pictures, which show Müller as slight and dark, with a boyish smile, and Läuger as taller and broader than his colleague, silver-haired, and looking like a handsome and non-sinister Boris Karloff '41. Paul Müller is five feet ten inches tall and has brown hair and eyes; he is married and has three children, and spends his week-ends with his family in the mountains. Paul Läuger, his elder by three years, is an inch taller, with gray-blue eyes and fair complexion. When asked his hobby, he answers, "Work!"

LAURENCE, WILLIAM L(EONARD)

Mar. 7, 1888- Journalist

Address: b. c/o New York Times, 229 W. 43d St., New York City; h. 541 E. 72d St., New York City

The high point of a colorful career, which had its beginnings in a Russian political purge in 1905 and which has included during the last fifteen years the reporting of outstanding events in the world of science, came for William L. Laurence when the United States War Department chose him in 1945 to prepare the atomic bomb story for the public. Science reporter at large for the New York *Times* since 1930, in 1940 he had scooped the daily press with the first article on uranium fission.

William Leonard Laurence, as he has been known for most of his life, was born to Lipman and Sarah (Preuss) Siew, devout orthodox Jews, in Salantai, Lithuania, on March 7, 1888, when that country was politically a part of Russia. His intellectual tendencies showed themselves while he was still a young boy, and his resolve to come to the United States was taken during his early teens. The story, as told in the *New Yorker*, is that this decision resulted from the gift of a book dealing with a possible Martian civilization: it so kindled his imagination that he determined on establishing contact with Mars—which he thought could best be done from the United States. He soon had his opportunity. A political purge in 1905, when he was seventeen years old, forced him to flee Salantai. He finally landed in Hoboken, New Jersey, with, it is said, no more than fifty cents in assets. His destination was Boston, the fame of which city as an intellectual center had spread to Lithuania. To obtain the railroad fare young Siew found work in a Brooklyn textile factory. Arriving in the Hub, he secured a job with a florist and was soon sent on the errand across the Charles River which was to change his destiny, for it was while delivering a funeral wreath in Cambridge that he passed Harvard University and determined to study there. In 1906 he moved to Roxbury, a suburb of Boston, and lived on Lawrence Avenue, from which, changing the *w* to *u*, he took his surname at that time.

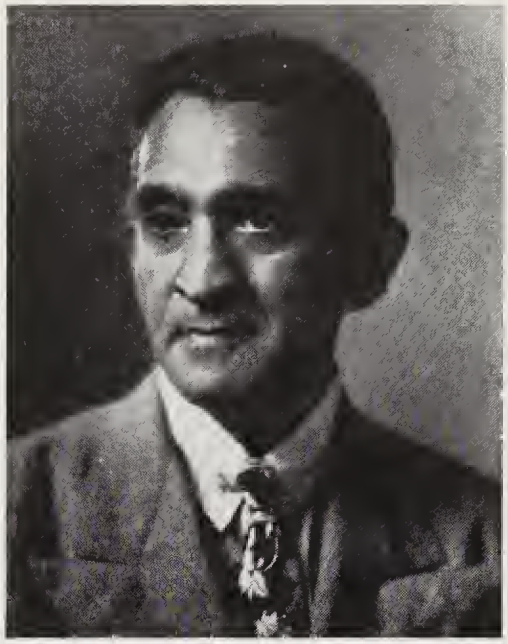
Having earned the money necessary for his tuition and expenses, the youth enrolled at Harvard in 1908. Majoring in philosophy, he studied under such eminent teachers as Palmer, Royce, and Santayana '44. While lack of funds forced him to drop out in 1911, he re-entered the university in the spring of 1914 and completed his course of study the next year. However, having neglected to fulfill all the university's requirements for graduation, he was not given a degree but was awarded the distinction of *cum laude* in philosophy instead.

Meanwhile, in 1913 Laurence had become a naturalized American citizen. The tutoring career which he followed for the next several years began during his final year at Harvard, when just before examinations two football players approached him for coaching in philosophy. When Laurence agreed they returned with forty-eight of their comrades and, grouped on the lawn below Laurence's window, listened to a six-hour lecture. So enthusiastic were the athletes that they insisted upon each paying him five dollars and receiving similar instruction the following day. Laurence's fame as a tutor soon spread, and shortly after commencement he was employed by the Roxbury Tutoring School, which was about to establish a branch in Cambridge. Until he joined the Army in 1917 Laurence tutored Harvard students in philosophy, psychology, and Russian literary history, and engaged brilliant Harvard undergraduates, notably chemistry student James Bryant Conant '41, to assist in other fields of learning.

Concluding a year's training course in the United States in 1917-18, Laurence went overseas in 1918 with the 301st Field Signal Battalion of the Seventy-sixth Division, United States Army. In France he intercepted and decoded German wireless dispatches and wrote the texts of surrender invitations which were dropped from the air behind the German lines. "After the Armistice," says the *New Yorker*, "he received fleeting attention when he went AWOL, informally liberated the city of Metz, and occupied it for five days, until Marshal Petain '40 arrived to relieve him." Then, during part of 1919, he studied at the University of Besançon in France at Government expense.

Returning to Cambridge that summer Laurence founded the Mt. Auburn Tutoring School with the soldier's bonus he received from Massachusetts. For two years he continued as its director and one of its instructors, but in 1921 he closed its doors and entered the Harvard Law School. Although he received his LL.B. in 1925 from Boston University, to which he had transferred, and passed his State bar examination, he did not practice but continued for a while one of the pursuits of his previous four years—free-lance writing and play adaptation. Three of the plays he adapted during this period have been produced: *Mr. Paraclete* (from the Russian of Evreinov) by the Harvard Dramatic Club in 1925; *At the Bottom* (from the Russian of Gorki) and *Devil in the Mind* (from the Russian of Andreyev) in New York in 1930 and 1931, respectively.

Laurence arrived in New York in 1926 with no job in sight. However, through a former student of his a chain of fortunate circumstances led to his inclusion in a party invited to the home of Herbert Bayard Swope '44, then editor of the New York *World*. There Laurence soon found himself engaged in a certain quiz game in which his host excelled. When he vanquished the hitherto invincible Swope, the editor demanded, "Who are you, and why?" Laurence apologized and explained, mentioning in due course that he was unemployed—whereupon Swope hired him as a reporter for the *World*.



WILLIAM L. LAURENCE

Passed on to an unenthusiastic city editor, he nevertheless acquitted himself creditably on stiff assignments—often because he could call upon former students for aid. He located an obscure Russian spy within two hours, for instance, because he had the assistance of a former student who had become an FBI official. Laurence continued as general reporter for the *World* until 1930, supplementing those duties, from 1927 on, with the responsibilities of associate aviation editor; scientific assignments, which he preferred, were, on the other hand, few and scattered. Once, however, his erudition caused him to be assigned to cover a meeting of the American Philosophical Association at Columbia University, at which Professor James MacKaye of Dartmouth was scheduled to read a paper exploding the Einstein '41 theory. Unable to follow the Professor's involved mathematics, Laurence interviewed him after the lecture, obtained the general idea, and wrote the story for the *World*. The article later assured Laurence's appointment as science reporter for the New York *Times* when, in an interview with Laurence in 1930, acting *Times* managing editor Frederick T. Birchall remembered that the *Times* had been scooped on this event because none of its reporters had been qualified to handle it.

Since 1930 Laurence's roving commission for the *Times* has made it possible for him to report science exclusively. Not held to regular hours or deadlines, nor given specific assignments, he covers scientific meetings and culls scientific and technological periodicals for subject matter. He works independently of science editor and columnist Waldemar Kaempffert '43, producing scientifically accurate articles in laymen's language under such headlines as "Chemist Sees Age of Methusalehs" and "Life Is Created Without Parents." Many of his leads come from the letters-to-the-editor columns of prom-

LAURENCE, WILLIAM L.—*Continued*

inent scientific journals, such as the *Physical Review*, in which scientists present tentative theories and conclusions to their professional colleagues. It was a few lines printed in the *Physical Review* concerning the successful isolation of uranium 235 (which established as fact what Laurence had previously learned from the scientists concerned) that led him to write the story of atomic fission and potential atomic power with which he scooped the New York press in the *Times* of May 5, 1940. This account was afterward expanded for the *Saturday Evening Post* of September 7, 1940, causing the FBI to investigate would-be readers of the issue after censorship was imposed on atomic experiments. Laurence has also been first with the stories of the sulfa drugs and penicillin, and it was a hint of his which initiated the Squibb Company experimentation that produced sulfadiazine. It has been said that "perhaps his greatest contribution to human welfare is his reduction of the time lag between scientific discoveries and their useful application."

Gifted with a remarkable memory for scientific detail, Laurence has at times been able to correlate some of the accidental discoveries of scientists too immersed in their experiments to pay attention to happenings outside of their own laboratories. It may be that he recollects that someone to whom he had been talking was seeking information he has just heard. "While it is probable," Laurence once ended an article, "that some if not most of these suggestions are now under consideration, or are being tested, by others, they are hereby presented in the hope that they may prove useful in crystallizing an idea." At another time, his explanation in a *Times* article of iconoscope inventor Dr. Vladimir K. Zworykin's idea for a television supermicroscope made RCA officials realize the value of the invention then reposing in their files. His own chief contribution to scientific theory—the use of avidin to fight cancer—was the result of his correlation of isolated facts concerning cancer, erysipelas, the growth-promoting vitamin biotin, and the antivitamin substance avidin.

One day early in May 1945 Laurence failed to appear in the *Times* office, but only his wife and his managing editor, Edwin L. James, knew that the War Department had asked for his services on a top-priority project. Not until nearly three months later did his colleagues learn that Laurence had been chosen by the War Department to prepare the press releases on the atomic bomb. As the only newspaperman taken into the secret, Laurence during the spring and early summer inspected the various plans which made up the "Manhattan District," visited the Los Alamos, New Mexico, bomb laboratory and witnessed the test bombing on July 16 in the New Mexico desert.

On August 7 there appeared in the *Times* the War Department release beginning, "Mankind's successful transition to a new age, the Atomic Age, was ushered in July 16, 1945"—the *Times* had heard from its reporter. Before returning to his paper. Laurence flew with the airmen who dropped the bomb on Nagasaki and joined the group which investigated the possible persistence of dangerous radioactivity at the New Mexico testing ground. He began in September a series of articles on the development and use of the atomic bomb, for which he received the annual award of the Silurian Society for the best editorial staff achievement in 1945 by a New York City newspaperman. Referring to Laurence's previous long silence, *Time* Magazine had lamented that "he had the story of his, or any newsman's life—but he couldn't write it"; however, Laurence will present this story in a book which he is preparing for publication in early 1946.

Laurence is "a small dark man . . . with a flattened nose," who speaks with a slight foreign accent. He was married on December 19, 1931, to Florence Davidow, daughter of the late Rabbi Joseph Anachowitz, of Lithuania; Laurence describes his wife, who is a graduate of the Pulitzer School of Journalism, "as an excellent cook and a very gracious hostess"; she writes poetry and is working on several novels. Because he has a great fondness for rivers, Laurence has installed in his New York apartment, which overlooks the East River, a series of mirrors arranged so that wherever one looks the water is visible—credit for which he says is largely due Mrs. Laurence. Among his numerous books are autographed first editions of two works of James Joyce, who hid the names of five hundred rivers in *Finnegans Wake.* Laurence also has a liking for gadgets and owns a dachshund which he has named Einstein. And among his possessions one will find a portrait by an Austrian refugee sportively depicting him as the universal mind.

Winner of the Pulitzer Prize in May 1937 for his reporting of the 1936 Harvard Tercentenary Conference of Arts and Sciences, and of a fellowship from the American Institute of the City of New York in 1940 for "a long-sustained pre-eminent record of reporting brilliantly to the daily press the achievements of science and technology," Laurence once humorously summed up his career: "I have been covering news in the realm of science, from astronomy to zoology and intermediate points. The infinitesimal and the infinite, from metagalaxies to microbes, constitute my present domain. I report news about the Einstein relativity and unified field theories, quantum mechanics, the cosmic ray, and the nucleus of the atom. I annihilate the universe with Eddington '41 and Jeans '41 and put it together again with Millikan '40. If you want to know about genes and chromosomes, enzymes, hormones, vitamins, electrons, protons, photons, neutrons, and morons, read the New York *Times.*"

Obituary

N Y Times p1+ N 18 '44

LERCH, ARCHER L(YNN) Jan. 12, 1894- United States Army officer; lawyer

Address: b. c/o War Department, Washington, D.C.; h. 6416 31st Pl., N.W., Washington, D.C.

As of early 1945, the American Army's Corps of Military Police numbered more than two hundred thousand—more men than the entire United States Army six years earlier. Divided into small units, none larger than a battalion, and dispersed in most parts of the world, it performed "more diverse duties than any other branch of the Army." In addition to the always important disciplinary functions, the Second World War MP's acted as "a cross between an information bureau and a nurse"; as detectives, ferreting out spies, saboteurs, and black-market operators; as custodians of war prisoners; as riot control battalions; and as the traffic directors who made fast-moving mechanized warfare possible without breakdowns, or waded ashore on hostile beaches to direct the invading troops. This versatile Corps was headed during the Second World War by Major General Archer L. Lerch, the Provost Marshal General of the United States Army, who in December 1945 was reassigned to Korea as military governor of the American-occupied zone.

U.S. Army Signal Corps

MAJ. GEN. ARCHER L. LERCH

Archer Lynn Lerch was born in Sumner, Nebraska, on January 12, 1894, the son of Herman H. and Maud R. (Stevens) Lerch. His father was an Oakland (California) merchant. Young Lerch attended the University of California, graduating with the B.A. in 1917. Commissioned a second lieutenant of Infantry Section in the Officers' Reserve Corps when the United States entered the First World War in April, he was given a three-month training course in San Francisco, and then assigned to the Sixty-third Infantry there. That October Lerch accepted a commission in the Infantry of the Regular Army, and was immediately promoted to first lieutenant. In February 1918 he was married to Florence M. Wentworth, an Oakland girl.

Lieutenant Lerch spent two months in France with the American Expeditionary Forces, returning to America in January 1919. For the next two years he served at several Army posts, including three months as post adjutant at Fort Ontario, New York, and in July 1920 was promoted to the rank of captain. In May 1922, after an eight-month course at the Infantry School in Georgia, Lerch was stationed at Little Rock, Arkansas, as an instructor in the 153rd Infantry, Arkansas National Guard. After two years in Arkansas the thirty-year-old captain was sent to Cuartel-de-España in the Philippine Islands to join the Thirty-first Infantry.

In June 1926 Lerch returned to his old college, the University of California, where he remained five years as assistant professor of military science and tactics. After this, in September 1931, he went back to the tropics as legal adviser to General H. B. Wells at Hawaiian Department headquarters at Fort Shafter. His official title was Assistant Department Judge Advocate. In 1933 Lerch also became legal adviser to the Public Works Administration in the Territory, and in 1934 was named assistant deputy administrator and execu-

LERCH, ARCHER L.—*Continued*

tive officer for the National Recovery Administration in the Hawaiian Department.

The forty-year-old officer was promoted to major in August 1935. Typical of the United States Army at that time, it was his first advancement in fifteen years. In October he was sent to Fort Williams, Maine, for post and staff duties with the Fifth Infantry. Enrolled in the Command and General Staff School in Fort Leavenworth, Kansas, in August 1936, the future general was graduated in June 1937 and joined the University of Florida faculty as professor of military science and tactics.

In July 1938 Major Lerch transferred from the Infantry to the Judge Advocate General's Department, which handles courts-martial, military commissions of inquiry, and titles to lands owned by the War Department, and provides legal advice for various commands. Lerch's first assignment was to duty in the Military Affairs Section of the Judge Advocate General's Office in the Capital, as executive officer. From September 1938 to June 1939 he attended the George Washington University Law School as additional duty. In 1939 he successfully prosecuted Grover Cleveland Bergdoll, the First World War draft dodger, before a court-martial; and in 1942 the forty-eight-year-old officer received his LL.B. He has been admitted to practice before the bar of Florida and before the Supreme Court. During this period Lerch was promoted to lieutenant colonel in August 1940, and to colonel (temporary) in December 1941, seventeen days after Pearl Harbor. He had been ordered to the Army War College, which gives the country's highest military training, but these orders were revoked when the emergency was declared.

In November 1942 Lerch was appointed commanding officer of the Provost Marshal General Training Center and commandant of the Provost Marshal General School at Fort Custer, Michigan. A month later, with the temporary rank of brigadier general, he was assigned to duty in the Office of the Provost Marshal General in Washington. In May 1944 Lerch was made Acting Provost Marshal General, with the two stars of a major general, and in June became the Provost Marshal General.

As *Fortune* put it in June 1945, "the Provost Marshal General, Major General Lerch, has more major duties than the Pentagon has sides (actually his office is located in the War Department's shabby old Munitions Building). He is directly in charge of the Military Government Division; his other functions fall under three headings, each directed by an assistant provost marshal." The best known of these is that which General Lerch regards as the MP's primary job—to "keep the GI out of trouble." Besides checking on and enforcing military regulations and generally keeping order, the MP is told to "give information and advice, to help wounded veterans with their luggage, to see that soldiers get all reasonable breaks."

One of the MP's peacetime jobs which gained importance in war is "internal security," otherwise riot control, wherever Federal interests or property are threatened, or whenever the President proclaims military intervention at the request of the Governor concerned. The Provost Marshal General, through his Security Intelligence Corps, also cooperates with the Treasury Department's Secret Service and the Justice Department's FBI in investigation, intelligence, and counterintelligence work.

One very important wartime development was the tactical use of MP's. For example, as *Fortune* states, "many a beachhead in New Guinea or on Pacific isles might have been lost if men and supplies plunging ashore out of charnel seas of landing barges had not been guided to their proper places for combat. . . . Many and many a convoy of men and weapons bound for the firing line would have come to grief in the mine fields or stalled before a dynamited bridge if they had not been signaled in time away from the wrong turning, by soldiers who knew the road nets and their conditions like the lines in the palms of their hands." General Patton's '43 spectacular drive across Germany would not have been possible had not MP traffic control made possible such maneuvers as two armored divisions crossing each other at right angles under combat conditions. "Many of these duties are performed not only under fire, but where fire is particularly sustained—at key road intersections and bridges and supply dumps and railroads. As a consequence the MP's in overseas service have acquired their share of combat decorations. Some 40 per cent of the MP's at Anzio, for example, got the Purple Heart."

But perhaps the most publicized and certainly the most unfavorably publicized task of General Lerch's command was the care of prisoners of war. All prisoners, including some taken by combat MP's themselves, were turned over to MP's directly behind the lines; in fluid fighting they could have been very dangerous if not quickly handled and efficiently guarded. It was those German, Italian, and Japanese soldiers in American prison camps whose reputed "coddling" roused a storm of protest in late 1944 and early 1945, brought to a head by the escape of twenty-five Germans from a camp in Papago Park, Arizona. (All were recaptured.) Discovery of the horrifying conditions in the Nazis' internment camps caused many persons to call for retaliatory measures. General Lerch admits that some of his PMG commanders may have erred in overleniency; an instance was the use of dining car facilities by prisoners on trains, which the General termed "a direct violation of our policy."

In answer to criticism, in April 1945 Lerch reported to the public on the entire prisoners-of-war picture. It was governed throughout, he explained, by the Geneva Convention, signed in 1929 and proclaimed as the law of the land in 1932: "If we want to break the Geneva Convention, then why have a Dumbarton Oaks?" He quoted Maurice Pate of the American Red Cross as stating, "The greatest single factor which gives us strength in getting relief and maintaining regular communication with our prisoner kin is the scrupulous attitude of the American Army in fulfilling the Treaty of Geneva toward enemy prisoners"—a conclusion agreed with by the House of Representatives Military Affairs Committee. Moreover, the treatment of war prisoners was known to have influenced many enemy soldiers to surrender, rather than fight to the death.
